

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS'S
ENCYCLOPÆDIA

A DICTIONARY

OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE

ILLUSTRATED

WITH MAPS AND NUMEROUS WOOD ENGRAVINGS

VOL. VI

LONDON

W. AND R. CHAMBERS 47 PATERNOSTER ROW

AND HIGH STREET EDINBURGH

1864

270 i. 19 399. d. 225.

America. To this family belong the Wrasses and the Parrot-fishes, one of which is the celebrated *Scarus* of the ancients.

LABRUYERE, JEAN DE, a French author of celebrity, particularly noted for his nice and delicate delineations of character. He was born at Dourdan, in Normandy, in 1644 or 1646, was brought to the French court at the recommendation of Bossuet, and became one of the tutors of the Dauphin, whose education Fenelon superintended. He spent the whole remainder of his life at court, in the enjoyment of a pension, and in the most intimate intercourse with the most accomplished men of his time. The work on which his high reputation rests, *Les Caractères de Théophraste, traduits du Grec, avec les Caractères ou les Mœurs de ce Siècle* (Par. 1687), has gone through many editions, some of them annotated, and has been translated into several languages.

LABUAN, a member of the Malayan Archipelago, lies about thirty miles off the north-west coast of Borneo. It measures ten miles by five, and the latitude and longitude of its centre are 5° 22' N., and 115° 10' E. Small as it is, it is peculiarly valuable. Besides possessing a good harbour, it contains an extensive bed of excellent coal, which is worked by a recently formed company of British capitalists; and having become, in 1846, a British possession, it bids fair, as well from its political connection as from its natural advantages, to be a nucleus of civilisation for the whole of the surrounding islands. Already it has been erected into a see of the Church of England.

LABURNUM [*Cytisus* (q. v.) *Laburnum*], a small tree, a native of the Alps and other mountains of the south of Europe, much planted in shrubberies and pleasure-grounds in Britain, on account of its glossy foliage and its large pendulous racemes of yellow flowers, which are produced in great abundance in May and June. It is often mixed with lilac, and when the latter preponderates, the combination has a fine effect. In favourable circumstances, *L.* sometimes attains a height of twenty, or even forty feet. It is very hardy, and nowhere flourishes better than in the north of Scotland. It is of rapid growth, yet its wood is hard, fine-grained, and very heavy, of a dark-brown or dark-green colour, and much valued for cabinet-work, inlaying, and turnery, and for making knife-handles, musical instruments, &c. The leaves, bark, &c., and particularly the seeds, are nauseous and poisonous, containing *Cytisine*, an emetic, purgative, and narcotic principle, which is also found in many allied plants. Accidents from *L.* seeds are not unfrequent to children; but to hares and rabbits, *L.* is wholesome food, and they are so fond of it, that the safety of other trees in a young plantation may be insured by introducing *L.* plants in great number, which spring again from the roots when eaten down.—A fine variety of *L.*, called *Scotch L.*, by some botanists regarded as a distinct species (*C. Alpinus*), is distinguished by broader leaves and darker yellow flowers, which are produced later in the season than those of the common or *English laburnum*.

LABYRINTH (a word of unknown origin, derived by some from *Labaris*, the name of an Egyptian monarch of the twelfth dynasty), the name of some celebrated buildings of antiquity, consisting of many chambers or passages difficult to pass through without a guide, and the name hence applied to a confused mass of constructions. In the hieroglyphics, the word *mers* signifies a 'labyrinth.' The principal labyrinths of antiquity were

the Egyptian, the Cretan, and the Samian. The first, or Egyptian, of which the others seem to have been imitations, was situated at Crocodilopolis, close to the lake *Mæris*, in the vicinity of the present pyramid of Biakhmu. According to the classical authors, it was built by an Egyptian monarch named Petesuchis, Tithoes, Imandes, Ismandes, Maindes, or Mendes. The recent discovery of the remains of this building by Lepsius has, however, shewn that the city was founded by Amenemha I., of the twelfth Egyptian dynasty, about 1800 B.C., and that this monarch was probably buried in it, while the pyramid and south temple were erected by Amenemha III. and IV., whose prænomen resemble the name of *Mæris*, and their sister, Sebeknefru or Scemioptia, appears to have been the last sovereign of the twelfth dynasty. Great confusion prevails in the ancient authorities as to the object of the building, which contained twelve palaces under one roof, supposed to have been inhabited by the Dodecarchy, or twelve kings who conjointly reigned over Egypt before Psammetichus I.; while, according to other authorities, it was the place of assembly of the governors of the nomes or districts, twelve in number according to Herodotus, sixteen according to Pliny, and twenty-seven according to Strabo. It was built of polished stone, with many chambers and passages, said to be vaulted, having a peristyle court with 3000 chambers, half of which were under the earth, and the others above ground, which formed another story. The upper chambers were decorated with reliefs; the lower were plain, and contained, according to tradition, the bodies of the twelve founders of the building, and the mummies of the sacred crocodiles, conferring on the building the character of a mausoleum, probably conjoined with a temple, that of Sebek, the crocodile-god, and so resembling the Serapeum. Herodotus and Strabo both jested this edifice, which was difficult to pass through without the aid of a guide. It stood in the east of a great square. Part was constructed of Egyptian marble—probably rather arragonite—and of Egyptian granite pillars; had a staircase of ninety steps, and columns of porphyry; and the opening of the doors echoed like the reverberation of thunder. For a long time, great doubt prevailed whether any remains of the building existed, and it was supposed to have been overwhelmed by the waters of the lake *Mæris*; and although P. Lucas and Letronne thought they had discovered the site, its rediscovery is due to Lepsius, who found part of the foundations or lower chambers close to the site of the old *Mæris* Lake, or modern Birket-el-Keroun. According to Pliny, it was 3600 years old in his days.

The second, or next in renown to the Egyptian, was the labyrinth of Crete, supposed to have been built by Dædalus for the Cretan monarch Minos, in which the Minotaur was imprisoned by his orders. Although represented on the Cretan coins of Cnosus sometimes of a square, and at other times of a circular form, no remains of it were to be found even in times of antiquity, and its existence was supposed to be fabulous. The only mode of finding the way out of it was by means of a hawk or skein of linen thread, which gave the clue to the dwelling of the Minotaur. The tradition is supposed to have been based on the existence of certain natural caves or grottoes, perhaps the remains of quarries, and it has been supposed to have existed north-west of the island, near Cnosus, while a kind of natural labyrinth still remains close to Gortyna. The idea is supposed to have been derived from the Egyptian.

The third of the labyrinths of antiquity was the Samian, constructed by Theodorus and artists of

remains shut up in the cells with the other results of decomposition.

The small twigs, when well covered, are gathered by the natives, and are placed in hot water, which melts the resinous matter, liberates the pieces of wood and the remains of the insects, and also dissolves the colouring matter. This is facilitated by kneading the melted resin whilst in the hot water; it is then taken out and dried, and is afterwards put into strong and very coarse cotton bags, which are held near enough to charcoal fires to melt the resin without burning the bags. By twisting the bags, the melted resin is then forced through the fabric, and received in thin curtain-like films upon strips of wood. This hardens as its surface becomes acted upon by the air, and being broken off in fragments, constitutes the shell-lac of commerce. The best shell-lac is that which is most completely freed from impurities, and approaches most to a light orange brown colour. If the colouring matter has not been well washed out, the resin is often very dark, consequently, we find the following varieties in commerce—orange, garnet, and liver. Much that is squeezed through the bags falls to the ground without touching the sticks placed to catch it; small quantities falling form button-like drops, which constitute the *button-lac*; whilst larger ones, from an inch to two or three inches in diameter, constitute the *plate-lac* of commerce. That known as *stick-lac* is the twigs as they are gathered, but broken short for the convenience of packing.

Below the lac-bearing trees there is always a very considerable quantity of the resin in small particles, which have been detached by the wind shaking and chafing the branches; this also is collected, and constitutes the seed-lac of our merchants.

The water in which the stick-lac is first softened contains, as before mentioned, the colouring matter of the dead insect. This is strained and evaporated until the residue is a purple sediment, which, when sufficiently dried, is cut in small cakes, about two inches square, and stamped with certain trade-marks, indicating its quality. These are then fully dried, and packed for sale as *lac-dye*, of which large quantities are used in the production of scarlet cloth, such as that worn by our soldiers; for this purpose, lac-dye is found very suitable.

The lac insect is a native of Siam, Assam, Burmah, Bengal, and Malabar; the lacs and lac-dye come chiefly from Bombay, Pegu, and Siam. During the last two or three years, the average imports into Britain have amounted to about 610 tons of the lac-dye, and 1120 tons of lac, including the varieties of shell, stick, and seed lac.

As we have no strictly analogous resin from the vegetable kingdom, not even from the lac-bearing trees, it may be assumed that the juices of the trees are somewhat altered by the insects. The best analyses shew that shell-lac contains several peculiar resins. The great value of the lacs is found in their adaptability for the manufacture of varnishes, both in consequence of their easy solubility, and also because of the fine hard coating, susceptible of high polish, which they give when dry. The well-known 'French polish' is little more than shell-lac dissolved in alcohol; and a fine thin varnish made of this material constitutes the lacquer with which brass and other metals are coated, to preserve their polish from atmospheric action.

All the varieties of lac are translucent, and some of the finer kinds, which are in flakes not much thicker than writing-paper, are quite transparent, and all, as before stated, are coloured various shades of brown, from orange to liver. Nevertheless, if a quantity of shell-lac be softened by heat, it may,

by continually drawing it out into lengths, and twisting it, be made not only quite white, but also opaque; in this state it has a beautiful silky lustre; and if melted and mixed with vermilion, or any other colouring matter, it forms some of the fancy kinds of sealing-wax: the more usual kinds are, however, made by merely melting shell-lac with a little turpentine and camphor, and mixing the colouring matter. Shell-lac has the property of being less brittle after the first melting than after subsequent meltings; hence the sealing-wax manufactured in India has always had a high reputation, and hence also the extreme beauty and durability of those Chinese works of art in lac, some of which are very ancient. These are usually chow-chow boxes, tea-basins, or other small objects made in wood or metal, and covered over with a crust of lac, coloured with vermilion, which, whilst soft, is moulded into beautiful patterns. So rare and beautiful are some of these works, that even in China they cost almost fabulous prices.

LA'CCADIVES (called by the natives *Lakara-Divh*, i.e., the Lakara Islands), a group of islands in the Arabian Sea, discovered by Vasco de Gama in 1499, lie about 150 miles to the west of the Malabar coast of the peninsula of Hindustan. They extend in N. lat. between 10° and 12°, and in E. long. between 72° and 74°, and are 17 in number. Being of coral formation, they are generally low, with deep water immediately round them, and are therefore all the more dangerous to navigators. Pop. 7000; chief productions cocoa, rice, betel-nuts, sweet potatoes, and cattle of a small breed. The inhabitants, who are called *Moplays*, are of Arabian origin, and in religion follow a sort of Mohammedanism. They pay tribute, said to be about £1000 a year, to the district of Cananore, in the presidency of Madras.

LACE, an ornamental fabric of linen, cotton, or silk thread, made either by the hands, somewhat after the manner of embroidery, or with machinery. The manufacture of lace by hand is an operation of exceeding nicety, and requires both skill and patience of no ordinary kind, and the best productions of this fabric surpass all other applications of textile materials in costliness and beauty.

Whether the ancients really had any knowledge of lace-making, excepting gold-lace, which will be mentioned at the end of this article, is not known, nor is it known with any certainty when this art came into practice in Europe; but there is good reason to suppose that *point-lace*, the oldest variety known, was the work of nuns during the latter half of the 14th and the beginning of the 15th centuries. This point-lace is very characteristic, and is truly an art production. The artistic character of the patterns, and the wonderful patience and labour shewn in carrying them out, places them, as female productions, on a parallel with the decorative works in stone, wood, and metal of the monks. They indicate no tiresome efforts to copy natural objects, but masterly conceptions of graceful forms and tasteful combinations. The actual figures of the pattern were cut out of linen, and over these foundation-pieces, as they may be called, the actual lace-work was wrought by the needle, with thread of marvellous fineness, and with such consummate art, that the material of the foundation is quite undiscoverable under the fairy-like web which has been woven over it. These portions of the fabric were then joined together by connecting threads, each of which, like the broader parts, consists of a foundation, and lace-work covering; the former being a mere thread, often of exceedingly fine yarn; the latter being a sort of loop-work like the modern

between each being sufficiently wide to admit of a shilling passing edgewise between them. Behind these threads, and corresponding to the interspaces, is a row of ingeniously constructed flat bobbins or reels resting in an arrangement called a *comb-bar* or *bolt-bar*. These are so placed, that with the first movement of the machine, each bobbin, which carries its thread with it, passes through two of the parallel and perpendicular threads of the warp, and is lodged in another and similar bolt-bar in front of the warp. But this front bolt bar, besides an advancing and receding motion, has another movement, called *shogging*—from right to left. When it receives a bobbin by its forward motion, it draws back, bringing the bobbin and thread through two of the upright threads; it then *shogs* or moves to one side, and goes forward again, taking the thread through the next two warp-threads, and lodging the bobbin on the back bolt-bar again, one distance beyond its last space; this it recovers by the next movement, and it again passes through the first space, to be again received by the front bolt-bar. By these movements, the bobbin-thread is twisted quite round one upright thread of the warp; another movement then shifts the bobbin, so that it will pass through the next pair of upright threads, and so carry on its work, the warp-threads moving at the same time, unwinding from the lower beam, and being rolled on the upper one. There being twice as many bobbins as there are threads in the warp, each bolt-bar having a set which it exchanges with the other, and all being regulated with great nicety, a width of lace is made in far less time than has been required to write this short description. The various additions to, and variations upon, these operations, which only apply to bobbin-net, for the production of patterns, are so numerous and complicated—each pattern requiring new complications—that it will be useless attempting to describe them; suffice it to say, they all depend upon the variations which can be given to the movements of the flat, disc-like bobbins.

The history of the lace-machine is not very clear; it is said to have been originally invented by a *frame-work* knitter of Nottingham, from studying the lace on his wife's cap; but it has been continually receiving improvements, amongst which those of Heathcote in 1809—the first to work successfully—Morley, in 1811 and 1824, and those of Leaver and Turton, and of Clark and Marl, both in 1811. The manufacture of lace by machinery is chiefly located in Nottingham, whence it is sent to all parts of the world; but we have no means of knowing to what extent, for, with that strange perversity which distinguishes our statistical administration, only *thread-lace* is mentioned in the lists of exports, whilst our vast production of cotton-lace is mixed up with the returns of calico and other fabrics of that material.

Gold-lace and *Silver-lace*, properly speaking, are laces woven, either by the hand or by machinery, from exceedingly fine threads of the metals, or from linen, silk, or cotton threads which are coated with still finer threads of gold or silver; but in this country it is too common to designate as gold or silver lace, not only that which is rightly so-called, but also fringe made of these materials, and also gold and silver embroidery, such as is seen on state robes and trappings, and upon some ecclesiastical dresses, &c. Gold-lace is made in London, but considerable quantities of that used for decorating uniforms and other dresses, &c., in this country, is obtained from Belgium, where it is an important branch of manufacture. France supplies much of the gold and silver thread used, and excels all other countries in its production, in some of the more artistic varieties of gold and silver lace and embroidery. Italy has lately shown great taste and skill. The works

of Luigi Martini of Milan have in this respect attained great celebrity, and are said to produce about £16,000 worth per annum.

LACE-BARK TREE (*Lagetta lintearia*), a tree of the natural order *Thymelæaceæ*, a native of the West Indies. It is a lofty tree, with ovate, entire, smooth leaves, and white flowers. It is remarkable for the tenacity of the fibres of its inner bark, and the readiness with which the inner bark may be separated, after maceration in water, into layers resembling lace. A governor of Jamaica is said to have presented to Charles II. a cravat, frill, and ruffles made of it.

LACE-LEAF. See LATTICE LEAF.

LACÉPÈDE, BERNARD GERMAIN ÉTIENNE DE LAVILLE, COUNT DE, an eminent naturalist and elegant writer, was born of a noble family, 28th December 1766, at Agen. Having early devoted himself to the study of natural history, in which he was greatly encouraged by the friendship of Buffon, he was appointed curator of the Cabinet of Natural History in the Royal Gardens at Paris. This office he held till the Revolution, when he became Professor of Natural History, and also entered upon a political career, in which he rose to be a senator in 1799, a minister of state in 1809, and, after the return of the Bourbons, a peer of France, although he had previously been one of the most zealous adherents of Bonaparte. He died of small-pox at his mansion of Epinay, near St Denis, 6th October 1825. A collective edition of his works was published in 1826. Among them are works on the Natural History of Reptiles, of Fishes, and of the Cetacea, a Work on the Natural History of Man, and one entitled *Les Ages de la Nature*. His work on Fishes (5 vols. 1798—1803) is the greatest of his works, and was long unrivalled in that department of zoology, although it has now been in a great measure superseded. L. was a highly accomplished musician, was the author of a work entitled *La Poétique de la Musique* (2 vols. 1785), and of two romances intended to illustrate social and moral principles. He was an amiable man, extremely kind, delighting in domestic life, and very simple, and almost abstemious, in his habits.

LACERTA and **LACERTIDÆ.** See LIZARD.

LACHAISE, FRANCIS D'AIX DE, a Jesuit, born of a noble family, 25th August 1624, in the castle of Aix, now in the department of Loire, was a provincial of his order, when Louis XIV. selected him for his confessor on the death of Father Ferrier in 1675. His position was one of great difficulty, owing to the different parties of the court, and the strife between Jansenists and Jesuits. In the most important questions of his time, Father L. avoided extreme courses. A zealous Jesuit, and of moderate abilities, he yet sustained among his contemporaries the reputation of a man of mild, simple, honourable character. Madame Maintenon could never forgive him the little zeal with which he opposed the reasons urged against the publication of her marriage with the king; but during the thirty-four years that he filled his office of confessor, he never lost the favour of the king. He was a man of some learning, and fond of antiquarian pursuits. He died 20th January 1709.—Louis XIV. built him a country-house to the west of Paris, the large garden of which was in 1804 converted into a burial-place, and is known as the *Père-la-Chaise*.

LACHES, in English Law, is a word used (from Fr. *lâcher*, to loosen) to denote negligence or undue delay, such as to disentitle a party to a particular remedy, or to relief. In Scotland, the word *more* is often used to denote undue delay.

an extraordinary sensation even on the non-religious world, when once again L. fixed the wonder of the public by relinquishing the career of distinction which was open to him, and entering the novitiate of the Dominican order in 1840. A short time previously, he had published a memoir on the re-establishment of that order in France, which was followed, after his enrolment in the order, by a *Life of its founder, St Dominic*; and in 1841 he appeared once again in the pulpit of Notre-Dame, in the well-known habit of a Dominican friar. From this date, he gave much of his time to preaching in various parts of France. In the first election which succeeded the revolution of 1848, he was chosen one of the representatives of Marseille, and took part in some of the debates in the Assembly; but he resigned in the following May, and withdrew entirely from political life. In 1849, and again in 1850 and 1851, he resumed his courses at Notre-Dame, which, together with earlier discourses, have been collected in three volumes, under the title of *Conferences de Notre-Dame de Paris, 1835-1850*. About this time, however, his health began to decline, and he withdrew in 1854 to the convent of Soreze, where he spent the remainder of his life. In 1858, he wrote a series of *Letters to a Young Friend*, which have been much admired; and in 1860, having been elected to the Academy, he delivered what may be called his last address—the customary inaugural discourse, a *Memoir of his predecessor, M. de Tocqueville*. L. died at Soreze in the following year.

LACQUER is a varnish prepared for coating metal-work (see **LAC**), usually polished brass. The formula usually employed is, for gold colour: alcohol, 2 gallons; powdered turmeric, 1 pound, macerate for a week, and then filter with a covered filter, to prevent waste from evaporation; to this add, of the lightest-coloured shell-lac, 12 ounces; gamboge, 4 ounces; gum-sandarach, 3½ pounds. This is put in a warm place until the whole is dissolved, when 1 quart of common turpentine varnish is added. A red lacquer, prepared by substituting 3 pounds of annotta for the turmeric, and 1 pound of dragon's blood for the gamboge, is extensively used.

LACQUERING, the art of coating metal with varnish. The term has also a wider signification, and is made to apply to the process by which some varieties of goods in wood and papier mâché are also coated with layers of varnish, which are polished, and often inlaid with mother-of-pearl, &c. See **PAPIER MÂCHÉ**. It would appear, from the very fine specimens from Japan in the International Exhibition, that the Japanese excel in the art of producing articles of exquisite thinness and delicacy. The varnish used by the Chinese and Japanese appears to be the same, and is a natural secretion which flows from incisions in the stem of the Varnish-tree (q. v.). Usually, the oriental lacquered work is tastefully ornamented with designs painted in gold, or with inlaid shell-work. The Japanese have carried this art so far as to apply it to their delicately beautiful china, some of which is lacquered and inlaid with mother-of-pearl, forming landscapes and other designs.

LACS D'AMOUR, in Heraldry, a cord of running knots used as an external decoration to surround the arms of widows and unmarried women, the *cordelier*, which differs but slightly from it, being used similarly with the shields of married women.

LACTANTIVS, in several MSS. designated **LUCTUS COLIVS**, or **CÆCILIVS FIRMIANVS** L., an eminent Christian author, who flourished in the

early part of the 4th century. He was of Italian descent, but studied at Sicca, in Africa, under the rhetorician Arnobius, and in 301 A.D. settled as a teacher of rhetoric in Nicomedia. He was invited to Gaul by Constantine the Great (312-318 A.D.), to act as tutor to his son Crispus, and is supposed to have died at Treves about 325 or 330. L.'s principal work is his *Divinarum Institutionum*, libri vii., a production both of a polemical and apologetic character. A supposed tendency to Manicheism in his views, and his Chiliasm, have marred his reputation for pure orthodoxy. He attacks paganism, and defends Christianity. Among his other writings are treatises *De Ira Dei* and *De Mortibus Persecutorum*. Some elegies have also been ascribed to him, but erroneously. His style is wonderful, if we consider the late age at which he wrote, and has deservedly earned for him the title of the *Christian Cicero*. He was, besides, a man of very considerable learning, but as he appears not to have become a Christian till he was advanced in years, his religious opinions are often very crude and singular. L. was a great favourite during the middle ages. The *editio princeps* of this writer is one of the oldest extant specimens of typography. It was printed at Subiaco in 1465.

LACTEALS, **THE**, or **CHYLIFEROUS VESSELS**, are the Lymphatic Vessels (q. v.) of the small intestine. They were discovered in 1622 by Aselli (q. v.), and received their name from conveying the milk-like product of digestion, the Chyle (q. v.), during the digestive process, to the

The Lacteals:

a, a portion of small intestine connected by the membranous structure, termed the mesentery, with the spinal column (the white lines seen in the mesentery are the lacteals, and the white patches are the mesenteric glands); b, the receptaculum forming the commencement of the thoracic duct, which enters the circulating system at the junction of c, the subclavian, and d, the jugular vein, on the right side, e, the vertebral column. The large vessel, with a portion removed, lying in front of the vertebral column, is the ascending or inferior vena cava.

Thoracic Duct (q. v.), by which it is transmitted to the blood. These vessels commence, as has been shewn in the article **DIGESTION**, in the intestinal villi, and passing between the layers of the Mesentery (q. v.), enter the mesenteric glands, and finally unite to form two or three large trunks, which terminate in the thoracic duct.

LACTIC ACID ($C_3H_5O_3.HO$), in its pure state is a transparent, colourless, or slightly yellow

CHAMBERS'S
ENCYCLOPÆDIA

of Klaproth the primitive dialect of the aboriginal people inhabiting the region between Hindustan and Tartary. The religion is Lamaism, a form of Buddhism (q. v.). The government is a despotism controlled by the priesthood. The capital city is Le (q. v.).

LADANUM, or LABDANUM. See **CISTUS**.

LADIES OF THE BEDCHAMBER. See **LADIES OF THE QUEEN'S HOUSEHOLD**.

LADIES OF THE QUEEN'S HOUSEHOLD, THE, consist of the Mistress of the Robes, the Ladies of the Bedchamber, the Bedchamber Women, and the Maids of Honour.

The office of Mistress of the Robes is of considerable antiquity. It is her duty to regulate the rotation and times of attendance of the rest of the Ladies of the Household, who are all subordinate to her. She has the superintendence of all duties connected with the bedchamber—within which the Lord Chamberlain has no authority—and the custody of the robes. On state occasions, she must see that the ceremony of robing the Queen is properly performed. In public ceremonials, she accompanies the Queen in the same carriage, or walks immediately before Her Majesty. The *Ladies of the Bedchamber*, who now number eight, with three extra ladies, and the *Bedchamber Women*, of whom there are eight, besides one resident and two extra, are personal attendants, ministering to the state of Her Majesty. The *Maids of Honour*, of whom there are eight, are immediate attendants on the royal person, and in rotation perform the duty of accompanying the Queen on all occasions. They enjoy by courtesy the title 'Honourable,' when not entitled to it by birth, and are then designated the 'Honourable Miss——' without the Christian name.

LADING, BILL OF. See **BILL OF LADING**.

LADISLAS, VLADISLAS, VLADISLAF, ULADISLAS, different forms of a name frequently occurring in the histories of Poland, Hungary, Bohemia, and Servia.—**VLADISLAS I.** of Poland, surnamed Lokietek (the Short)—one of those princes who appear to be raised up during a period of intestine confusion and disorganisation, for the purpose of shewing how powerful is the influence of one great mind—was ruler of the small province of Cracow, at a time when Poland was subdivided into countless small independencies. V. united them in 1319; and the further to increase the stability of the government, he reduced the privileges of the higher nobles, removed the council of prelates and magnates, replacing it by a popular assembly; he greatly improved the administration of justice, and furthered commerce and industry.—**VLADISLAS II.** and **VLADISLAS III.** See **JACKILONA**.—**VLADISLAS IV.** (1632–1648), while yet a youth, was elected Czar of Russia in 1610, but was prevented by his father, Sigismund, from accepting the crown. He was a wise and politic prince, yet it was under his reign that Sweden, Russia, and Turkey commenced to nibble at the outlying provinces. He strove manfully to remedy the peculiar defects of the Polish constitution, but they were too deeply rooted; and though he sought to end the oppression of the dissidents, and took the part of the Cossacks against those nobles who had deprived them of their rights, so weak was the royal authority, that his support availed them nothing. The Cossacks, maddened by deprivation of their liberties, the imposition of new taxes, and the persecuting zeal of the Roman Catholic clergy, rose in rebellion, annihilated the Polish army, and put themselves under the rule of Russia. At this critical moment, V. died.

LADO'GA (STARALA, or OLD LADOGA), an ancient Russian town, in the government of St Petersburg,

on the left bank of the river Wolkhof. It was the residence (862) of Rurik, the founder of the Russian monarchy, and the walls of a fortress erected by him, and a church of the 11th c., still mark its site. Previously to the accession of Peter I., Old Ladoga was an important strategic point for the defence of Novgorod. Peter I. built the town of Novo, or New Ladoga, near the entrance of the Wolkhof into Lake Ladoga, and now on the site of the old town of Rurik stands the small village of Ouspenskoe.

LADOGA, LAKE, the largest lake of Europe, is situated in the north-west of Russia, between Finland and the governments of Olonetz and Petersburg. It is 120 miles in length, 70 miles in breadth, and 6804 square miles in area. It receives the waters of Lake Onega, Lake Saim, and Lake Ilmen, and its own waters are carried off to the Gulf of Finland by the Neva (q. v.). The depth of Lake L. varies from 12 to 1000 feet, and the navigation is exceedingly dangerous, owing to the shallows, sandbanks, and sunken rocks in which it abounds, and to the gusty winds which are created by its steep and rocky banks. Of the several islands of the lake, the principal are the Valaam and Konevets, with monasteries, which attract numbers of pilgrims. Of the 70 rivers which fall into Lake L., the principal are the Wolkhof, the Sias, and the Svir, each of which is a means of communication between the Neva and the Volga. In order to obviate the difficulty of navigation, canals have been constructed along its south and south-east shores, the principal being the Ladoga Canal (70 feet wide), which unites the mouth of the Wolkhof with the Neva. Other two canals unite the mouths of the Sias and Svir with the Ladoga Canal. This canal-system forms the thoroughfare for a very extensive traffic between the Volga and the Baltic. Communication by water subsists between Lake L. and the White Sea as well as the Caspian.

LADRO'NES, or THIEVES' ISLANDS, a group of about 20 islands, the northernmost Australasian group, in lat. 134°–204° N., and long. 1454°–147° E. They are disposed in a row almost due north and south. Their united area is about 1254 square miles. They were discovered by Magellan (in 1521), who gave them the name which they still bear, from the thievish propensity displayed by the natives. They were afterwards called the *Lazarus Islands*; and the Jesuit missionaries, who settled here in 1667, called them the *Mariana Islands*. They are mountainous, well watered and wooded (among the trees are the bread-fruit, the banana, the cocoa-nut), fruitful in rice, maize, cotton, and indigo. European domestic animals are now very common. At the time when they were discovered, the population was reckoned at 100,000, but the present population is only about 5500. The inhabitants, who are docile, religious, kind, and hospitable, resemble in physiognomy those of the Philippine Islands. The islands are very important to the Spaniards, in a commercial point of view. The largest island is Guajan, 90 miles in circumference; on it is the capital, San Ignacio de Agaña, the seat of the Spanish governor.

LADY, a woman of distinction correlatively to *Lord* (q. v.), used in a more extensive sense in common parlance correlatively to *gentleman*. As a title, it belongs to peeresses, the wives of peers, and of peers by courtesy, the word *Lady* being in all these cases prefixed to the peerage title. The daughters of dukes, marquises, and earls are by courtesy designated by the title *Lady* prefixed to their Christian name and surname; a title not lost by marriage with a commoner, when the lady only substitutes her husband's surname for her own, and retains her

precedence. But a peer's daughter marrying a peer, can no longer be designated by her Christian name with Lady; she must take her husband's rank and title, even should a loss of precedence be the result, as when the daughter of a duke marries an earl, viscount, or baron. Should her husband, however, be merely a courtesy peer, she may retain her designation by Christian name with Lady prefixed, substituting her husband's courtesy title for her surname; this title and precedence being again dropped on her husband's succession to the peerage by his father's death. The daughter-in-law of a duke, marquis, or earl, is generally designated by the title Lady prefixed to the Christian name and surname of her husband, but if she be the daughter of a peer of a higher rank than her father-in-law, she may, if she please, be designated by Lady prefixed to her own Christian name and her husband's surname, and in that case she retains the precedence which she had when unmarried. The wife of a baronet or knight is generally designated by Lady prefixed to her husband's surname; the proper legal designation, however, being Dame, followed by her Christian name and surname.

LADY CHAPEL, a chapel dedicated to the Virgin Mary ('Our Lady'), and usually, but not always, placed eastwards from the altar when attached to cathedrals. Henry VII.'s Chapel at Westminster is the lady chapel of that cathedral.

LADY OF MEROY, *Ouz*, a Spanish order of knighthood, founded in 1218, by James I. of Aragon, in fulfilment of a vow made to the Virgin during his captivity in France. The object for which the order was instituted was the redemption of Christian captives from among the Moors, each knight at his inauguration vowing that, if necessary for their ransom, he would remain himself a captive in their stead. Within the first six years of the existence of the order, no fewer than 400 captives are said to have been ransomed by its means. On the expulsion of the Moors from Spain, the labours of the knights were transferred to Africa. Their badge is a shield party per fess gules and or, in chief a cross pattée argent, in base four pallets gules for Aragon, the shield crowned with a ducal coronet. The order was extended to ladies in 1261.

LADY OF MONTESSA, *Ouz*, an order of knighthood, founded in 1317 by King James II. of Aragon, who, on the abrogation of the order of the Templars, urged Pope Clement V. to allow him to employ all their estates within his territory in founding a new knightly order for the protection of the Christians against the Moors. His request was acceded to by the following pope, John XXII., who granted him for this purpose all the estates of the Templars and of the Knights of St John situated in Valencia. Out of these was founded the new order, which King James named after the town and castle of Montesa, which he assigned as its head-quarters. The order is now conferred merely as a mark of royal favour, though the provisions of its statutes are still nominally observed on new creations. The badge is a red cross edged with gold, the costume a long white woollen mantle, decorated with a cross on the left breast, and tied with very long white cords.

LADYBIRD (*Coccinella*), a genus of coleopterous insects of the section *Trisera*, containing a great number of species very similar to each other. They are very pretty little beetles, well known to every one, generally of a brilliant red or yellow colour, with black, red, white, or yellow spots, the number and distribution of which is one of the characteristic marks of the different species. The form is nearly hemispherical, the under-surface being very flat, the

thorax and head small; the antennae are short, and terminate in a triangular club; the legs are short. When handled, these insects emit from their joints a yellowish fluid, having a disagreeable smell. They and their larvae feed chiefly on aphides, in devouring which they are very useful to hop-growers and other agriculturists. They deposit their eggs under the leaves of plants, on which the larvae are to find their food, and the larvae run about in pursuit of aphides. Ladybirds are sometimes to

be seen in immense numbers, which, from ignorance of their usefulness, have sometimes been regarded with a kind of superstitious dread. Several species are abundant in Britain, and the largest of these (*C. septem-punctata*) is found over all Europe, and in parts of Asia and Africa. The name *L.* is perhaps a corruption of *Ladybug* (Lady, i.e., the Virgin Mary). The German name is *Marienkäfer*.

LADY-DAY, one of the regular quarter-days in England and Ireland, on which rent is generally made payable. It is the 25th of March in each year.

LADY'S FRIEND, a name given to an officer of the House of Commons, who used to take care that a provision was inserted in favour of a wife when the husband applied for an act of parliament to divorce her. The practice is now superseded by the different practice in an ordinary suit in the divorce court.

LADY'S GOWN, a present formerly made in Scotland by a purchaser of an estate to a wife on her renouncing her life-rent over her husband's lands.

LADY'S MANTLE (*Achillea*), a genus of herbaceous plants, chiefly natives of temperate and cold climates, of the natural order *Rosaceae*, sub-order *Sanguisorbeae*; having small and numerous flowers, an 8-cleft calyx, no corolla, and the fruit surrounded by the persistent calyx. The name *L. M.* signifying *Mantle of Our Lady*—i.e., of the Virgin Mary, is derived from the form of the leaves.—The Common *L. M.* (*A. vulgaris*) is abundant on banks and in pastures throughout Britain. Its root-leaves are large, pinnate, many-lobed, and serrated; its flowers in corymbose terminal clusters are usually of a yellowish-green colour.—Still more beautiful is the ALPINE *L. M.* (*A. alpina*), which grows on mountains in Scotland, and has digitate serrated leaves, white and satiny beneath.—A common British plant of very humble growth and unpretending appearance is the FIELD *L. M.*, or **PAMELY PIKE** (*A.*—or *Aphanes—arvensis*), found in pastures, an astringent and diuretic, said to be sometimes useful in cases of stone in the bladder, by producing a large secretion of lithic acid.

LADY'S SLIPPER (*Cypripedium*), a genus of plants of the natural order *Orchidaceae*, of which one species, *C. Calceolus*, is a native of Britain, being found in a few places in the north of England, and is reckoned one of the most beautiful of the British Orchids. The genus is remarkable for the large inflated lip of the corolla. Several very beautiful species are natives of the colder parts of North America.

LAWNMO, RENÉ THEOPHILE HYACINTHE, a distinguished physician, was born at Quimper, in

Lower Brittany, in 1781, and died there in 1826. He studied medicine in Paris, where he attended the practice of Corvisart, to whom the medical profession is mainly indebted for the introduction of percussion in the investigation of diseases of the chest, although the original discovery is due to Avenbrugger. In 1814, he took the degree of Doctor of Medicine, and in the same year, he became the chief editor of the *Journal de Médecine*. In 1816, he was appointed chief physician to the Hôpital Necker, and it was there that he soon after made the discovery of mediate auscultation, or, in other words, of the use of the Stethoscope (q. v.). In 1819, he published his *Traité de l'Auscultation Médiate*, which has undoubtedly produced a greater effect, in so far as the advance of diagnosis is concerned, than any other single book. His treatise had not long appeared, when indications of consumption were discovered in his own chest by means of the art of his own creation, and after a few years of delicate health, during which he continued to practise in Paris, he retired to die in his native province.

LÆTARÉ SUNDAY, called also MID-LENT, is the fourth Sunday of Lent. It is so named from the first word of the Introit of the mass, which is from Isaiah lxvi. 10. From this name the characteristic of the services of the day is joyousness, and the music of the organ, which throughout the rest of Lent is suspended, is on this day resumed. Lætare Sunday is also the day selected by the pope for the blessing of the GOLDEN ROSE (q. v.).

LA FARI'NA, an Italian author and politician, born at Messina in 1815. In the university of Catania, the degree of Doctor of Laws was conferred on him at the age of 19; and in 1837, having taken part in an ineffectual revolutionary movement in Sicily, he sought safety in expatriation. In 1839, he returned to Sicily, was received as a lawyer, and started several political journals, which were all successively suppressed. This led him to remove to Florence, where he published several works, more remarkable for their contents than for the graces of their language. In the rising of 1848, La F. took a prominent part in the movement of Tuscany, where he edited the first democratic and anti-papal journal, the *Alba*. He soon returned to Sicily, and was elected member of the council of war, and member of parliament; and on the deposition of the king by the Sicilians, he was despatched by the provisional government on a mission to Rome, Tuscany, and Turin. On his return to Palermo, he discharged the combined duties of Minister of Public Instruction, of Public Works, and of the Interior. After the capture of Messina by the royal troops, La F. accepted from the king's government the post of Minister of War, a step which incurred the severe censure of the party of liberty, but which only led to his renewed banishment from Sicily. In the war of the south, by which the heroic Garibaldi liberated the kingdom of Naples, La F. reappeared in Sicily; but his unfortunate differences with Garibaldi led to his ultimate expulsion from the island, by order of the dictator. Some of his principal works are—*Souvenirs of Rome and Tuscany*; *Italy* (1 vol.); *Switzerland* (2 vols.); *China* (4 vols.); *History of the Revolution of Sicily in 1848 and 1849* (2 vols.).

LAFAYETTE, MARIE MADELEINE POCHE DE LAVERGNE, COMTESSE DE, born 1633, died 1693, the authoress of a number of novels, excelled by no works of that age in the development of character and true delineation of human nature. Her father, Aymar de Lavergne, was governor of Havre. She received an excellent education, and in 1655

married the Count de Lafayette, after which her house became a resort of the most distinguished literary men of her age, at the same time that it was frequented by the persons of highest rank and fashion in Paris. Her novels, *Zaïde* and *La Princesse de Clèves*, have been frequently reprinted.

LAFAYETTE, MARIE JEAN PAUL ROCH YVES GILBERT MOTIER, MARQUIS DE, descended from an ancient family of Auvergne, was born 6th September 1757, in the castle of Chavagnac, now in the department of Upper Loire. He became a soldier at an early age, and in 1777 went to America, to take part with the colonists in their war of independence. The friendship of Washington exercised a great influence over the development of his mind and the formation of his opinions. The declaration of war between France and Britain gave him an opportunity of aiding the new republic effectually, by returning to France, where he was received with honour by the court, and with enthusiasm by the people. He again repaired to America in 1780, and was intrusted by Congress with the defence of Virginia, where he rendered important services. On a third visit to North America in 1784, after the conclusion of peace, he was received in such a manner that his tour was a continual triumph.

L. had imbibed liberal principles, and now eagerly sought to promote a thorough reform in his native country. He was called to the Assembly of Notables in 1787, and was one of those who most earnestly urged the Assembly of the States. He took part also in the movements which converted the Assembly of the States into the National Assembly in 1789. He took a very active part in the proceedings of the Assembly, and being appointed to the chief command of the armed citizens, laid the foundation of the National Guard, and gave it the tricolor cockade. In these first periods of the Revolution, it seemed as if L. had the destinies of France in his hands. But he found himself unable to control the excitement which sprung up. The extreme republicans soon came to dislike him, because he advocated a constitutional kingdom; and the court-party, especially the queen, did the same—in spite of the services he rendered them—because of his zeal for the new order of things. Along with Bailly, he founded the club of the Feuillants. After the adoption of the constitution of 1790, he retired to his estate of Lagrange, till he received the command of the army of Ardenne, with which he won the first victories at Philippeville, Maubeuge, and Florennes. Nevertheless, the calumnies of the Jacobins rendered him exceedingly unpopular, and he was accused of treason, but acquitted. After several vain efforts to maintain the cause of rational liberty, he left Paris for Flanders, but was taken prisoner by the Austrians, and conveyed to Olmütz, where he remained for about five years, till Bonaparte obtained his liberation in 1797; but he took no part in public affairs during the ascendancy of Bonaparte. He sat in the Chamber of Deputies for the department of Sarthe from 1818 to 1824, and was one of the extreme Left. From 1825 to 1830, he was again a leader of the opposition in the Chamber of Deputies. In 1830, he took an active part in the revolution, and commanded the National Guards. He died 20th May 1834.

LAFAYETTE, a city of Indiana, United States of America, on the east bank, and at the head of navigation of the Wabash River, 63 miles north-west of Indianapolis, on the line of the Wabash and Erie Canal, and at the intersection of four railways. It is a flourishing city, in the midst of a rich prairie-country. Laid out in 1825, it has 15 churches, 2 daily, and 3 weekly newspapers, with

numerous banks, hotels, and manufactories. Pop. in 1860, 9428.

LAFFITTE, JACQUES, a French banker and statesman, born of humble parentage at Bayonne, 24th October 1767, was early employed as a clerk by the rich banker Perregaux in Paris, and succeeded him in business in 1809. He soon rose to great wealth and a European reputation. He was made President of the Chamber of Commerce, and in 1814 governor of the Bank of France. On the return of Napoleon from Elba, Louis XVIII. deposited a large sum in L.'s hands; and after the battle of Waterloo, Napoleon intrusted 5,000,000 francs to him, which he kept safe, although the government made some attempts to lay hold of it. After the second restoration, he became one of the opposition in the Chamber of Deputies, and enjoyed the highest popularity in Paris. When the revolution broke out in 1830, he wrote to the Duke of Orleans, saying, 'You have to make your choice between a crown and a passport.' He freely supplied the money requisite on that occasion. He became one of the first ministry of the new king, and in November 1830 was intrusted with the formation of a cabinet, the conservative character of which caused the loss of his popularity. Meanwhile his banking affairs fell into confusion, and he was obliged to sell all his property to pay his debts. A national subscription preserved him his hôtel in Paris; and being again elected to the Chamber as a deputy for Paris, he became a leader of the opposition. From the ruins of his fortune he founded a new Discount Bank. As the government receded more from the principles of the revolution of 1830, L. became more active in opposition. In 1843, to the great displeasure of the court, he was elected president of the Chamber of Deputies. He died 26th May 1844.

LAFONTAINE, JEAN DE, a French poet, distinguished above all his countrymen as a fabulist, was the son of a Maître des Eaux et Forêts, and was born July 8, 1621, at Château-Thierry, in Champagne. In his early youth, he learned almost nothing, and at the age of 20, he was sent by his father to the Oratory at Rheims, in a state of extreme ignorance. Here, however, he began to exhibit a decided taste for the classics and for poetry. Though selfish and vicious to the last degree, he possessed withal a certain child-like *bonhomie*; it was not grace, or vivacity, or wit, but a certain soft and pleasant amiability of manner, so that he never wanted friends. He successively found protectors in the Duchess de Bouillon, who drew him to Paris; in Madame de Sablière, and in M. and Madame Hervart. He enjoyed the friendship of Molière, Boileau, Racine, and other contemporary celebrities; and even the saintly Fenelon lamented his death in extravagant strains. In 1693, after a dangerous illness, he carried into execution what a French critic characteristically terms his *projet de conversion*, and spent the brief remainder of his life in a kind of artificial penitence, common enough among licentious men and women in those sensual days. He died at Paris, April 13, 1695. His best, which, however, are also his most immoral productions, are *Contes et Nouvelles en Vers* (Paris, 1665; 2d part, 1666; 3d part, 1671), and *Fables Choies mises en Vers* (also in three parts, of which the first appeared in 1668, and the third in 1693). The editions of the *Fables* have been innumerable. The best edition of L.'s collected works is that of Walckenaër (18 vols. Paris, 1819—1820; improved edition, in 6 vols. 1822—1823).

LAGERSTROMIA, a genus of plants of the

natural order *Lythraceæ*, the type of a sub-order *Lagerstromieæ*, which is distinguished by winged seeds, and in which are to be found some of the noblest trees of tropical forests, whereas the true *Lythreæ* are generally herbaceous. *Lagerstromia Regiæ* is the JAROOI of India—a magnificent tree, with red wood, which, although soft, is durable under water, and is therefore much used for boat-building.

LA'GOMYS, a genus of rodent quadrupeds, of the family *Leporidae*, much resembling hares or rabbits, but with limbs of more equal length, more perfect clavicles, longer claws, longer head, shorter ears, and no tail. They are interesting from their peculiar instincts, storing up herbage for winter use in heaps or stacks. The ALPINE L., or PIKA of Siberia (*L. alpinus*), the largest of the genus, is scarcely larger than a guinea-pig, yet its stacks are sometimes four or five feet high, by eight feet in diameter, and often afford adventurous sable-hunters the food necessary for their horses. The little animals live in burrows, from the inhabited part of which galleries lead to the stacks. The herbage of which they are composed is of the choicest kind, and dried so as to retain much of its juices, and form the very best of hay.

LAGOON (Lat. *lacuna*, a hollow or pool) is a species of lake formed by the overflowing either of the sea or of rivers, or by the infiltration of water from these; and hence lagoons are sometimes divided into fluvial and marine. They are found only in low-lying lands, such as the coasts of Holland, Italy, the Baltic, and the east coast of South America; are generally shallow, and do not always present the same aspect. In some cases, they are completely dried up in summer; in others, after being once formed, they preserve throughout the whole year the character of stagnant marshy pools; and in others, again, the sea, which re-unites them to itself in winter, is separated from them in summer by a bar of sand or shingle.

LA'GOS, a city and seaport of Portugal, in the province of Algarve, on a wide bay, 23 miles east-north-east from the extremity of Cape St Vincent. The harbour affords protection from north and west winds only, and accommodates only small vessels. A productive tunny-fishery is carried on in the vicinity. Pop. 7800. In the bay of L., Admiral Boscawen obtained a signal victory over the French Toulon fleet, August 18, 1759.

LAGRANGE, JOSEPH LOUIS, COMTE, one of the greatest of mathematicians, was born at Turin in 1736. He was of French extraction, and was the grandson of Descartes. When still a youth, he solved the isoperimetrical problem of Euler, and when scarcely 19 years of age, was appointed Professor of Mathematics in the Artillery School in Turin. Frederick the Great appointed him to be Euler's successor, as director of the Academy at Berlin, in 1759. After Frederick's death, Naples, Sardinia, Tuscany, and France strove for the honour of offering L. a better position. He accepted the offer of France, and took up his quarters in the Louvre in 1787, obtaining a pension of 6000 francs (£238). In 1791, he was chosen a foreign member of the Royal Society of London, and the same year the National Assembly confirmed to him his pension, and he was appointed one of the directors of the Mint. He was in great danger during the Reign of Terror, but escaped, and was afterwards professor in the Normal and Polytechnic Schools. Napoleon made him a member of the Senate, bestowed on him the Grand Cross of the Legion of Honour, the title of Count,

and many other favours. He died 10th April 1813, and was interred in the Pantheon. His principal works are: *Memoirs 'on the Motion of Fluids'* and *'the Propagation of Sound'*; another memoir refuted D'Alembert's views regarding the theory of the earth's formation. When only 24 years of age, he published his *New Method*, subsequently known as the *Calculus of Variations*, thus adding a new and powerful weapon to the philosophical armoury. In 1764, his memoir on the 'Libration of the Moon' carried off the first prize at the Academy. It was in this treatise that he shewed the extent and fruitfulness of the principle of 'virtual velocities' which he afterwards so successfully applied to mechanics. Next appeared his works on the solution of 'numerical' and 'algebraic' equations; and in 1787, his *Mécanique Analytique*, a work in which mechanics is reduced to a mere question of calculation. His last important works were, *Calcul des Fonctions Analytiques*, *Traité des Fonctions*, and *Résolution des Equations Numériques*. L. made many other important investigations in pure and mixed mathematics, and particularly in astronomy—the chief subjects of which are, the problem of Three Bodies, the Long Inequality of Jupiter and Saturn, the moon's Secular Inequality, attraction of ellipsoids, perturbations of Jupiter's satellites, diminution of the ecliptic, variation of the elements of the planetary orbits, &c.

LAGRIMOSO, an Italian term used in Music, meaning weeping, or mournfully; similar to *lamentoso*, which expresses the same, but in a higher degree. The delivery should be heart-stirring, but at the same time free from all mannerisms and embellishments.

LA GUAYRA. See GUAYRA, LA.

LA GUÉRONNIÈRE, LOUIS ÉTIENNE ARTHUR, VICOMTE DE, a conspicuous French politician of the present day, was born in 1816, of a noble family of Poitiers. He first attracted notice by the articles which he contributed to the *Avenir National* of Limoges, about 1835. Subsequently, he made the acquaintance of Lamartine, whom for many years he regarded both as his political and literary master. Ultimately, he came to a rupture with Lamartine, and became an ardent Bonapartist, and after the *coup d'état* (2d December 1851), the apologist of that audacious deed. In 1853, he entered the Council of State. La G. has retained his connection with the press, and, at least until recently, stood so well in the good graces of the French emperor, that his articles and pamphlets have been considered to possess a semi-official value. The paper he now conducts, *La France*, has attained a high degree of importance in the sphere of political journalism. La G.'s most noted publications of late years have been: *L'Empereur Napoléon III. et l'Angleterre* (1858), *L'Empereur Napoléon III. et l'Italie* (1859), and *Le Pape et le Congrès* (1859).

LAHIJAN, an important trading-town of Persia, in the province of Ghilan, close to the southern shore of the Caspian Sea, thirty miles east-south-east of Reshd. Pop. 7000.

LAHN, an important affluent of the Rhine (q. v.).

LAHO'RE, the chief city of the Punjab, stands on the left bank of the Ravi, the middle of the five rivers which give name to the country; lat. 31° 36' N., long. 74° 21' E. It is surrounded by a brick wall, formerly twenty-five feet high, and by fortifications seven miles in circuit. In the north-west corner of the city stand the citadel, the great magazine, and military workshops. The streets are narrow and gloomy, the bazars well furnished, but the houses in general insignificant. Within

the circuit, wells are abundant; the ground is well cultivated, adorned with magnificent gardens, and strewn with numerous ruins of a bygone splendour and prosperity. The present town, which has a population of about 100,000, is said to have possessed under the Moguls 1,000,000 inhabitants. In the 12th c., it was the capital of the dynasty of the Ghaznevides, and subsequently a favourite residence of the successors of Baber. In 1799, Runjeet Singh, the Sikh prince, became ruler of Lahore; but as he chose for his head-quarters, Amritsar, a city about forty miles to the east, L. became much neglected. Since 1849, the epoch of the British conquest of the Punjab, L. has advanced in commerce and wealth. More especially, however, has the change of masters been beneficial to education. A seminary not only for imparting Hindu and Mohammedan literature, but also for communicating, through vernacular languages, European knowledge, has been successfully established. The institution, though it does receive a grant in aid from the supreme government, is yet mainly supported by the rulers and populations of native principalities. Even in 1849, the pupils numbered 541.

LAHR, a manufacturing town of Baden, situated on the Shutter, an affluent of the Rhine, 53 miles south-south-west of Carlsruhe. It stands in a rich and beautiful district, and carries on considerable manufactures of linen and woollen cloth, silk ribbons, leather, and tobacco. Pop. 7000.

LAI'BACH, or **LAYBACH**, a town of Austria, capital of the crownland of Carniola, is situated in an extensive plain on a river of the same name, fifty miles north-east of Trieste. It contains a lyceum, gymnasium, and other educational institutions, and carries on an extensive transit-trade with Trieste, Fiume, Gritz, &c. Its manufactures of cotton employ 400 hands, and upwards of 200 workmen are employed in the sugar-works. To the south-west of the town is the Laibach Morass, which formerly was frequently covered by the swollen waters of the river. It is upwards of eighty square miles in extent. Within the last thirty years, the half of it has been brought under cultivation, the remainder affords an inexhaustible supply of turf. Pop. 20,100.

This town is famous for the congress of monarchs which met here in 1821. The purpose of this congress was to secure the peace of Italy against Carbonarism, to arrest the then increasing progress of revolution, and to restore in Naples and Sicily the former condition of affairs. The result of it was the passing of a resolution establishing among European nations the right of armed intervention in the affairs of any neighbouring state which may be troubled with factions. In the resolutions of this congress the British minister refused to take part.

LA'IS, the name of one, or, more probably, two Greek courtesans, celebrated for extraordinary beauty. The elder is believed to have been born at Corinth, and flourished during the Peloponnesian War. She was reckoned to possess the most graceful figure of any woman of her time in Greece, but she was capricious, greedy of money, and in her old age became a tippler.—The younger appears to have been born in Sicily, but came to Corinth when still a child. She sat as a model to the painter Apelles, who is said to have recommended her to adopt the profession of a prostitute, in which she obtained a 'bad eminence.' She was stoned to death by some Thesalian women whom she had made jealous. Both of these women had temples erected to their memory.

LA'ITY (from the Gr. *laos*, the common people), the name given in the Roman Catholic Church to

all persons who do not belong to the Clergy (q. v.). The name appears to have originated as early as the 2d c., when the idea grew up that the priesthood formed an intermediate class between Christ and the Christian community. The influence which the laity had at first exercised in the government of the church gradually declined as the power of the hierarchy increased, and although, as late as the end of the 3d c., cases occur in which learned laymen taught publicly with the approval of bishops, still this liberty was ever more and more narrowed, until finally, in 502, a synod, held at Rome under the bishop, Symmachus, forbade laymen to interfere in any way in the affairs of the church. The Protestant Church, in general, maintains on scriptural grounds the common and equal priesthood of all Christians; still, as marking a visible distinction of office, the words continue in very general use, the depth of the distinction implied varying with the 'church' views of those employing them. Some very strict Protestants are careful to say minister and people, instead of clergy and laity.

LAKE (Lat. *lacus*) is a portion of water surrounded by land. There are (1) some lakes which neither receive nor emit streams; (2) some, fed by springs, emit, but do not receive streams; (3) others, as the Caspian and Aral Seas, receive rivers, but have no visible outlet; but (4) by far the greater number both receive and emit streams. Almost the whole of the lakes coming under the third class are salt or brackish; Lake Tchad, in Central Africa, forming one of the most prominent exceptions.

LAKE OF THE THOUSAND ISLANDS, an expansion of the St Lawrence (q. v.), extends about 40 miles below the north-east end of Lake Ontario. It is well worthy of its name, being said to contain 1700 islets, the largest measuring 10 miles by 6. It separates Upper Canada from the state of New York.

LAKE OF THE WOODS, a body of water famous in the history of the international boundary between the United States and the Hudson's Bay Company's territories, takes its name from the fact of its being studded with wooded islands, and lies 190 miles west-north-west of Lake Superior. At its south-east end, it receives the Rainy River from the Rainy Lake; and at its north-west extremity, it sends forth the Winnipeg on its course to Hudson's Bay. According to the treaty which closed the War of Independence, it was divided by a central line between England and her old colonies. It measures about 300 miles round; and its remotest point is in lat. 49° N., and long. 95° W.

LAKE SCHOOL, the name with which the *Edinburgh Review* dubbed certain poets (Wordsworth, Coleridge, and Southey) who, towards the close of last c., took up their residence in the Lake district of Cumberland and Westmoreland, and who—though widely different from each other in almost every other respect—professed to seek the sources of poetical inspiration in the simplicity of nature, rather than in the works of their predecessors and the fashion of the times. The epithet, however, is not a happy one, and does not help us to a better knowledge of the men.

LAKES, in point of law, belong to the owner of the land which surrounds them; by which is meant not only the water and the use of it, but the soil under the water. Where the land surrounding the lake belongs to different owners, each has *prima facie* the right to use the lake for ordinary purposes, including fishing or boating; but it depends on how the properties were acquired, whether and how far this general rule applies to any particular case.

LAKES, colours prepared by combining animal and vegetable colouring matters with alumina, which has a remarkable property of uniting with and separating these colours from their solutions. Thus, if we take the coloured solution of cochineal, and add to it a solution of alum, the alumina in the alum immediately combines with the colouring matter, and the result is a precipitate which is carmine or Florentine Lake.

Red lake is made in a similar manner from Brazil wood, a little solution of tin being added to heighten the colour, and potash being used to accelerate the precipitation. Lakes of several shades of red and purple are also made from madder-roots, the quantity of potash used determining the proper colour. Two or three yellow lakes are used, the manufacture of which is very similar; they are prepared from yellow berries or from arnott. Almost every known animal or vegetable colour may be converted into a lake, but those mentioned are the only ones found practically useful. They are chiefly employed by calico-printers and paper-stainers.

LAKSHMI, in Hindu Mythology, the name of the consort of the god Vishn'u (q. v.), and considered also to be his female or creative energy. According to the mystical doctrine of the worshippers of Vishn'u, this god produced the three goddesses, Brâhmi, Lakshmi, and Chan'dika, the first representing his creating, the second, his preserving, and the third, his destroying energy. This view, however, founded on the superiority of Vishn'u over the two other gods of the Hindu triad—Brâhmi, or Saraswati, being generally looked upon as the energy of Brahmâ, and Chan'dika, another name of Durgâ, as the energy of Sîva—is later than the myth, relating to L. of the epic period; for, according to the latter, L. is the goddess of Fortune and of Beauty, and arose from the Ocean of Milk when it was churned by the gods to procure the beverage of Immortality, and it was only after this wonderful occurrence that she became the wife of Vishn'u. When she emerged from the agitated milk-sea, one text of the Râmâyana relates, 'she was reposing on a lotus-flower, endowed with transcendent beauty, in the first bloom of youth, her body covered with all kinds of ornaments, and marked with every auspicious sign. . . . Thus originated, and adored by the world, the goddess, who is also called *Padmâ* and *Srî*, betook herself to the bosom of Hari—i. e., Vishn'u.' A curious festival is celebrated in honour of this divinity on the fifth lunar day of the light half of the month Mâgha (February), when she is identified with Saraswati, the consort of Brahmâ, and the goddess of learning. In his treatise on festivals, a great modern authority, Raghunandana, mentions, on the faith of a work called *Samvatsara-sandâpa*, that L. is to be worshipped in the forenoon of that day with flowers, perfumes, rice, and water; that due honour is to be paid to inkstand and writing-reed, and no writing to be done. Wilson, in his essay on the *Religious Festivals of the Hindus* (works, vol. ii. p. 188, ff.), adds that, on the morning of the 2d February, 'the whole of the pens and inkstands, and the books, if not too numerous and bulky, are collected, the pens or reeds cleaned, the inkstands scoured, and the books, wrapped up in new cloth, are arranged upon a platform, or a sheet, and strewn over with flowers and blades of young barley, and that no flowers except white are to be offered. After performing the necessary rites . . . all the members of the family assemble and make their prostrations; the books, the pens, and ink having an entire holiday; and, should any emergency require a written communication on the day dedicated to the divinity of scholarship, it is done with

chalk or charcoal upon a black or white board.' In different parts of India, this festival is celebrated at different seasons, according to the double aspect under which L. is viewed by her worshippers. The festival in the month Māgha seems originally to have been a vernal feast, marking the commencement of the season of spring.

LANANDE, JOSEPH JÉRÔME LEFRANÇOIS DE, an eminent French astronomer, was born at Bourg, 11th July 1732. He devoted himself with such success to mathematics and astronomy, that the French Academy sent him to Berlin in 1751, to determine the moon's parallax, at the same time that Lacaille was sent to the Cape of Good Hope. In 1752, he returned, and was appointed one of the astronomers-royal; and in 1761, succeeded Lemonnier in the professorship of astronomy in the Collège de France. His lectures had a rare attractiveness, and he published several astronomical works of a popular kind, as well as works of profound science. He finally filled the office of Director of the Paris Observatory, and died 4th April 1804. His character was marked by extreme vanity; but no one has ever equalled him as a lecturer on astronomy, and few have contributed more to the general progress of astronomical science. His principal work is his *Traité d'Astronomie* (2 vols. Paris, 1764—a new and augmented edition in 4 vols. Paris, 1771—1781). He also published minor works on astronomy, navigation, &c., and an account of his travels in Italy during 1765 and 1766 (9 vols. Paris, 1786).

LALITA-VISTARA is the name of one of the most celebrated works of Buddhistic literature. It contains a narrative of the life and doctrine of the Buddha S'akyamuni (see BUDDHA), and is considered by the Buddhists as one of their nine chief works, treating of Dharma, or religious law. It is one of the developed Sūtras of the Mahāyāna system. An edition of the Sanscrit text, and an English translation of this work by Bābu Rājendraśāl Mitra, is publishing under the auspices of the Asiatic Society of Bengal. A French translation from the Tibetan has been made by Ph. Ed. Foucaux. In Chinese, there are two translations of it. See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

LA'MA, or **LLAMA** (*Auchenia lama*), a most useful South American quadruped of the family *Camelidae*. It is doubtful whether it ought to be regarded as a distinct species, or as a mere domesticated variety of the *Huanaca* (q. v.). It was in general use as a beast of burden on the Peruvian Andes at the time of the Spanish conquest, and was the only beast of burden used by the natives of America before the horse and ass were introduced by Europeans. It is still much used in this capacity on the Andes, the peculiar conformation of its feet (see *AUCHENIA*) enabling it to walk securely on slopes too rough and steep for any other animal. The working of many of the silver mines of the Andes could scarcely be carried on but for the assistance of lamas. The burden carried by the L. should not exceed 125 pounds. When too heavily loaded, the animal lies down, and refuses to move, nor will either coaxing or severity overcome its resolution. It is generally very patient and docile. Its rate of travelling is about 12 or 15 miles a day. The L. is about three feet in height at the shoulder, has a longish neck, and carries its head elevated. The females are smaller and less strong than the males, which alone are used for carrying burdens. The colour is very various, generally

brown, with shades of yellow or black, frequently speckled, rarely quite white or black. The flesh is spongy, coarse, and not of a very agreeable flavour. The hair or wool is inferior to that of the alpaca, but is used for similar purposes; that of the female is finer than that of the male. The L. has been introduced with the alpaca into Australia; but it is only for steep mountain regions that it seems to be adapted.

LA'MAISM (from the Tibetan *bLama*,* spiritual teacher or lord) is the name of the religion prevailing in Tibet and Mongolia. It is Buddhism (q. v.) corrupted by S'ivaism (q. v.), and by Shamaism (q. v.), or spirit-worship. As ancient Buddhism knows of no worship of God, but merely of an adoration of saints, the latter is also the main feature of Lamaism. The essence of all that is sacred is comprised by this religion under the name of dKon mChhog gSsum (pronounced *Konchogsum*), which consists of the 'three most precious jewels'—viz., 'the Buddha-jewel,' the 'doctrine-jewel,' and 'the priesthood-jewel.' A similar triad is implied by the three Buddhistic formulae: 'I take my refuge in Buddha; I take my refuge in the law (or doctrine); I take my refuge in the congregation (of the priests),' but it did not obtain the same dogmatic importance in Buddhism as in Lamaism, where it is looked upon as a kind of trinity, representing an essential unity. The first person of this trinity is the Buddha; but he is not the creator, or the origin of the universe; as in Buddhism, he is merely the founder of the doctrine, the highest saint, though endowed with all the qualities of supreme wisdom, power, virtue, and beauty, which raise him beyond the pale of ordinary existence. The second jewel, or the doctrine, is the law or religion—that which is, as it were, the incarnation of the Buddha, his actual existence after he had disappeared in the Nirvāna. The third jewel, or the priesthood, is the congregation of the saints, comprising the whole clergy, the incarnate as well as the non-incarnate representatives of the various Buddhistic saints. The latter comprise the five Dhyāni-Buddhas, or the Buddhas of contemplation, and, besides, all those myriads of Bodhisattvas, Pratyeka-Buddhas, and pious men, who became canonised after their death. It is obvious that among their number a portion only can enjoy practical worship; but the clergy, as the visible representative of these saints, claim and receive due homage at all the religious ceremonies. Inferior in rank to these saints are the gods and spirits, the former chiefly taken from the Pantheon of the S'ivaita. The highest position amongst these is occupied by the four spirit-kings—viz., *Indra* (q. v.), the god of the firmament; *Yama*, the god of death and the infernal regions; *Yamāntaka*, or *S'iva*, as revenger in his most formidable shape; and *Vaiśravaṇa*, or the god of wealth. The worship of these saints and gods consists chiefly in the reciting of prayers, and sacred texts, and the intonation of hymns, accompanied with a kind of music, which is a chaos of the most unharmonious and deafening sounds of horns, trumpets, and drums of various descriptions. During this worship, which takes place three times a day, the clergy, summoned by the tolling of a little bell, are seated in two or more rows, according to their rank; and on special holidays, the temples and altars are decorated with symbolical figures, while offerings of tea, flour, milk, butter, and others of a similar nature, are made by the worshippers; animal sacrifices or offerings entailing injury to life being forbidden, as in the Buddhistic faith. Lamaism knows especially

* The small letters prefixed to the initials of the Tibetan words in this article are not pronounced.

three great festivals. The *Log gSaar*, or the festival of the new year, in February, marks the commencement of the season of spring, or the victory of light and warmth over darkness and cold. The Lamaists, like the Buddhists, celebrate it in commemoration of the victory obtained by the Buddha S'akyamuni, over the six heretic teachers. It lasts fifteen days, and consists of a series of feasts, dances, illuminations, and other manifestations of joy; it is, in short, the Tibetan carnival. The second festival, probably the oldest festival of the Buddhist Church, is held in commemoration of the conception or incarnation of the Buddha, and marks the commencement of summer. The third is the *water-feast*, in August and September, marking the commencement of autumn. Baptism and confirmation are the two principal sacraments of Lamaism. The former is administered on the third or tenth day after birth; the latter, generally when the child can walk and speak. The marriage ceremony is to Tibetans not a religious, but a civil act; nevertheless, the Lamas know how to turn it to the best advantage, as it is from them that the bridegroom and bride have to learn the auspicious day when it should be performed; nor do they fail to complete the act with prayers and rites, which must be responded to with handsome presents. A similar observation applies to the funeral ceremonies of the Tibetans. Properly speaking, there are none requiring the assistance of the clergy, for Lamaism does not allow the interment of the dead. Persons distinguished by rank, learning, or piety, are burned after their death; but the general mode of disposing of dead bodies in Tibet, as in Mongolia, is that of exposing them in the open air, to be devoured by birds and beasts of prey; yet it is the Lama who must be present at the moment of death, in order to superintend the proper separation of body and soul, to calm the departed spirit, and to enable him to be reborn in a happy existence. He must determine the auspicious day and hour when, and the auspicious place where, the corpse is to be exposed. The most lucrative part of his business, however, is the masses which he has to perform, until the soul is released from Yama, the infernal judge, and ready to re-enter into its new existence; the doctrine of metempsychosis being the same in this religion as in Buddhism.

One of the most interesting features of Lamaism is the organisation of its hierarchy. Its summit is occupied by two Lama popes, the one called *Dalai-lama*, i. e., Ocean-priest, or priest as wide as the ocean—he resides at Potala, near H'lassa—the other bearing the titles of *Tesho-lama*, *Bogdo-lama*, &c., and officially called *Pan-chhen Rin po chhe*, literally, 'the right reverend great teacher-jewel' (i. e., precious teacher); he resides in the convent at bKra Shiss Lhun po, near gShiss Ka rTse. In theory, both popes have the same rank and authority, in spiritual as well as in temporal matters; but as the Dalai-lama possesses a much larger territory than the other, he is in reality much more powerful. Next in rank are the *Khutuktus*, who may be compared to the Roman Catholic cardinals and archbishops. The third degree is that of the *Khubilghans* or *Hobilghans*—which Mongol name is more frequently given to them than the Tibetan title *Bjang chub*—a translation of the Sanscrit *Bodhisattwa*. Their number is very great. These three degrees represent the clergy that claims to be the incarnation of the Buddhistic saints. The Dalai-lama and the Pan-chhen were in their former lives the two chief disciples of the great Lamaist reformer b'Tsong kha pa, who was an incarnation of the *Bodhisattwa Amitabha*, or, as some will have it, of Manjus'ri and Vajrapāṇi, and who is reputed

to have founded, in 1355 or 1357 of the Christian era, the present system of the Lama hierarchy. The *Khutuktus* were in their prior existences other Buddhistic saints of very great renown; and the *Khubilghans* are those reborn hosts of saintly patrons whom the temples and convents of Lamaism possess in boundless numbers. Up to the end of last century, the clergy of these various classes determined the choice of the children into whose bodies the souls of their departed members had migrated. At present, however, it seems that the emperor of China exercises a paramount influence on the discovery of those transmutations—or, in other words, on the filling up of clerical posts—and there can be no doubt that his influence is supreme in the case of determining the election of the two highest functionaries of this theocracy. In order to ascertain the re-birth of a departed Lama, various means are relied upon. Sometimes the deceased had, before his death, confidentially mentioned to his friends where and in which family he would re-appear, or his will contained intimations to this effect. In most instances, however, the sacred books and the official astrologers are consulted on the subject; and if the Dalai-lama dies, it is the duty of the Pan-chhen to interpret the traditions and oracles; whereas, if the latter dies, the Dalai-lama renders him the same service. The proclamation of so great an event, however, as the metempsychosis of a Dalai-lama or Pan-chhen is preceded by a close examination of the child that claims to be in possession of the soul of either of these personages. The reborn arch-saint, usually a boy four or five years old, is questioned as to his previous career; books, garments, and other articles, used and not used by the deceased, are placed before him, to point out those which belonged to him in his former life. But however satisfactory his answers be, they do not yet suffice. Various little bells, required at the daily devotions of the Lama, are put before the boy, to select that which he did use when he was the Dalai-lama or Pan-chhen. 'But where is my own favourite bell?' the child exclaims, after having searched in vain; and this question is perfectly justified; for, to test the veracity of the reborn saint, this particular bell had been withheld from him. Now, however, there can be no doubt as to the Dalai-lama or Pan-chhen being bodily before them: the believers fall on their knees, and the Lamas who successfully performed all these frauds join them in announcing the momentous fact.

Besides these three classes of the higher clergy—representing the incarnate existences of departed saints, and chosen, therefore, without regard to merit, amongst the children of privileged families—Lamaism possesses a lower clergy, which, having no claim to incarnate holiness, recruits its ranks on the principle of merit and theological proficiency. It has four orders: the pupil or novice, who enters the order generally in his seventh or ninth year; the assistant priest; the religious mendicant; and the teacher, or abbot. To these may be added two academical or theological degrees, and also two dignities, conferred by the sovereign Lamas on those doctors who have distinguished themselves by extraordinary sanctity or learning. All the members of these orders must make the vow of celibacy, and by far the greatest number of them live in convents. A Lamaist convent, *dGon pa*, consists of a temple, which forms its centre, and of a number of buildings connected with the temple, and appropriated to the meeting-rooms, the library, refectory, dwellings, and other spiritual and worldly wants of the monks. At the head of the convent is a *Khubilghan*, or an abbot, the latter being elected by

the chapter, and appointed by the Dalai-lama, or the provincial Khubilghan. In addition to these orders of monks and convents, Lamaism has likewise its nuns and nunneries.

The Lamaist bible bears the name of *bKa' gjur* (pronounced *Kanjur*)—i. e., 'translation of the words,' *scil.*, of the Buddha. It contains not less than 1083 works, which in some editions fill 102 to 108 volumes in folio. It consists of the following sections: 1. *Dulba* (Sanskrit, Vinaya), or discipline; 2. *Sher phjin* (Sana. Prajñāpāramitā), or philosophy and metaphysics; 3. *Phal chhen* (Sana. Buddhavata Sangha), or the doctrine of the Buddhas, their incarnations, &c.; 4. *dKon brTsog* (Sana. Ratnakūṭa), or the collection of precious things; 5. *mDo seDe* (Sana. Sūtra), or the collection of Sūtras; 6. *Mjang 'dass* (Sana. Nirvāṇa), or the liberation from worldly pains; 7. *rgJud* (Sana. Tantras), or incantations, &c. Besides this mass of works, there is a very voluminous collection, the *bes Tan 'gjur*, or the translation of the doctrine, in 225 vols. in folio; but it does not seem to possess canonical authority.

The oldest history of Lamaism is shrouded in darkness. For its growth and development under the Mongol and Manju dynasties, see the article **TIBET**.—The best work on Lamaism is *Die Lamaische Hierarchie und Kirche, von Karl Friedrich Koeppen* (Berlin, 1859). See also Huc, *Souvenirs d'un Voyage dans la Tartarie, le Tibet et la Chine* (Paris, 1852); and Karl Ritter's *Erkunde* (vol. iv.).

LAMA'NTIN. See **MANATEE**.

LAMARCK, JEAN BAPTISTE PIERRE ANTOINE DE MONET, CHEVALIER DE, a most distinguished French naturalist, was born of a noble family at Barentin, in Picardy, August 1, 1744. He was intended for the church, but preferred the army. An accidental injury, which placed his life in danger, put a stop to this career, and he became a banker's clerk. His first scientific pursuit was that of meteorology, from which he turned to botany, and attempted to introduce a new system of classification, which he called the Analytical System, but which met with little acceptance. In 1778, he published his *Flora Française* (3 vols.), which was afterwards made the basis of the work of Decandolle. Shortly after, he was appointed botanist to the king, and tutor to the son of Buffon, with whom he visited foreign countries, and inspected their botanical collections. He also contributed many botanical articles to scientific works. After a considerable portion of his life had been spent in the earnest study of botany, L. devoted himself chiefly to zoology, and in 1793 was made professor of the natural history of the lower classes of animals in the *Jardin des Plantes*. He rendered very important services to this branch of science. His greatest work is his *Histoire des Animaux sans Vertèbres* (7 vols. Paris, 1816–1822; 2d edition by Deshayes and Milne-Edwards, Paris, 1835, &c.). In his *Philosophie Zoologique* (2 vols. Paris, 1809), and some other works, he indulged in extremely speculative views, some of which, however, are attracting great attention in the scientific world at the present day. L. was the first (if we except a few obscure words of Buffon towards the close of his life) to set forth the theory of the 'Variation of Species,' which has been recently revived by Darwin. L. died 20th December 1829, after having been for seventeen years blind, in consequence of small-pox.

LA MARMORA, ALFONSO, MARQUIS DE, a Sardinian general and statesman, born 17th November 1804. In 1816 he entered the military academy,

where he received the grade of lieutenant in the artillery, previous to leaving in 1823. He was speedily promoted to be adjutant-major, and directed his special attention to the improvement of regimental gymnastics, riding, and shooting, and to the organisation of normal schools for the benefit of the private soldiers. In 1831, having obtained his captaincy, he set out on a tour of inspection of the great military establishments both of Europe and the East. In 1845, he became major, and for his distinguished conduct in the national war of 1848, was decorated with the medal of valour. The services he then rendered the Sardinian army removed from the mind of Charles Albert a prejudice which his warm advocacy of military reform had aroused in the king. In 1849, he entered the cabinet as Minister of War, and notwithstanding his sincere zeal for useful reforms, a general spirit of censure was evoked by his vigorous efforts to displace from the Sardinian ranks the Italian refugees who had entered the regular army. In 1855, he withdrew from the ministry, to assume the command of the Sardinian troops in the Crimea, and at the close of the war was invested with the Order of the Bath, and the Grand Cross of the Legion of Honour, and re-entered the ministry in his former capacity. He took an active part in the war of 1859, by which Lombardy was acquired by the king of Sardinia, and has been recently appointed military governor of Naples. A rigid disciplinarian and zealous military reformer, La M. belongs, by his political opinions, to the conservative Sardinian party, rather than to that of the party of progress, to whose irregular military combinations he is strongly averse.

LAMARTINE, ALPHONSE, was born at Mâcon, 21st October 1792. In his *Memoirs of my Youth*, he has given us a touching account of the hardships to which his family was subjected during the Reign of Terror. He was educated principally at the college of the Pères de la Foi, at Belley. On leaving college, he spent some time in travelling in Italy. After the fall of Napoleon, he entered the army, which, however, he soon quitted, revisiting Italy in 1818. In 1820, appeared his *Méditations Poétiques*. The success of this work helped to open up for him a diplomatic career. He was appointed *attaché* to the French embassy at Naples, and on his way thither married, at Geneva, a beautiful and accomplished English lady, Miss Birch, whom he had met the year before in the valleys of Savoy. In 1823 appeared his *Nouvelles Méditations*, and in 1824 he became secretary of the legation at Florence. An unlucky expression which L. had used, descriptive of the Italians, in his *Dernier Chant de Childe Harold* (1825), led to a duel between him and Colonel Pepé. Though L. was wounded, the result, luckily, was not serious. In 1829 appeared the collection of *Harmonies Poétiques et Religieuses*. In the same year he was elected a member of the French Academy. After the revolution of 1830, having failed to procure a seat in the Chamber of Deputies, he set out in 1832 to travel in the East. The death of his only daughter threw a gloom over this period of his life. Receiving news, when at Jerusalem, of his election by the constituency of Bergues, he returned to Paris. Though he soon became a noted speaker in the Chamber, he still vigorously pursued his literary studies. In 1835, he published an account of his eastern travels. The *History of the Girondins*, which originally came out in journals, was, in 1847, published complete in 8 vols. It had unquestionably much influence in bringing about the great events of the following year. When the Revolution took place in February 1848, L. became a member of the

Provisional Government and Minister of Foreign Affairs, and exercised a great influence over the first movements of the new republic. Ten departments elected him as their representative in the Constituent Assembly; he was also chosen one of the five members of the Executive Commission, and enjoyed for some months an immense popularity; whilst his spirited and patriotic conduct, in crushing the mere anarchic insurrections of the 16th April and 15th May, must be regarded as having prevented great evils. Yet this was one of the principal causes of his downfall; the crowd became enraged, the assembly hostile, and the supreme power passed for a brief period into the hands of Cavaignac (q. v.). Though L. was nominated for the presidency, but few votes were recorded in his favour; and the *coup d'état* of 2d December 1851 sent him back to private life. He has since given himself almost wholly to literary pursuits. His *History of the Revolution* of 1848 had appeared in 1849. It was followed, in 1851—1852, by his *History of the Restoration of Monarchy in France*; and in 1854, by the *History of Turkey*. He has also, up to the present time, contributed largely to several journals. L. is altogether one of the most remarkable Frenchmen of his day, and one of the most voluminous writers of his country. His style is picturesque and fascinating, but its effect is often marred by egotism and vanity.

LAMASOOL, or **LAMB'S-WOOL**, an old English beverage, composed of ale and the pulp of roasted apples, with sugar and spices. The name is from the ancient British *La maes abbal*, the day of apples, because this beverage was drunk at a feast on the apple-gathering in autumn.

LAMB, CHARLES, an English poet and essayist, was born in the Temple, on the 18th February 1775, and received his education at Christ's Hospital, where he had Coleridge for a school-fellow. With Coleridge, Wordsworth, Hunt, Hazlitt, and other distinguished men of his time, he lived in affectionate intimacy. In 1792, he became a clerk in one of the departments of the India House; and in 1825 he was allowed to retire with a pension granted by the directors. His first poems appeared in a small volume, in which venture Coleridge and Lloyd were his partners. In 1801, he published *John Woodvil*, a drama, in which he looks upon man and nature with the eye of an Elizabethan. His *Essays of Elia* were originally published in the *London Magazine*. L. was never married; he lived with an only sister, who was subject to insane fits—in one of which she killed her mother—and for whom he cherished the tenderest affection. He died in London, on the 27th December 1834. Since his death, Mr Justice Talfourd published two volumes of his *Letters*; and these, in 1848, he supplemented by the *Final Memorials*, in which, for the first time, the world became acquainted with the story of his sister.

The poems of L. were never widely read, nor are they yet; his reputation rests entirely upon his criticisms and his *Essays*. The critical remarks appended to his *Specimens of English Dramatic Poems* are of the highest value, while his *Essay on the Genius of Hogarth* is considered by many the finest critical paper in the language. In the qualities of grace, quaintness, and a certain tenderness of humour, 'a smile on the lip, and a tear in the eye,' the *Essays of Elia* are unique; the author is reflected in them with all his whims, his wit, his poetic instinct, his charity, and his odd ways.

LAMBALLE, MARIA THERESA LOUISE OF SAVOY-CARIGNAN, PRINCESS OF, a victim of the French

Revolution, was born at Turin, 8th September 1749, and was the daughter of Prince Louis Victor Amadeus of Carignan. She was very beautiful and amiable, and was married, in 1767, to Louis Alexander Joseph Stanislaus de Bourbon, Prince of Lamballe, who soon after died, a victim of debauchery. The princess became the intimate friend and chosen companion of Marie Antoinette. At the time of the attempted flight of the king and queen, she sought refuge in England, but returned to them in February 1792. After the events of the 10th of August, she received permission to share the captivity of the queen, but was soon separately immured in the prison of La Force, and on 3d September was brought before the tribunal, and commanded to swear that she loved liberty and equality, and hated the king, the queen, and royalty. 'The first oath,' she replied, 'I will swear, but the rest I cannot: my heart rebels against it.' Many of those who stood by were anxious that she should escape, but she did not hear the advices which they addressed to her. 'Let madame go!' said the president; and at this signal of death two men conducted her to the door, where she received a stroke of a sabre on the back of her head, when blood spouted up, and her long hair fell down. On receiving a second stroke, she fell, and the murderers tore her body to pieces, placed her head and heart upon pikes, and brutally paraded them before the windows of the Temple, where the royal family were confined.

LAMBEAU'X, a cross, in Heraldry, is a cross formed in the upper like a cross pattee, but with the lower limb not widened, but terminating in a label of three points, 'having,' according to Sylvanus Morgan, 'a great deal of mystery in relation to the top, whereon the first-born Son of God did suffer, sending out three streams from his hands, feet, and sides.'

Lambeaux.

LAMBERT, JOHANN HEINRICH, a philosopher and mathematician, was born 29th August 1728, of German parentage, at Mühlhausen, now in the department of Haut-Rhin, France. His talents and application to study having gained him friends, he obtained a good education, and made remarkable progress in mathematics, philosophy, and oriental languages. He obtained a situation as clerk in an office, and gradually rose, till Frederick the Great, in 1764, summoned him to Berlin, and made him a member both of the Council of Architecture and of the Academy of Sciences. He died at Berlin, 25th September 1777, leaving behind him the renown of having been the greatest analyst in mathematics, logic, and metaphysics that the 18th c. had produced. He was the first to lay a scientific basis for the measurement of the intensity of light, in his *Photometria* (Augsb. 1760), and he discovered the theory of the speaking-tube. In philosophy, and particularly in analytical logic, he sought to establish an accurate system by bringing mathematics to bear upon these subjects, in his *Neues Organon, oder Gedanken über die Erforschung und Beziehung des Wahren* (2 vols. Leip. 1764). Of his other works, we may mention his profound *Kosmologische Briefe über die Einrichtung des Weltbaus* (Augsb. 1761), and his correspondence with Kant.

LAMBERT, JOHN, an English parliamentary general, was born at Kirkby-Malhamdale, in Yorkshire, September 7, 1619, and on the outbreak of the Civil War, became a captain under Fairfax. He fought at Marston Moor, at Naseby, in Scotland, and at Worcester, but did not acquire importance

till after the death of the great Protector, when he became the head of the cabal of malcontent officers who overthrew the feeble administration of Richard Cromwell. L. was now looked upon as the leader of the Fifth Monarchy or extreme republican party; suppressed, with considerable vigour, the royalist insurrection in Cheshire, August 1659; and two months afterwards, dismissing the remnant of the Rump Parliament, virtually governed the country along with his officers under the title of the 'Committee of Safety.' For a brief period, his position was considered so important, that Charles II. was advised to make terms with him by marrying his daughter. The counterplot of Monk, however, frustrated all his designs; and on the 22d of April he was taken prisoner by a Colonel Ingoldsby, tried in 1662, and banished to the isle of Guernsey, where he died in 1692.

LAMBETH, a parliamentary borough of England, in the county of Surrey, forms a great part of the south-west quarter of London. It is said to cover an area of 8840 acres, and had, in 1861, a pop. of 294,883. Besides Lambeth Palace, which has been the official residence of the archbishops of Canterbury for several centuries, it contains Astley's Theatre, the site of the once famous Vauxhall Gardens, and the Surrey Zoological Gardens. It returns two members to the House of Commons.

LAMBERQUIN, a word used in Heraldry in three senses: 1. The mantling attached to the helmet, and represented as depending over the shield (see MANTLING); 2. A Wreath (q. v.); 3. The point of a label. See LABEL.

LAMB'S LETTUCE. See CORN SALAD.

LAMEGO, an old town of Portugal, in the province of Beira, is situated amid rocky mountains on an affluent of the Douro, about three miles from that river, and forty-six miles east of Oporto. It contains a Gothic cathedral; and there are ancient remains both Roman and Moorish. Pop. 8500.

LAMELLIBRANCHIATA, a class of accephalous molluscs, all of which have bivalve shells (see BIVALVUS), and which respire by gills in the form of vascular plates of membrane attached to the inner surface of the mantle. Oysters, cockles, and mussels are familiar examples. The adductor muscle, which closes the shell, is single in some, double in the greater number. More important differences exist in the powers of locomotion possessed by some, and denied to others. Thus, oysters are fixed to one spot by one of the valves of the shell; but most of the L. have the power of moving by swimming, leaping, or burrowing in sand, sometimes in more than one of these ways, being provided for this purpose with a fleshy muscular organ called the foot. Some, as mussels, when they have found a suitable place, fix themselves there by a *Scytus* (q. v.). The mouth of the L. is jawless and toothless, and all seem to depend for their food on the currents of water continually brought by ciliary action into the mouth. They all seem more or less sensible to light, and numerous small red spots on the edge of the mantle of some are supposed to be eyes. They have organs of hearing, and labial tentacles, which are supposed to exercise the sense of smell.

LAMELLICORNES, a very numerous family of coleopterous insects, of the section *Pentamera*, containing the largest of the beetles, as well as many species remarkable for peculiar conformations of the head and thorax. The three last joints of the

antennae are flattened into lamellae, which are sometimes disposed like the leaves of a fan, sometimes like teeth of a comb. Many of the L. feed on decaying animal or vegetable matter, but some on leaves or flowers; the latter are generally of brilliant metallic

Lamellicornis:
Stag-Beetle (*Lucanus cervus*).

colours; the former, black or brown. The larvae are soft, cylindrical, with six small legs, and the body always curved. Dung-beetles, stag-beetles, cock-chafers, &c., belong to this family.

LAMELLIROSTRES, in the system of Cuvier, a large group of web-footed birds (*Palmipedes*), distinguished by a thick bill having tooth-like lamellae at its edges, apparently more for the purpose of straining water from the food than of masticating or comminuting it. The *Anatides* and *Mergides* (ducks, swans, geese, goosanders and mergansers) constitute the group of Lamellirostres.

LAMENNAIS, **FÉLICITÉ ROBERT DE**, one of the most celebrated of the politico-religious writers of France during the present century, was born of a family engaged in the shipping-trade at St Malo, June 8, 1782. With the exception of some instruction in Latin, which he received from his elder brother, L. was, owing to the revolutionary troubles, almost entirely self-taught. His early turn of thought was strongly religious, as well as decidedly literary; and resisting all his father's efforts to fix him in commercial life, he pursued a literary career, and in 1807 received an appointment as teacher of mathematics in the college of his native town. His first work, published in the next year, *On the State of the Church in France during the 18th Century*, is written in a strain of high orthodoxy, and directed against the materialistic philosophy of the 18th c., its influence still subsisting in the literature of his own time. A few years later—having meanwhile taken the clerical tonsure—he produced, in conjunction with his brother, a treatise *On the Tradition of the Church on the Institution of Bishops*, which arose out of the conflict of Napoleon with the Holy See as to the affairs of the church in France. During the Hundred Days, he was obliged to flee to England, where he was received by the celebrated Abbé Caron; and on his return to France, he entered the seminary of St Sulpice, where he received priest's orders in 1816. A year afterwards, he published his most celebrated work on the side of orthodoxy, *An Essay on Indifference in Religion*, which is a work of exceeding acuteness, and of great learning and brilliancy. In this work, however, he pushes the claim of authority to such a length, and makes all reasoning resolve itself so completely into authority, that even those who agreed in the conclusion at which he arrived, were not surprised at the recoil by which, this principle

LAMENTATIONS OF JEREMIAH—LÄMMERGEIER.

of authority once abandoned in his after-conflict with the church, his mind rushed into the opposite extreme of utter and unlimited unbelief. The celebrity which this work won for him led to a design on the part of the pope, Leo XII., to promote L. to the cardinalate. This design, however, was afterwards abandoned. L.'s political views, from the first moment of the Restoration, had been liberal. Nevertheless, he joined himself to a powerful and active section of the most distinguished members of the royalist and church party—Chateaubriand, De Bonald, Frayssinous, and others, the organ of which was a journal named the *Conservateur*, and afterwards the *Defenseur*, and the *Drapeau Blanc*; but he rapidly outstripped the views of most of his colleagues. He was fined, in 1824, for a work *On the Relations of Religion and Politics*. After the revolution of 1830, while he adopted in its fullest sense the doctrine of the sovereignty of the people, he continued a zealous adherent of the faith of the church; and, in conjunction with a number of ardent young friends, all of whom have since risen in their various lines to distinction—Montalembert, Lacordaire, Gerbet, and others—he established a journal called *L'Avenir*, the aim of which was to reconcile liberty and religion. The doctrines of this journal on the separation of church and state and on many other popular topics, gave grave offence to the ecclesiastical authorities. They were censured by the pope, Gregory XVI., in 1832; and L., in obedience to the papal sentence, discontinued his journal, and professed his future submission to authority; but from this date his opinions underwent a rapid change, and in a work which he published in the year 1834, and which obtained an immediate and unprecedented popularity in France, *Paroles d'un Croquant*, proclaimed his complete and irreconcilable rupture with the church of which he had long been the champion. The work was immediately condemned at Rome; but it passed in France through innumerable editions, and was translated into all the languages of Europe; and the author's reply to the papal condemnation was in a still more pointedly aggressive work, in 1836, entitled *Affaires de Rome*. With his characteristic impetuosity, he now threw himself into the arms of the opposite party. His successive publications, *The Book of the People* (1837), *The Country and the Government* (1840), *On Religion* (1841), *The Guide of the First Age* (1844), *A Voice from Prison* (1846), were but so many new utterances of the most extreme democratic principles. The revolution in his religious sentiments was equally decisive and complete; he not merely ceased to be a Romanist, but even a believer. In his last illness, he declined all religious ministrations; and at his death, which occurred February 27, 1854, he gave directions that his interment should not be marked by any religious ceremony. He also directed, by his will, that certain papers which he left ready for press should be published without alteration; and on the refusal of his niece to surrender these papers, a suit-at-law was instituted, which terminated in an order for the surrender of the papers, in accordance with the will of the testator. The most elaborate work of L.'s latter period is his *Esquisses d'une Philosophie* (4 vols. 1840—1846).

LAMENTATIONS OF JEREMIAH (*Megillath Echa*; *lxx. Threnoi*), the name given to one of the canonical books of the Old Testament, containing laments over the desolation of the land, the exile of the people, the destruction of the first temple, the fall of the kingdom of Judah, and the writer's own woes. These laments are five in number, and are

closely connected in regard to their subject-matter; but considerable diversity of opinion exists concerning their artistic relation to each other. Some, as De Wette, Ewald, and Keil, have tried to shew that they are really parts of one poem; others, as Eichhorn and Bertholdt, that they were originally quite independent and isolated elegies; while a third party, as Lowth and Davidson, hold that there is a certain pervading harmony of sentiment and idea, indicating, probably, that they were composed by the poet-prophet under the same condition of religious feeling. The structure of the laments is very artificial. Most critics are satisfied, from internal evidence, that the tradition which makes Jeremiah their author is worthy of credence, and that they were all written by him shortly after the destruction of Jerusalem.

LAMINARIA. See TANGLE.

LAMINATION, the arrangement of rocks in thin layers or laminae, the condition of a large proportion of the earth's strata. Shale deposits exhibit this structure very plainly, being frequently easily separable into the thin laminae in which they were originally deposited. Shale is the fine sediment that settles down at the bottom of some tranquil or slightly moving water. The laminae indicate interruption in the supply of the materials, which may have been occasioned by successive tides, by frequent or periodical floods, or by the carrying medium having access to a supply of different material, passing, e.g., from mud to sand, and back again to mud. The laminae of the brick-clay deposits are separated, in many places, by the finest sprinkling of sand, which is almost invisible in the vertical sections. The layers are occasionally obvious, from their being of different shades of colour, often produced by the bleaching of the layers when they were deposited; but frequently the various laminae of a bed are so united, and the bed so homogeneous, that except when the face is exposed to weathering, the laminated structure is not visible. This condition seems to have resulted from the shortness of the interruptions in the deposit not permitting the solidification of any of the layers until all was deposited, when the whole set cohered together as a single bed.

LA'MMAS-DAY, the 1st of August, is one of the cross quarter-days, or half-quarter days, in England. On this day, which is the feast of St Peter ad Vincula, it was customary in early times to make offerings of the first-fruits of the harvest, and hence the feast took the name of *Hlafmæsse* (Ang.-Sax., loaf-mass or loaf-festival), afterwards corrupted into Lammas. In Scotland, it is the practice with farmers to pay the half year's rent due at Whitsunday on Lammas-day.

LÄMMERGEIER (*Gypsaltes barbatus*), a large bird of prey, also called the **BEARDED VULTURE**, **BEARDED GRIFFIN**, and **GREY-EAGLE**. It is the only known species of its genus, which forms a connecting link between vultures and eagles, although commonly ranked among the *Vulturidae*, to which it approaches most nearly. The full-grown L. is of a shining brownish black on the upper parts, with a white stripe along the shaft of each feather; the head is whitish, with black stripes at the eyes; the neck and under-part of the body are rusty yellow. It is 4 feet high when sitting; nearly 5 feet long; and from 9 to 10 feet in expanse of wing. It is very bold and rapacious, swooping down on hares, lambs, young goats, chamois, &c., and sometimes carrying off children. It lives on animals newly killed, eating carrion only when pressed by necessity. It was once pretty common in the Alps, but is now rare.

It is found also in the Pyrenees, and in the mountains of Asia, South America, and the north of

became *devout*, as his countrymen phrase it; and when the Italian war of independence threatened the safety of the pope, L. proceeded to Rome in 1860, and was appointed by Pius IX. commander of the papal troops. He was, however, compelled to surrender with his whole force to the Sardinian general, Cialdini, at Ancona.

LAMP-BLACK, the soot produced by burning resin, turpentine, pitch, oil, and other matters, in such a manner that large volumes of smoke are formed and collected in properly arranged receptacles. Lamp-black is the colouring matter of black and slate-coloured paints.

Large quantities of this pigment are made in Germany by burning the refuse resin and fragments of fir and pine trees. The combustion is carried on slowly, and the dense smoke passes up a long flue, at the top of which is a large hood made of coarse woollen cloth. In this hood the carbon is deposited rapidly at the rate of twenty to thirty pounds an hour, which is collected by lowering the cloth hood, and shaking it out. In Great Britain, a similar process is adopted; but large quantities of an inferior kind are also collected from the flues of coke-ovens; and a superior kind, known as *bone-black*, is obtained from the flues of kilns in which bones are calcined for manure. By mixing lamp-black in various proportions with white-lead, every gradation of colour, from jet black up to slate and gray, can be easily produced.

LAMPREY (*Petromyzon*), a genus of cartilaginous fishes, Dermopterous (q. v.), and having a circular mouth formed for sucking (*cyclostomous*). They are of eel-like form, and have no scales. The skeleton is very soft and imperfect. The tongue acts as a piston in the sucking mouth, which is armed with numerous hard teeth, or tooth-like tubercles. There are seven roundish gill-orifices on each side; the German name is *Ness-Auge* (Nine-eyes). Lampreys have the power of drawing in as well as of expelling water through the gill-orifices, and thus respiration is carried on even when they are firmly attached to some object by the sucking mouth. Lampreys often attach themselves very firmly to stones, and seem to rest

Lammerglais (*Gypsalis barbatus*).

Africa, and will soar high above the loftiest peaks.

LAMMERMOORS, a range of low hills in Scotland, running in an east-north-east direction for one half of their length on the boundary-line between East Lothian and Berwickshire, the other half lying in the south-eastern corner of the former county, and forming, where it meets the German Ocean, a bold, rocky, and dangerous coast. The L. send off several minor ranges southwards into Berwickshire. The highest summits are Lammer Law (1732 feet) and Spartleton (1534 feet).

LAMORICIERE, CHRISTOPHE LÉON LOUIS JUHAULT DE, a French general, was born at Nantes, 5th February 1806, studied at the Ecole Polytechnique, and after the revolution of 1830, went to Algeria as a lieutenant of engineers. In 1833, he became chief of the battalion of Zouaves; in 1835, lieutenant-colonel; and in 1837, colonel. He particularly distinguished himself at the siege of Constantine. In 1843, he was appointed a general of division; in the following year, commander of the Legion of Honour; and in 1845, interim-governor of Algeria. To him belongs the glory of concluding the war in Africa, where he had made no fewer than eighteen campaigns, by forcing Abd-el-Kader to surrender in 1847. On the outbreak of the revolution in February 1848, he nearly lost his life in endeavouring to proclaim the regency of the Duchess of Orleans. In June 1848, he commanded the attack on the barricades, and quelled the anarchic tumults of the Socialists. He was war-minister during the government of General Cavaignac, to whose republican party he afterwards attached himself in the Legislative Chamber; but being a very decided opponent of the schemes of Louis Napoleon, he was arrested on the occasion of the *coup d'état* of 2d December 1851, and at first imprisoned in Ham, but afterwards conveyed out of France, and set at liberty. He has since lived in Germany, Belgium, and England. During his exile, the great soldier

Common Lamprey (*Petromyzon marinus*).

with the body floating in the water; they live by sucking the blood of fishes, the skins of which their teeth readily pierce, and which are unable to shake them off. They eat also any soft animal matter. The species are numerous, and are widely distributed in the seas of different parts of the world. Some of them are periodical visitors of fresh waters, as the Common L. (*P. marinus*), found on the shores and in the rivers of most parts of Europe. It sometimes attains a length of more than three feet, and is often two feet long. It ascends rivers in the latter part of spring or beginning of summer, for the

purpose of spawning. It was formerly in the highest esteem for the table, and it is an old custom for the city of Gloucester to present a L. pie annually to the sovereign. Worcester is also famous for its L. pies and potted lampreys. In Scotland, a strong prejudice exists against the lamprey.—The L. of North America, although very similar, is said to be a distinct species (*P. Americanus*).—A smaller species, the River L. (*P. fluviatilis*), often called the LAMPREY, is very abundant in some of the rivers of England, at certain seasons of the year. It is seldom more than 15 or 18 inches long, blue above, silvery white beneath. It is used for pies, like the common lamprey.—A little blood thrown into water where lampreys are supposed to be, soon attracts them to the spot. They are caught by baskets and other traps, like eels. They are very tenacious of life, living for days in a damp place, out of the water.

LAMPS are contrivances in which to burn any light-giving material, and so make use of its illuminating power. The most primitive lamps were probably the skulls of animals, in which fat was burned; and certain sea-shells formed admirable lamps for those to whom they were attainable. Even at the present time, occasionally may be seen suspended in the cottages of Zetland, shells of the 'roaring buckie' (*Fusus antiquus*, q. v.), which form, perhaps, the most ancient kind of lamp in existence.

When pottery and metal began to be used, the principle of these natural lamps was for a long time retained, as seen in ancient Egyptian, Greek, and Roman lamps (fig. 1), and in the stone cups and boxes of northern nations. The invention of lamps has been attributed to the Egyptians, but it is far more probable they received it from the older

used, and being partly filled with grease, a wick was thrust down through the middle, and being lighted, consumed the fat as it melted. Stone cups of this kind are occasionally dug up in Scotland and elsewhere: in principle, they are the same as the padelle, used in Italian illuminations, and the old grease-pots, which formed the foot-lights of our theatres not many years since, and which may still occasionally be seen in the travelling-shows at country fairs. The Equimanx form square boxes of soap-stone, and use them in the same way.

No great improvement took place in the construction of lamps until the beginning of the present century. Taste had been shewn in the designs, but the principle remained the same; a wick sucking up oil from the reservoir of the lamp to supply itself during combustion, and nothing more, if we except the improvement effected by the invention of M. Argand in 1784. See ARGAND. In 1803, M. Carcel, another Frenchman, made an excellent improvement on the lamp by applying clock-work, which acts by raising the oil up tubes in connection with the wick, so that the latter is kept continually soaked. If properly managed, this is perhaps the best of all oil-lamps, as it will keep up a well sustained and brilliant light for seven or eight hours, and the light rather increases than otherwise as the lamp burns and becomes warmer, thereby rendering the oil more

Fig. 1.

civilisation of India. Herodotus (ii. c. 62) reminds us of the Chinese feast of lanterns, by speaking of the feast of lamps at Sais, in Egypt. Such lamps as that in fig. 1 were called *lychna* by the Greeks, and *lucernæ* by the Romans, and various modifications of the form are frequently found in the ruins of Greek and Roman cities; very considerable numbers have been obtained from the excavations of Tarsus and of Pompeii and Herculaneum. The principle in all is the same. At first, these *lucernæ* were made of unglazed pottery, and only with one wick-hole; but better material and more elaborate forms were introduced, and their light-giving power was increased by their being made to hold several wicks, from two to twelve. The wick used in this lamp was generally made of flax-tow, sometimes, however, of rushes and other vegetable fibres.

Amongst the northern nations of antiquity, lamps were in use, but the difference of climate necessitated a different kind of lamp. The limpid oils of the present day were unknown to our Celtic and Saxon forefathers; besides, the cold winters would have solidified them, and they would not have been drawn up by the wick, if arranged as in the old Roman and Greek *lucernæ*. The solid fat of various animals was their chief illuminating material, except on the sea-coast, where seal and whale oil occasionally helped them. Small open stone pots, afterwards exchanged for metal, were

Fig. 2.

Fig. 3.

limpid. But the Carcel lamp has two disadvantages: it is expensive, and is easily disarranged, therefore it has never become common.

The greatest improvement ever effected in oil-lamps was in the so-called French moderator (fig. 2),

which combines the greatest amount of illuminating power with elegance of form, easy management, and general economy. Its body is a cylinder, B, usually about 8 inches in height by 5 inches in diameter, the lower part of which contains the store of oil. On the top of the oil rests a piston, P, which is constantly pressed down by a spiral spring situated between it and the top of the barrel. The piston is represented in the figure as resting on the bottom. Through the piston is inserted a small tube, which passes up to the burner at the top; and the pressure of the spring on the piston causes a constant stream of oil to rise up through this tube and feed the wick, C. What is not consumed, flows over the burner, D, and back into the barrel above the piston. It is above the piston also that fresh oil is introduced. When the piston has reached the bottom, it is wound up again by a rack and pinion, E; and a vacuum being thus formed, the oil above it is forced to the underside through a valve-kind of contrivance round its edge.

It is obvious that in this machine the flow of oil will be greatest when the piston has been newly wound up, and the spring is at its greatest tension. This inequality is regulated, or *moderated*—hence the name of the lamp—by an extremely ingenious contrivance. The tube through which the oil ascends (represented in fig. 3 on an enlarged scale) consists of two parts—a narrower, *b*, fixed to the piston, and rising with it, and a wider, *c*, fixed to the burner, and forming a sheath into which the other ascends. Within the upper tube is placed a rod or wire, G, which descends so as to enter only a short way into the tube *b*, when the latter is drawn down to the full, as represented in the figure. Now, the effect of the rod within the narrow tube at *r* is to retard the passage of the oil; and it is evident that the effect will be greater the further the tube *b* is pushed up, because the narrow part is then made longer. The obstruction thus increases and diminishes with the force of the spring, and the flow of oil is rendered equable.

The use of oil-lamps has been greatly diminished by the rapid extension of gas-works, and by the invention of lamps to burn camphine, which is rectified oil of turpentine, and the various kinds of naphtha petroleum and paraffine oils.

Fig. 4.

These lamps require to be formed so as to insure perfect combustion of the material, for which purpose the reservoir of fluid is placed much below the flame, and the wick passes into it and sucks it up by capillary attraction. The glass chimney which surrounds the wick is always made very narrow at the bottom and top, with an enlargement round the flame (fig. 4). This figure insures a great indraught of air at the bottom, which keeps the combustion so perfect, that in a well-made lamp the smoke is imperceptible; in addition, there is an arrangement surrounding the wick-tube for admitting air, and bringing it into contact with the flame. These lamps give a most brilliant light; and as they not only have greater illuminating power, but are of cheap construction, and are very economical in other respects, they have come into very extensive use. Much care is required, however, in the selection of the fluid to be burned; some of the newly discovered petroleum and rock-oils are so very inflammable and explosive, that their use is dangerous. That made from the Torbanehill coal is free from danger, and is one of the most brilliant in burning.

LAMP-SHELL (*Terebratula*), a genus of brachiopod molluscs (see BRACHIOPODA), having a delicate

shell, of which one of the valves is larger and more convex than the other, prolonged backwards into a kind of beak, which is pierced by a hole or fissure. Internally, there is a delicate bony framework, of two branches, attached to the dorsal valve, by which the *arms* (see BRACHIOPODA) are supported. This is called the *loop*, and often by shell-collectors the *carriage-spring*. It is well seen in many fossil *Terebratula*. The recent species are numerous, and very widely distributed from the polar to the tropical seas; the fossil species are extremely numerous.

LAMPYRIS and LAMPYRIDÆ. See GLOW-WORM.

LANARK, a parliamentary and municipal burgh and market-town of Scotland, in the county of the same name, is situated on an elevation rising from the Clyde, 30 miles south-west of Edinburgh. Its antiquity is attested by the fact, that here, in 978, Kenneth II. assembled a parliament, or meeting of the estates of the realm. Little trade is here carried on; but the town derives some support from the numbers attracted to this district by the beauty of the scenery in the vicinity. L. unites with Hamilton and three other burghs in sending a member to parliament. Pop. (1861) 5384.—About a mile to the south, lies the manufacturing village of NEW LANARK (pop. 1396), celebrated as the scene of Robert Owen's experiment (1815–1827) for the social improvement of the working-classes.

LANARKSHIRE, or CLYDESDALE, an inland county of Scotland, lies west of the shires of Edinburgh, Linlithgow, and Peebles. Its length is 54 miles, and width 34 miles. Its area is 889 square miles, or 568,867 acres, of which there are under cultivation 321,568 acres. This county is subdivided into upper, middle, and lower wards. The first of these comprises more than one-half of the county, and consists in a great measure of hills and moorish ground; the second contains about 160,000 acres, much of which is unprofitable; the third, which contains the city of Glasgow, is nearly all cultivated, although very little of the soil, unless that bordering on the Clyde, is of first quality. The principal hills are the Lowthers, which rise in Green Hill to the height of 2403 feet; Tintock is 2335 feet high. In the upper ward is the village of Leadhills, which is 1323 feet above sea-level, being the highest inhabited place in Scotland. This county possesses great mineral wealth. There are upwards of 150 collieries, and 13 iron-works, having nearly 90 furnaces in blast. The cotton, flax, silk, and woollen factories (described in the article GLASGOW) are very extensive, and constitute one of the most important sources of wealth in the country. The county is watered principally by the Clyde (q. v.) and its affluents. L. was famous for its orchards as early as the time of the Venerable Bede. They yielded, early in the present century, as much as £8000 yearly, but have latterly fallen off; and the ground is more profitably employed in producing gooseberries, vegetables, &c., for the Glasgow market. The climate of L. is moist, and in many of the lower districts mild and genial, but often cold and boisterous in the high grounds. It is not in general well suited for raising grain-crops; but much of it is excellently adapted for the rearing of stock and for dairy purposes. In 1857, the number of occupants of land was 2931, and the total acreage under rotation was 321,568; of which there were 8363 acres of wheat, averaging 37 bushels 1½ pecks per acre; 2142 barley, 36 bushels 3¼ pecks; 57,041 oats, 36 bushels ¾ pecks; 11,934 acres turnips, averaging 17 tons 1½ cwts. per acre; and 8263

LANCASHIRE—LANCASTER.

acres potatoes, 4 tons 9½ cwts. Of live-stock, the numbers were—horses, 8583; cattle, 59,108; sheep, 174,746; swine, 8006; total stock, 250,443. L. contains 55 parishes. It is amply supplied with railways, and good roads in almost every direction. Besides Glasgow, L. contains the royal burghs of Lanark, which is the county town, and Rutherglen, the towns of Hamilton, Airdrie, &c. L. sends one member to parliament; constituency, 5202. The pop. in 1861 was 631,566.

LANCASHIRE, one of the largest and the most populous counties in England, is bounded on the E. by Yorkshire, and on the W. by the Irish Sea; on the N. by Cumberland and Westmoreland, and on the S. by Cheshire. Area, 1,219,221 statute acres. Pop. 2,429,440. Increase in ten years, from 1851 to 1861, 411,843 souls. Annual value of property, including railways and canals, rated under schedule A, in 1857, £10,458,243; annual value upon which direct taxes were paid in 1857, including property, land, occupiers, and income taxes, £23,321,000. An outlying portion of the county, called Furness, whose greatest length is 25 miles, and greatest breadth 16 miles, is separated from the main portion by Morecambe Bay. The larger division is intersected in the north and east by branches of the hill system which runs southward through the counties of York and Derby, while Furness has on its eastern border the Cumbrian range. Towards the coast on the west the surface is flat, particularly in the larger division, with a curving outline and large stretches of sand, over which in various places the sea seems to be extending its dominion. The chief rivers are the Mersey, Ribble, Lune, Winstar, Leven, and Duddon, all of which enter the Irish Sea by estuaries more or less important; Morecambe Bay, being the chief indentation. The climate is moist, but mild, the soil being peaty in the upland districts, but a fertile loam for the most part in the flats. Oats and potatoes are general crops; wheat also grows well in the southern division. Coal is the chief mineral product (the coal-field being estimated at 400 square miles in extent); lead and copper also occur, and iron is plentiful in Furness. The whole surface is covered with a net-work of canals and railways, which connect the principal manufacturing and commercial centres. See MANCHESTER, LIVERPOOL, PRESTON, BLACKBURN, &c. L. is famous for its immense cotton manufactures, which employ 315,630 persons almost wholly within the limits of the county. The consumption of cotton in 1860 was 2,392,000 bales of 400 lbs. each, and the value of the product was about £80,000,000, of which about £50,000,000 worth was exported. L. returns five members to parliament for the county, and twenty-two for boroughs within the county. The district of Furness presents many attractions to the tourist. On its north-eastern border stretches the beautiful lake Windermere, westward from which is Eastwaite Water; and further west, Conistone Lake, and the 'Old Man of Conistone,' with a height of 2577 feet. In the peninsula between the rivers Duddon and Leven is Furness Abbey, a noble ruin, the effect of which is enhanced by the picturesque beauty of the scenery in the vicinity. The abbey was founded by Stephen, Earl of Mortagne or Mortoil, and afterwards king of England in 1127. The church is 287 feet long, the nave 70 feet broad. In the township of Whalley, in the east of L., is a very old church, and in the churchyard are three crosses, apparently of Saxon origin. In the vicinity are the ruins of an abbey of about the same age as Furness. A few miles from Whalley is the Roman Catholic college of Stonyhurst. The educational endowments of L. amount to upwards of £40,000

per annum, nearly £12,000 of which belongs to grammar-schools.

LANCASTER, a municipal and parliamentary borough and seaport of England, capital of Lancashire, is picturesquely situated on an eminence on the left bank of the Lune, near the mouth of that river, and 230 miles north-north-west of London. The ancient castle, which overlooks the town, is now used as a county jail and court-house. The houses are built of the freestone quarried in the vicinity, and though the streets are narrow, the town is neat and well built. The Lune is here crossed by a bridge of five arches, and by an aqueduct carrying the Lancaster Canal across the river. The town contains numerous scientific, benevolent, and educational institutions. There is some trade in coal and limestone. The chief manufactures are furniture, cotton, silk, table-baize, American leather, cloth, and cast-iron work. L. returns two members to the House of Commons. In 1862, 2423 vessels, of 302,583 tons, entered and cleared the port. Pop. (1861) of parliamentary borough, 16,006.

LANCASTER, a city of Pennsylvania, United States of America, 68 miles (by rail) west of Philadelphia, on the Pennsylvania Central Railway. The Conestoga river, made navigable by dams and locks, runs through the city, and supplies it with coal and lumber. It has a large court-house and prison, a theatre, 20 churches, Franklin and Marshall College, high-school, 1 daily and 6 weekly papers, 3 cotton factories, iron foundries, &c. It is particularly celebrated for the manufacture of rifles. Pop. (1860) 17,603.

LANCASTER, DUCHY OF. L. is a duchy and county palatine (see PALATINE) of England, created by royal charter, in which respect it differs from Durham and Chester. Edward III., on the death of Henry, Duke of Lancaster, conferred the duchy on John of Gaunt and his heirs for ever. During the Wars of the Roses, Henry IV. and Edward IV. both endeavoured so to settle the duchy that it should descend to the heirs of their body apart from the crown, and continue with them in the event of their losing the latter. The result of these several attempts has been the preservation of the duchy as a separate possession in order and government, but united in point of inheritance. The revenues of the duchy form no part of those hereditary revenues in lieu of which the Civil List (q. v.) was granted. The net proceeds are paid over to the Privy Purse, and wholly exempted from parliamentary control, except that the annual account for receipt and expenditure is presented. The county palatine forms only a portion of the duchy, which includes considerable estates not within the county palatine. There is a chancellor of the duchy (i. e., of the part of it which does not lie within the county), and of the county palatine, which two offices are generally united. The Duchy Court of Lancaster, held at Westminster, and presided over by the chancellor of the duchy, or his deputy, exercises jurisdiction in all matters of equity relating to the lands of the duchy. The administration of justice has recently been assimilated to that of the rest of England. The office of chancellor is a political appointment, which it is the practice to confer on a statesman of eminence, frequently a member of the cabinet, who is expected to devote his time to such larger questions occupying the attention of government as do not fall within other departments. The emoluments of the office are about £2000 per annum. By 17 and 18 Vict. c. 12, the chancellor of the duchy, with the two lords justices of the Court of Appeal, form the Palatinate Court of Appeal.

LANCASTER, SIR JAMES, the first English navigator who commanded a fleet bound for the East Indies, sailed from Plymouth, 10th April 1591. In 1600, the newly constituted *East India Company* intrusted him with their first expedition. L. having, in the course of his voyages, collected a number of valuable documents in support of the existence of a north-west passage, the government, acting on his advice, sent out an expedition to attempt to discover it. They discovered a strait in 74° N. lat., which was named by Baffin *Lancaster Sound*, in honour of Lancaster. L. was created a baronet for his services, and died in 1620. The history of his voyages has been preserved by Hakluyt and Purchas.

LANCASTER, JOSEPH. See **BELL, ANDREW**, and **MUTUAL INSTRUCTION**.

LANCASTER GUN, a species of rifled cannon, which has been partially adopted in the British service. When the great difficulty of rifling heavy ordnance to an extent to give a sufficient rotary motion to the projectile became apparent, Mr Lancaster devised a plan by which grooves might be dispensed with altogether. Instead of a strictly circular bore, he gave his gun an elliptical bore, the ellipse being of very small eccentricity. The major axis was not in one plane from end to end of the gun, but was made to revolve in the length, until it had moved round one-fourth the periphery of the ellipse. The projectiles are, of course, elliptical also; elongated, and somewhat pointed in front. When the shell is projected, it must follow the twist in the bore, and the rotary motion thus imparted is retained to the end of the range. The effect of this will be explained under **RIFLED ORDNANCE**. Several Lancaster guns were employed at the siege of Sebastopol, and some of them burst. But these were scarcely fair specimens, being service 8-inch guns (with circular bore) bored to Mr Lancaster's elliptical standard, and therefore weakened. The wrought-iron guns on his special model promise, however, more certain results, which, as experiments are still in progress, will be better given under **RIFLED ORDNANCE**.

LANCASTER HERALD, one of the six heralds of England, ranking second in point of seniority. His office is said to have been instituted by Edward III., in the 34th year of his reign, when he created his son, John of Gaunt, Duke of Lancaster. Henry IV. raised Lancaster to the dignity of a king-at-arms. Edward IV., after reducing him back to the status of a herald, abolished his office, which was revived by Henry VII.

LANCASTER SOUND, a western inlet of Baffin's Bay, in lat. 74° N., and extending from 80° to 87° W. long. Though this opening into the polar ocean was discovered by Baffin himself, as far back as 1616, yet it lay virtually neglected for more than 200 years. At length Parry, in 1819, penetrated through it into Barrow's Strait, and, beyond it, to the North Georgian Islands.

LANCE differed from spear or javelin in that it was not intended to be thrown, but to be thrust at the enemy by force of hand, and with the impetus acquired by speed, and thus was most effective in the hands of a mounted soldier. Hence the lance was the favourite arm with knights for commencing a combat; it was of tough ash, of considerable length, weighted at the end, and held not far from the hilt. See **TOURNAMENT**. In modern warfare, the lance is a long rod of tough ash, with an iron point, and usually a coloured flag near it. It is the offensive arm of **LANCERS** (q. v.).

LA NOËLET (*Amphioxus*, or *Branchiostoma*), a genus of Dermopterous (q. v.) fishes, of very remark-

able organisation, far lower than that of any other vertebrate animals, connecting cartilaginous fishes both with molluscs and with annelids. A few species are known, all small; one of them (*A. lanceolatus*), the first which was discovered, a native of the coasts of Britain and of Europe generally. It inhabits banks of sand, and when dug up, buries itself again in the sand with wonderful activity. It is at the utmost scarcely more than two inches in length, very much compressed, tapering to a point at each extremity, the head not notably distinct from the body. It is silvery white and semi-transparent; the skin destitute of scales. A low dorsal

Lancelet (*A. lanceolatus*):

a, mouth, seen from below; b, general figure; c, hyoid bone, with filaments attached.

fin extends the whole length of the back. The skeleton is merely rudimentary, the spine being represented by a fibrous sheath, containing a great number of transverse membranous plates. There is no vestige of a skull, or any enlargement of the spinal cord into a brain; nor is the L. furnished with organs of sight or of hearing. The mouth is situated beneath that part of the body which may be regarded as the head; and is surrounded by a cartilaginous ring, in several pieces, each of which gives off a prolongation to support cirri, or short filaments. The mouth communicates with a wide and long cavity, which contains the organs of respiration, and from the other extremity of which the alimentary canal proceeds. The L. does not eat or swallow, but simply imbibes its food, along with the water which supplies air for respiration. The intestine is slender and almost straight; but there is a very long oesum. The walls of the respiratory cavity and the intestine are covered internally with vibratile cilia. The blood is colourless. Instead of a heart, there are several elongated blood-vessels, which contract successively; and at the commencement of each of the vessels connected with the organs of respiration there is a little contractile bulb. The muscular system accords with that of the higher fishes.—The very anomalous structure of the L. has led to the supposition, that this genus may represent a family or order once more numerous, but belonging rather to former geologic periods than to the present.

LANCELOT OF THE LAKE, one of the heroes of the legendary story of King Arthur and the Round Table. See **ARTHUR**.

LANCERS, a description of cavalry soldiers who are armed with lances. The type and perfection of lancers are the Russian Cossacks, whose long lances enable them to combat with enemies at a distance from which they themselves take little harm. The lancers were brought into European notice by Napoleon, who greatly relied upon some Polish regiments. After the peace of 1815, the arm was adopted in the English service, but it is thought by many that the British lancer has a weapon too short to enable him to charge an infantry square with any chance of success. The regiments armed as lancers are enumerated in the article **CAVALRY**.

LANCET-WINDOW, a narrow window with acutely-pointed arch head. This form was much used in England and Scotland during the early pointed period of Gothic architecture. Several lancet-windows are frequently grouped together, as

Lancet-Window:
From Glasgow Cathedral.

as to produce a pleasing effect. In Scotland, the lancet-window was, like many other features of Scotch Gothic, retained to a much later period than in England. The fig. shows the east window of Glasgow Cathedral, which consists of four lancet-windows grouped together.

LANCEWOOD, a wood valuable for its great strength and elasticity. It is produced by the small tree *Guatteria virgata* (natural order *Anonaceæ*). Another species, *G. laurifolia*, yields the wood called White Lancewood. The latter is not much used. L. is of great value to coach-builders, by whom it is used for shafts and carriage-poles, for which it is especially fitted. The part used is the main trunk of the tree, which is very straight, and rarely more than nine inches in diameter, with the bark on. It comes in small quantities from the West Indies, chiefly, however, from Jamaica.

LANCIANO (the *Arx* or *Arx* of Pliny, subsequently *Arconum*), the capital of a district in the Neapolitan province of Abruzzo Citra, is situated 6 miles from the Adriatic, and 16 from Chieti. Pop. 14,500. Its present site occupies three hills, of which the two most adjacent are connected by an ancient bridge of great square blocks of stone, originally dedicated to Diocletian. The central position of this town favoured its being selected as a centre of judicial and civil administration during both the Roman and Gothic periods, and from its extensive traffic, it obtained the title of 'The Emporium of the Frentani.' L. possesses a fine cathedral, adorned with marbles and valuable paintings; contains several large foundries, and carries on manufactures of linen goods and farinaceous pastes.

LAND, TITLES TO. See **TITLE**.

LANDAU, a town of Rhenish Bavaria, and a fortress of the Germanic Confederation, is situated in a beautiful district on the Queich, which fills its fosse with water, twenty miles north-west of Carlsruhe. There are here important manufactures of tobacco. Pop., exclusive of the garrison, 7200. L. has been the scene of important events during every great war since the 15th century. In the Thirty Years' War, it was taken eight times by Swedes, Spaniards, Imperialists, and French. In 1684, it was fortified by Vauban, and was considered

impregnable until taken, in 1702, by the imperialists under the Markgraf Ludwig of Baden.

LAND-CRAB, the popular name of all those species of Crab (q. v.) which in a mature state are not aquatic. They are now erected into a family or tribe, and divided into several genera. The species are numerous, and all inhabitants of warm countries. They very much resemble the common crabs of our shores, and are remarkable as animals breathing by gills, and yet not aquatic, some of them inhabiting very dry places, where they burrow in the sand or earth; but such presence of moisture is absolutely necessary to them as to prevent the desiccation of their gills. Many, and probably all of them, deposit their spawn in water, for which purpose some of them annually migrate from considerable distances to the sea; but there is reason to suppose that some

Land-Crab (*Gelasimus masticus*).

deposit their spawn in fresh water. The **BLACK CRAB**, or **MOUNTAIN CRAB** (*Gecarcinus ruricola*), of the West Indies, usually resides in woods and on hills at a distance of at least one mile, often two or three miles from the sea, which, however, it regularly visits in the months of April and May, when immense numbers may be seen journeying together, moving straight on, unless obstacles quite insuperable impede their progress. Like most of the other species, this L. is active chiefly during the night; and except in rainy weather, it seldom leaves its burrow by day. It feeds chiefly on vegetable food. When in season, it is highly esteemed for the table, as some of the other land-crabs also are; and its spawn or roe, which before being deposited forms a bunch as large as a hen's egg, is accounted a delicacy.—A L. of Ceylon (*Ocypode*) is so troublesome on account of the burrows which it makes in the dry soil of the equestrian promenade at Colombo, that men are kept in regular employment to fill them up.—The grass-lands of some parts of India swarm with small land-crabs, which feed on the grass or on green stalks of rice.

LANDED MEN, JURY OF. In Scotch Law, it is a privilege belonging to a landed proprietor, when tried for a criminal offence, to demand a jury the majority of whom are landed proprietors.

LANDED PROPERTY is not a legal, but rather a popular phrase, to denote that kind of property which consists of freehold estates in land, or, in Scotland, heritable estates. A person may have a mere chattel interest in land, such as a lease (though in Scotland even that is heritable estate), and the landed property does not in such case belong to him, but to his landlord, to whom and whose heirs the land descends for ever, until alienated. Landed property includes houses and all things called corporeal, and also some incorporeal rights connected with land.

The various ways in which this important kind of property is held, and the formalities attending its transfer, are treated of under such heads as ALLodium, Fee, Freehold, Copyhold, Feoffment, Deed, Feu, Sasine, Charter, Conveyance, Conveyancing, Sale, Title, &c.

LANDER, RICHARD, the discoverer of the mouth of the Niger, was born in Cornwall in 1804, and became a printer; but in 1825 went with Captain Clapperton, as his servant, to Africa, and accompanied him from the Bay of Benin to Sokoto. There Clapperton died; and L., returning to England, published a journal containing an account of the expedition, giving proof of such qualifications, that the British government intrusted to him the prosecution of further researches concerning the course of the Niger. In 1830, he and his brother John succeeded in proving that the Quorra, or Niger, falls by many mouths into the Bight of Benin. The brothers were, however, seized by the negroes, and sold to a slave-dealer, but being brought to Cape Formosa, were redeemed by the master of a Liverpool ship. They returned to England in June 1830, and published a *Journal of an Expedition to Explore the Course and Termination of the Niger* (3 vols. Lond. 1832). In 1832, they undertook a new expedition to the Niger in an iron steam-boat, and bought a small island as a British trading-station. In 1833, Richard L., with a few companions, made a trading excursion in the delta of the Niger; but they were assailed by the natives, and L. received a wound, of which he died, at Fernando Po, 27th January 1834.—JOHN L., who was about three years younger than his brother Richard, was rewarded with an appointment in the Customs; but died, 16th November 1839, from the effects of the African climate.

LANDES (Fr. heaths), extensive tracts on the coast of the Bay of Biscay, between the Gironde and the Pyrenees. Few districts in Europe are more desolate and unproductive. The part nearest the sea is more so than that which lies further inland on the rivers Adour and Midouze. The soil is in general sandy, sometimes marshy, mostly covered with nothing better than heath and dwarf shrubs, except where large plantations of fir and cork trees were made in 1789, by direction of the minister Necker. Only a few more fertile spots yield crops of rye, maize, and millet. The inhabitants, who are called *Parens*, live in scattered villages of wretched huts, in the eastern part of the L.: they are of Gascon race, very poor and rude, but active, good-natured, and hospitable. They very generally walk on stilts in the marshy and sandy grounds. They keep bees, swine, and sheep, and also live by fishing and hunting; and have begun to derive much advantage from the plantations, in which they find occupation in charcoal-burning, cork-cutting, and collecting turpentine, resin, and pitch. They also manufacture *sabots*, or wooden shoes. The sheep of the L. are of a very wretched breed, with coarse wool.

LANDES, a maritime department of France, and one of the largest and most thinly peopled in the country, is bounded on the W. by the Bay of Biscay. Area, 2,434,752 acres; pop. (1862) 300,839. The principal river is the Adour. The railway from Bordeaux to Bayonne passes through the whole length of the province from north to south. Of the entire area of the department, 51,100 acres are in vineyards, and about 10,000,000 gallons of wine are produced annually. The department is divided into the three arrondissements, Mont-de-Marsan, St Sever, and Dax. Capital, Mont-de-Marsan.

LANDGRAVE, or LANDGRAF. See GRAF.

LANDLORD AND TENANT. The contract by which the owner of land or houses, or the party entitled to the exclusive possession thereof, lets or hires this exclusive possession to another for a limited time, is generally called a lease, and thereby the relation of landlord and tenant is created. The party letting is called the landlord or lessor, and the party taking the lease is called the lessee or tenant. In order to let a house, the contract need not be in writing, unless the property is let for more than three years; but writing is always useful, especially if any variation is made from the usual terms. In Scotland a verbal lease is good only for one year. If nothing is said as to details beyond the amount of rent, and the length of time the lease is to last, there are certain rights understood to exist as between landlord and tenant, of which the most important are as follows in England. The tenant has a right to assign or sublet the property, if not otherwise agreed, but he still remains bound for the rent, unless the landlord accept the sub-tenant in his place. As a general rule, the tenant is primarily liable to bear all public impositions, whether they be parliamentary taxes or poor-rates, paving, lighting, watching, water-rates, highway-rates, county or borough rates, and church-rates. Hence, if the tenant wishes the landlord to pay these, or any of them, he must make some special agreement to that effect, for the only two rates which the landlord is bound to pay, or rather, to repay to the tenant, are the land-tax and property-tax, and the sewers-rate. As regards repairs, the burden of repairs is, at common law, thrown on the tenant; and therefore, if the landlord is to repair, he must bind himself by express contract. But the tenant is only bound for ordinary repairs, not for repairs to the fabric itself. He is bound to use the premises in a fair and reasonable manner, and to give them up at the end of the term in much the same condition, making allowance for tear and wear, and the effects of time. Strange to say, the landlord does not impliedly warrant the house to be reasonably fit for habitation, or that it will last during the existence of the lease; and it has been held that a house infested with bugs could not be thrown up by the tenant merely on that ground. Moreover, if the landlord agree to do repairs, and fail to do them, the tenant is not entitled to quit on that account, unless there is an express agreement to that effect. Where the premises consist of a farm, the tenant is bound to repair the fences; and when a tenant makes great improvements on a farm, he has no claim against the landlord for the value of such improvements, if no express agreement has been made. This state of the law, which exists also in Ireland, has given rise to constant disputes there. As regards game, the tenant has a right to shoot the game, if he has a game licence, unless he has otherwise specially agreed. The tenant of a farm has no right to the mines of coal or other mineral, unless they are already open, in which case he may take them for his own use. If nothing is specially agreed as to the time of payment of the rent, it is only due at the end of each year, but there is usually an express agreement to pay quarterly at the end of each quarter. Such quarter-days are Lady-day, March 25; Midsummer-day, June 24; Michaelmas-day, September 29; and Christmas-day, December 25. Rent is sometimes agreed to be paid in advance, but there must be an express agreement to that effect. In case of fire, if nothing has been expressly agreed, the tenant is bound to go on paying rent as if the house actually existed; and yet there is no means of compelling the landlord to rebuild the house, and it is not even expressly settled whether in that case the tenant can get quit of his lease by

offering to abandon it. A landlord is privileged above all other creditors as to the way in which he recovers his rent, for he need not, like other creditors, go to the expense and delay of bringing an action, but he can make a distress on the premises, i.e., seize at once as much furniture or goods as he finds there, to pay the rent in arrear; and he can recover six years' rent in this way. And it is immaterial whether the goods so seized belong to the tenant or not; it is enough for the landlord's purpose that they are found on the premises. Hence, though the house is sublet to another tenant whose goods are there, or even if the furniture is hired, and though the landlord knew this, yet he may seize it and pay himself; the only exception being made in favour of trade, as where the goods have been sent to a tailor or weaver to be made up. This privilege of distress, however, though most valuable to the landlord, is subject to this qualification: it cannot be resorted to till after the rent is due. Hence, if the tenant is bound only to pay his rent at the end of the year, he may on the last day remove all his goods and furniture, and so put them beyond the reach of the landlord's distress. It is true he does not get quit of the debt, for the landlord may then sue him, like other creditors, but he has no privilege. On the other hand, though the landlord cannot distrain till after the rent is due, still it may happen that, even after rent is due, the tenant may yet manage to clandestinely remove the goods, the rule being, at common law, that if once the goods be taken off the premises, the landlord's security is gone. In such cases, the landlord is entitled by an express statute to follow the goods so fraudulently removed to avoid a distress, provided he do so within thirty days; and he can then seize them, in whose hands soever they may be, and distrain them, as if they were still on his premises. Another qualification of the landlord's right of distress is of some importance: he cannot break open the outer-door of the house, or force his way in, though he may use stratagem to get in peaceably, and when once in, he can effect his purpose by seizing a table in name of the other goods, and leaving his broker or bailiff in possession. It is generally the bailiff or agent of the landlord who makes the distress, but it is the same thing. Hence, it often happens that a tenant who is vigilant, and not to be surprised, may for a long time effectually keep his landlord at bay, as far as the power of distress is concerned, for his house is his castle to this extent. Another advantage a landlord has as a creditor is, that if his tenant is indebted to third parties, who obtain judgment against such tenant, and put an execution in the house, i.e., seize, under the authority of the judgment, the tenant's goods, or if the tenant become bankrupt, the landlord is entitled to be first paid out of the proceeds of the furniture or goods, one year's rent if in arrear; if there is more rent due, then he must take the same remedy as other creditors. The mode of terminating a lease is by the time expiring, or by a notice to quit. In the ordinary tenancies of houses, which are called tenancies from year to year, the rule is, if nothing is agreed to the contrary, that either party can put an end to the tenancy by giving a half-year's notice at such a time that the lease will end at the same time of the year as the tenancy commenced. Thus, if the tenant entered on 1st May 1863, then he can give a half-year's notice to quit on 1st May 1864, 1865, or any subsequent year. Sometimes the parties agree that only a quarter's notice will suffice, and that at any of the usual quarter-days of the year. Sometimes the tenant, after giving or receiving notice, refuses to remove, and holds over; in which case, if the land-

lord chooses, he may accept him, and thereby the tenancy is renewed from year to year; or he may insist on the notice, in which case he requires to bring an action of ejectment to turn the tenant out; and in such cases, the landlord is entitled to demand double rent or double value, until he gets back the possession. A lodger is in much the same position as a tenant to the party from whom he hires the lodgings. See *LODGINGS*.

In Scotland, the law on the subject of landlord and tenant differs in a great variety of details from the law of England as above stated, but it will be necessary only to notice the leading points. There is no implied right in the tenant to assign and sublet an ordinary lease of an agricultural subject, such as a farm; but sub-letting and assigning are implied rights of the tenant of an urban property. If a tenant take a farm or house, he is impliedly bound to stock the one and furnish the other. If a house is let, the landlord impliedly warrants that it is in a fit state of repair; and if the landlord is bound to repair, the tenant may either do the repairs at the landlord's expense, or retain the rent till the repairs are done. Usually, the landlord puts the farm buildings, fences, roadways, &c., in thorough repair at entry of the tenant, who is bound to leave the whole, at the end of the lease, in good condition, except as regards deterioration from ordinary wear and tear; by which arrangement all disputes, such as occur in Ireland, are avoided. The tenant has no claim for improvements, unless when his lease is abruptly terminated, and this is of rare occurrence. See *LEASE*. The tenant of a farm is, in the absence of special agreement, not entitled to the game. Rent is payable twice a year, if not otherwise agreed. In case of accidental fire, the tenant is no longer bound to pay rent if the destruction is complete, and otherwise is bound only *pro tanto*. A landlord has a hypothec, and can sequester (resembling the power of distress in England) the tenant's goods for rent which is current but not yet due. But the landlord cannot in general sequester a stranger's goods, unless in town-houses, and even then subject to qualification; and he cannot take a sub-tenant's goods, if the sub-tenant has paid the rent to the tenant. The landlord's hypothec or security over the goods follows the goods wherever they go, unless in the case of crops of a farm, when sold in bulk in public market; but this right must be exercised within three months after the term when the rent was due. The notice to quit, or warning, is sufficient if given forty days before the term of removal. But in Edinburgh the local custom is to give a three months' warning at Candlemas. Rent cannot be retained for an illiquid or unconstituted claim. If no notice is given forty days before the termination of a lease that advantage is to be taken of its close, the agreement is held to be renewed for another year by tacit relocation. See *Paterson's Compendium of English and Scotch Law*, pp. 127—149.

LANDLORD'S HYPOTHEC, in Scotch Law, means the lien or security for the landlord's rent which attaches upon the tenant's goods. See *LANDLORD AND TENANT*.

LONDON, LETITIA ELIZABETH, an English poetess—better known by her initials L. E. L.—was born in London in 1802. Her childhood was spent in the house of a relative in Hertfordshire. In 1820, her first poems appeared in the *Literary Gazette*, and attracted considerable attention. On the death of her father, she devoted her entire attention to literature, earning both fame and money. She published several volumes of verse, the most

widely read and admired of which was the *Improvisatrice*, and three novels, which have long since been deserted by the world of readers. On the 7th of June 1838, she married George Maclean, Esquire, Governor of Cape Coast Castle, and was found dead in her new house on the 15th October 1839. It is understood that for the alleviation of spasms, with which she was occasionally visited, she was in the habit of taking small doses of prussic acid, and her death is supposed to have been caused by an overdose. There is no reason to suppose that her death was other than accidental. In 1841, Mr Laman Blanchard published her *Life and Literary Remains*, in 2 vols.

L. E. L. might be called a sort of female Byron, if Byron had written nothing but the *Corcoran* and *Lara*. Her poems are altogether high flown and romantic, but they have a certain musical impulse which is pleasing, and which gave them all the charm they ever possessed.

LANDOR, WALTER SAVAGE, son of Walter Landor and of Elizabeth Savage, was born at Ipeley Court, Warwickshire, in 1776. He was educated at Rugby, and at Trinity College, Oxford, quitting the university without taking a degree. He succeeded to the family estates on the death of his father. In 1808, he raised a body of men at his own expense, and joined the Spanish patriots under Blake. He was made a colonel in the service of Spain, but resigned his commission on the restoration of King Ferdinand. In 1811, he married Miss Julia Thwaites of Bath. After his marriage, he resided first at Tours, then at Florence, where he bought an estate. He first became known as the author of *Count Julian*, which was followed by a poem called *Gebir*. In 1820, appeared *Idyllia Heroica* (in Latin), and in 1824—1829, his *Imaginary Conversations of Literary Men and Statesmen* (5 vols.). L. is a thorough classical scholar, and his Greek and Roman characters speak as we should expect the ancient heroes to have spoken. He is greater as a prose writer than as a poet; but, according to Emerson, who visited him in 1833, nature meant him rather for action than for literature. 'He has,' says Emerson, 'an English appetite for action and heroes.' In 1836, he published *Letters of a Conservative*; in the same year, a *Satire on Satiates, and Admonition to Detractors*; in 1837, *The Pentameron and Pentologue*; in 1847, *The Hellenica*; in 1848, *Imaginary Conversations of King Carlo Alberto and the Duchess Belgioioso on the Affairs and Prospects of Italy*; in 1851, *Popery, British and Foreign*; in 1863, *Last Fruit off an Old Tree*; in 1854, *Letters of an American*. Some more recent productions of L.'s pen are not considered to have added to his reputation. He resides at present (1863) abroad.

LANDOUR, a sanitary station in British India, on the south border of the protected state of Gurhwal (q. v.), at an elevation of 7579 feet above the sea. On ascending to this point from the plains, the thermometer has been known to fall from 90° to 52° F. in the course of two or three hours. Even in June, the temperature rarely rises to 80°; while, in January, it averages only about 53°. Much has been done to render the place available for invalids. Barracks have been erected, as also a post-office, a church, a hospital, a hotel, a library, and many private houses. L. is 1028 miles to the north-west of Calcutta. This sanitary station is all the more accessible from its proximity to both the great rivers of the neighbourhood, the Jumna and the Ganges.

LAND-RAIL. See CRAKE.

LANDRAILS, in point of law, are protected by the game-laws from illegal trespassers, though not included in the definition of 'game.' See GAME, POACHERS.

LANDSBERG, a town of Prussia, in the province of Brandenburg, is situated in a pleasant and fruitful district on the Warthe, 40 miles north-east of Frankfurt. Its corn and wool markets are important; weaving, tanning, distilling, and machine-making are carried on. Pop. 13,495.

LANDSCAPE-GARDENING, the art of laying out grounds in order to beauty and pleasure, which may fairly claim to be reckoned among the fine arts. It is chiefly practised either in connection with the residences of the opulent, or in the public parks and pleasure-grounds of cities. The happiest results are indeed obtained, where the mere purpose of pleasing is not too much obtruded on attention, but where it is seen to harmonise with some other design.

Where the general aspect of a country is wild, and has been little modified by cultivation, enclosures, and other works of man, those scenes are felt to be most pleasing which exhibit his progress and triumph. Thus, when pleasure-grounds first began to be laid out, they exhibited only geometric forms; and alleys, avenues, and parterres did not seem artificial enough to give delight, without buildings of various kinds, terraces, mounds, artificial hills, lakes, and streams, close-clipped hedges, and trees or shrubs trimmed by *topiarian* art into fantastic shapes, such as figures of animals, vases, and the like. The art of the *topiarius* or *pleacher*—dating from the Augustan age in Rome—is now no longer in repute. In districts where the general scene exhibits a succession of rectangular fields, and where everything has evidently been reduced to a condition subservient to utility, a greater irregularity gives pleasure, and the eye loves to rest on any portion of the landscape which seems to exhibit the original beauties of nature. The landscape-gardener, however, must not attempt an exact imitation of nature, or to reduce everything to a state of primitive wildness. Like the painter, he must seek to exhibit nature idealised. The introduction of water is seldom successful; the mere landscape-gardener's lake or cascade is too obviously artificial. Where water is within view, it is a chief object of the landscape-gardener to arrange everything so that the view of it may be enjoyed from the windows of the mansion, or from the principal walks. Much care is given to the disposal of wood, in masses, groups, and single trees. Belts and clumps, which were much in vogue in the latter part of the 18th c., are now comparatively seldom planted.

The style of landscape-gardening in which regular forms prevail is called the *Geometric*; and the opposite style, from having been first extensively practised in England, in which country, indeed, it may be said to have originated, is known as the *English*. On the continent of Europe, a pleasure-ground laid out with winding and irregular walks, and scattered trees or groups of trees and shrubs, is called an *English garden*. But many of the continental English gardens are rather caricatures of the true English style than illustrations of it.

The taste of the present age rejects the grottoes, temples, statues, monuments, fountains, *jets-d'eau*, &c., with which it was once the fashion to fill pleasure-grounds, or admits only of their sparing introduction.

In the laying out of grounds, whether on a large or a small scale, it is of great importance that the trees and shrubs be well chosen, and the different kinds well grouped.

LANDS-CLAUSES ACT, a statute passed in

1845, containing a code of regulations generally inserted in all local acts where a power is given to take compulsorily a man's land for the purposes of public improvements. As no man can be compelled otherwise to sell his property, a statutory power to compel him is necessary in all cases where a public undertaking, such as a railway, harbour, &c., requires it. A statute, 8 Vict. c. 18, accordingly, with the above title, was passed for England, and 8 Vict. c. 19 for Scotland, each containing detailed provisions as to the mode of settling the price to be given in such cases, &c.

LANDSEER, SIR EDWIN, R.A., an English painter, son of John Landseer, an eminent engraver, was born in London in 1802, and was carefully trained by his father, who used to take him out, when only a child, to Hampstead Heath, and accustom him to sketch animals from life. The first work of L.'s that brought him prominently before the public was 'Dogs Fighting,' exhibited in 1819. It was succeeded by the 'Dogs of St Gothard' (1819), the popularity of which was very great. The scene of several of his finest pictures is laid in the Highlands of Scotland. For upwards of thirty years, every London exhibition has witnessed his success. In 1827 he was elected a R.A., and in 1850 he was knighted. Among his most celebrated achievements are: 'The Return from Deer-stalking,' 'The Illicit Whisky-still,' 'Highland Music,' 'Poachers Deer-stalking,' 'Bolton Abbey in the Olden Time,' 'A Scene in the Grampians—the Drover's Departure,' 'Return from Hawking,' 'The Old Shepherd's Chief Mourner,' 'Peace,' 'War,' 'Stag at Bay,' 'The Drive—Shooting Deer on the Pass,' 'The Random Shot,' 'Night,' 'Morning,' 'The Children of the Mist,' 'Saved,' 'Highland Nurses—Dedicated to Miss Nightingale,' 'Deer-stalking,' and 'Flood in the Highlands' (1861). L. is reckoned the most superb animal-painter of his time; his conceptions are often highly poetical; the sentiment which he throws into his representations of the 'dumb creatures' is quite wonderful, and the felicity of his execution is unsurpassed. Most, if not all his pictures have been engraved.—L. has two brothers, CHARLES and THOMAS, also artists. Thomas is one of the best living engravers in England.

LAND'S END. See CORNWALL.

LANDSHUT, an ancient and picturesque German town, capital of Lower Bavaria, is situated in a pleasant, fertile district on the Isar, 39 miles north-east of Munich. Its streets are rich in quaint old gables, and there are numerous towers; that of St Martin's Church (a Gothic building, dating from 1450) is 420 English feet in height. L. contains 36 breweries, and has manufactures of woollen cloth, leather, hosiery, and tobacco. In 1826, the university, which was removed hither from Ingolstadt in 1800, was transferred to Munich. The castle of Trausnitz, long the residence of the Dukes of Bavaria, is supposed to have been originally a Roman station. During the Thirty Years' War, and the war of the Austrian Succession, L. was an important fortress, and the scene of many conflicts. Pop. 11,316.

LANDSLIPS, large portions of land which from some cause have become detached from their original position, and slid down to a lower level. They are especially common in volcanic districts, where the trembling of the earth that frequently accompanies the eruption of a volcano is sufficient to split off large portions of mountains, which slide down to the plains below. Water is another great agent in producing landslips. It operates in various ways. The most common method is when water insinuates itself into minute cracks, which are widened and deepened by its freezing in winter. When the

fissure becomes sufficiently deep, on the melting of the ice, a landlip is produced. Sometimes, when the strata are very much inclined, and rest on a bed susceptible of absorbing water, and becoming slippery, the superincumbent mass slides over it to a lower level. This took place on a large scale in Dorsetshire between Lyme and Axminster in 1839, an unusually wet season, in which the strata had become saturated with moisture. A mass of chalk and greensand here slid over the slippery surface of a bed of liassic clay down into the sea, leaving a rent three-quarters of a mile long, 240 feet wide, and 150 feet deep. Of the same kind was the slip of the Rossberg, in Switzerland (see GOLDAU). Landslips of a different kind have been produced in peat-mosses, which becoming by heavy rains thoroughly saturated with water, have burst their natural boundaries, and discharged themselves on a lower level. The most remarkable case on record is that of the Solway Moss, which, in 1772, owing to greater rains than had fallen for nearly two centuries, spread itself in a slowly rolling, resistless deluge of black mud over 400 acres of cultivated fields, and to such a depth as almost to cover several houses, while it reached the roof of others.

LANDSMAN, a term applied on board ship to a sailor who has never been at sea before. The word is gradually becoming obsolete, and is supplied in the royal navy by the expression 'ordinary seaman of the 2d class.'

LAND-SURVEYING, or the measurement of the area of a portion, whether small or large, of the earth's surface, is an important application of mathematics, and involves a thorough acquaintance with geometry, trigonometry, and the theory and use of the instruments employed for the determination of angles. Fields or portions of ground of small extent are measured easily and with sufficient accuracy by a chain (for distances), and a box-compass or cross-staff (for angles). For larger areas, the use of the surveyor's table is requisite; and for those of still greater extent, in which the greatest accuracy is requisite in the determination of the angles, the astrolabe, theodolite, sextant, circle, reflector, micrometer, &c., are used. The surface to be measured is divided into triangles, which are separately measured and calculated; but when a large extent is included in the measurement, it is not enough to proceed from one triangle to another, in which way an error at the outset may be propagated with continual increase; but a base line, as long as circumstances admit of, must, in the first instance, be accurately measured, upon which, by means of the measurement of angles, all the subsequent calculations are made to depend, and lines subsequently measured are only intended to be corrective of the results obtained by calculation. When the extent of surface is still greater, as when a whole country is to be measured, points here and there are astronomically determined, their meridians are accurately laid down, and a complicated system of triangles is employed to insure accuracy. This is called *Triangulation*.

LAND-TAX, a tax imposed upon land and houses for purposes of revenue, in lieu of the ancient subsidies, scutages, tallages, tenths, fifteenths, and such occasional taxes. From a very early period to the middle of the 17th c., parliament had provided for the extraordinary necessities of the government chiefly by granting subsidies, which were raised by an impost on the people in respect of their reputed estates. Landed property was the chief subject of taxation, and was assessed nominally at 4s. in the pound. But this assessment was made in such a way that it did not rise with the value

of land, but dwindled away to about 2d. in the pound. The Long Parliament devised a more efficient plan by fixing the sum to be raised, and then distributing it among counties according to their supposed wealth, leaving them to raise it by a rate. In 1692, a new valuation of lands was made, and it was found that a tax of 1s. per pound would yield half a million. In war, this was raised to 4s. In 1798, the parliament relieved itself of the trouble of every year passing an act, and a general act was passed, permanently fixing the land-tax at 4s. in the pound. This act (38 Geo. III. c. 60) enabled the landlord to redeem the tax, and accordingly, since that time, a great part of it has been redeemed, only about one million being unredeemed. Though the act of 1798 directed the tax to be assessed and collected with impartiality, this provision was not carried out, but the old valuation of 1698 was acted on, and in modern times the greatest possible inequality prevails. If the tax is in arrear, the tenant is liable to a distress; but the tenant may deduct it from the next rent he pays. The tax, though nominally chargeable on the landlord, falls neither on the landlord nor the tenant, but on the beneficial proprietor, as distinguished from the tenant at rack-rent; for if the tenant has sublet, and has a beneficial interest, he pays *pro tanto* the tax, charging the residue on the landlord. The proportion of land-tax fixed on Scotland was £47,954, and a proportion was fixed on each county, the commissioners having power to amend the valuation. The collection and management of the tax was given to the commissioners of taxes by the statute 3 and 4 Will. IV. c. 13.

LAND-TRANSPORT CORPS. See **MILITARY TRAIN.**

LANDWEHR (Land-defence), a military force in several of the German states, somewhat corresponding to the Militia (q. v.) of Great Britain. It is not always retained under arms. During peace, its members spend most of their time in civil pursuits, and are called out for military service only in times of war or of commotion—care being taken however, that they are sufficiently exercised to make them ready for such service when necessary. The name Landwehr was first applied to the Tyrolese, who rose against the French; and in 1805 a similar force was raised in the other German provinces of Austria, which, however, the emperor has recently abolished. By far the most elaborate and complete system of land-defence is the Prussian, which was called into existence in 1813, when all Germany rose against Napoleon. As early, indeed, as 1806, or earlier, Marshal Kneesebeck, then a major in the Prussian army, had proposed such a thing; but it was not till the opening of the campaign of 1813 that the Prussian Landwehr was organised according to Scharnhorst's plan by a royal edict, dated 17th March. At first, it was designed solely as a land defence, properly so called, and not, what is now the case, as an integral part of the regular army. It was called out in two separate levies, the first comprising all men from 26 to 32, and the second those from 32 to 39. The old men up to 60 belonged to the *Landsturm*, which was called out only for the defence of house and hearth.

After the second Peace of Paris appeared the *Landwehrordnung* (Landwehr-regulation) of 21st April 1815, according to which the country was divided into 104 districts, each of which had to furnish a battalion of Landwehr. To every battalion of Landwehr was attached a squadron of ulans; three battalions formed a regiment; two regiments, a Landwehr brigade, which, along with the brigades of cavalry and infantry, was placed

under a general of division. More recently, the Landwehr was brought into closer union with the line, in order to remedy the faults which had shewn themselves, in spite of all the admirableness of the system. Landwehr brigades have been introduced into the regular army.

LANFRANC, the most eminent of the foreign churchmen who rose to distinction in the mediaeval Church of England, was born of a noble family at Pavia, in 1005, and educated, partly at Pavia, partly at Bologna, for the profession of the law. For a time he followed the profession of an advocate at Pavia; but in the hope of greater distinction, he removed to France, and founded at Avranches a school of law, which soon became one of the most popular in France. Having been waylaid and all but murdered by robbers during one of his journeys to Rouen, he was carried to the monastery of Bec, where he was treated with much tenderness; and the deep religious impressions there received determined him to abandon the world and become himself a monk. He was soon (1041) chosen prior of the monastery; and his reputation for piety, as well as the fame for theological learning which he acquired, especially in his controversy on the Eucharist with Berengar, led to his translation in 1062 to the still more important monastery of St Stephen, at Caen, recently founded by William, Duke of Normandy. Having enjoyed the confidence of that prince for many years, he was selected by him, after the conquest of England, to fill the primatial see of Canterbury, and he was induced with much reluctance to accept it in 1070. Having once, however, undertaken the charge, he entered zealously into the policy of his sovereign; and under his spiritual rule the Church of England received as strong an infusion of the Norman element as was forced upon the political system of England by the iron hand of the Conqueror. L. outlived William; and to his influence the historians mainly ascribe the peaceful submission with which that monarch's successor, Rufus, was accepted by the kingdom, as well as the comparative moderation of the earlier years of Rufus's reign. The tyranny which has made the name of Rufus odious dates mainly after the death of L., which occurred in 1089, in the 84th year of his age. His chief writings are—Commentaries on the Epistles of St Paul, the Treatise against Berengar, and Sermons. His letters, however, are very interesting. The first complete edition of his works is that of D'Achery (fol. Paris, 1648). They are also found in the *Bibliotheca Patrum*. See Milman's *Latin Christianity*, vol. iii. pp. 438—440, and also Dr Hook's *Lives of the Archbishops of Canterbury*, vol. ii. 1861.

LANGÉLAND (i. e., *long land*), a Danish island, situated at the southern entrance to the Great Belt, between Fuhnen and Laaland. It is 33 miles in length, and about 3 miles in average breadth. Area, about 100 square miles; pop. 17,400. It consists of a ridge of low hills, is very fertile in soil, and is well wooded. Grain, pease, butter, and cheese are largely produced. Rudkjøbing, pop. 2000, on the west coast, is the only town.

LANGENBIE'LAU, a succession of small contiguous villages in Prussia, in the province of Silesia, 33 miles south-west of Breslau. Entire pop. 12,667, who are employed in linen, cotton, and other manufactures, and in sugar-refining and dyeing.

LANGENSALZA, a manufacturing town of Prussian Saxony, on the Salza, 20 miles north-west of Erfurt. It contains an old castle, and is surrounded by walls. Manufactures of silks, linens, and woollens are carried on. About two miles from the town are a sulphur spring and baths.

LA'NGHOLM, a burgh of barony and market-town in Dumfriesshire, Scotland, at the junction of the Ewes, the Wauchope, and the Esk, about 30 miles east of the county town, and 8 miles north of the English border. There are 8 factories in the town, whose staple manufactures are woollen yarns, and a woollen cloth called Tweed, for which the town is noted. Dye-works are also in operation. L. consists of the united villages of Old and New Langholm. Pop. (1861) 2979.

LANGRES, a manufacturing town of France, in the department of Haute-Marne, is situated at an elevation of 1408 feet above sea-level, 20 miles south-east of Chaumont. Here cutlery of the finest quality is manufactured, and there is a considerable trade in grain, lint, cattle, and sheep. It is said to have been the see of a bishop since the 3d c., and possesses a cathedral of the 11th century. Pop. 10,850. L., the ancient Andematunum, was in the time of Cæsar the capital of the Lingones, a name corrupted into Langres.

LANGSAT, or **LANSEH**. See **MELIACÆ**.

LANGTON, **STEFEN**, celebrated in the history of the liberties of England, was born probably in Lincoln or Devonshire, in the early part of the 12th century. He received the chief part of his education in the university of Paris, where he was the fellow-student and friend of Innocent III.; and having completed his studies, he rose through successive grades to the office of chancellor of the university. After the elevation of Innocent, L., having visited Rome, was named to the cardinalate by the pope; and, on occasion of the disputed election to the see of Canterbury, he was recommended to those electors who had come to Rome on the appeal, and having been elected by them, was consecrated by Innocent himself at Viterbo, June 27, 1207. His appointment, nevertheless, was resisted by King John; and for six years, L. was excluded from the see, to which he was only admitted on the adjustment, in 1213, of the king's dispute with Innocent through the legate Pandulf. See **INNOCENT III.** This reconciliation, however, was but temporary. In the conflict of John with his barons, L. was a warm partisan of the latter, and his name is the first of the subscribing witnesses of Magna Charta. When the pope, acting on the representation of John, and espousing his cause as that of a vassal of the holy see, excommunicated the barons, L. refused to publish the excommunication, and was in consequence suspended from his functions in 1215. He was restored, however, probably in the following year; and on the accession of Henry III., he was reinstated (1218) in his see of Canterbury, from which time he chiefly occupied himself with church reforms till his death, which took place July 9, 1228. L. was a learned and successful writer, but his writings are lost, and the chief trace which he has left in sacred literature is the division of the Bible into chapters, which is ascribed to him. Giraldus Cambrensis (q. v.) dedicated several of his books to Langton.—See Wharton's *Anglia Sacra*, vol. i. and ii.; Lingard, vol. ii.; Milman's *Latin Christianity*, vol. iv.; and Dr Hook's *Lives of the Archbishops of Canterbury*, vol. ii. 1861.

LANGUAGE. See **PHILOLOGY**.

LA'NGUED, or **LAMPASSÉ**, in Heraldry. An animal whose tongue is of a different colour from his body, is said to be *langued* of that colour. It is understood in England that unless the blazon direct otherwise, all animals are langued gules whose tincture is not gules, and an animal gules is langued azure. This rule does not hold good in Scottish Heraldry, where, 'when the tongue, teeth, and claws are of different tinctures from their

bodies, they are to be mentioned as armed and langued of such a tincture.'—Niebet. When a beast or bird is represented without teeth or claws, this is expressed in blazon 'sans langue and arma.'

LANGUEDOC, the name given in the middle ages, and down to the French Revolution, to a province in the south of France, bounded on the N. by Auvergne and Lyonnais; on the E. by the river Rhone; on the S. by the Mediterranean and the counties of Foix and Roussillon; and on the W. by Gascony and Guienne. It was traversed through its whole length, from north-east to south-west, by the Cevennes (q. v.). L. is now divided into the departments of Lozère, Gard, Ardèche, Aude, Hérault, Upper Loire, Tarn, and Upper Garonne. The capital of L. was Toulouse. The name is derived from that of the southern French dialect, or Provençal, which was called the *langue d'oc*, whilst the northern was called *langue d'oïl* or *langue d'oïl*, because in the former the word *oc* (probably from the Teutonic *ouch*) was used for *yes*, and in the latter *oïl* or *oui* (Teut. *wald*).

LANI'ADÆ, a family of birds, generally ranked, as by Cuvier, in the order *Insectores*, sub-order *Dentirostres*, but allying them to *Accipitres*. They are the largest and most rapacious of the *Dentirostres*, preying on small birds, quadrupeds, and reptiles, as well as on large insects. Many of them have the curious habit of impaling their prey on thorns, after which they pull it in pieces, and devour it at leisure. They have a short, strong, abruptly hooked bill, with a notch or tooth on each side, and sharp claws. The Shrikes (q. v.), or Butcher-birds, are the type of the family; but it is united by numerous links to the family of the *Muscicapidae*, or Fly-catchers, and the limits of the two families are very uncertain.

LANKĀ, the ancient name of the capital of Ceylon. In Hindu mythology, it is renowned as the chief city of the giant Ravana (q. v.), who, by carrying off Sita, the wife of Rama, caused the conquest of Ceylon by the latter personage, who is considered as an incarnation of the god Vishnu.

LANKĀVATĀRA, the name of one of the chief religious works of the Buddhists. It treats of their religious law, and of some of their most abstruse philosophical problems. See E. Burnouf, &c., and W. Wastiljew, &c., as named under **LALITA-VISTARA**.

LANNER (*Falco lannarius*), a species of falcon,

Lanner (*Falco lannarius*).

much valued in the days of falconry for flying at the kite. The female only was called a L., in the

language of falconry; the male, being smaller, a *lanneret*.

LANNES, JEAN, DUKE OF MONTEBELLO, a marshal of the French Empire, was born 11th April 1760, at Lectoure; entered the army in 1792, and soon rose to high military rank. He rendered Napoleon important services on the 18th Brumaire, and enjoyed his highest favour. On 9th June 1800 he won the battle of Montebello, whence his title. He bore a principal share in the battle of Marengo, and commanded the left wing at Austerlitz. He served in the campaign against Prussia in 1806, commanded the centre at Jena, and distinguished himself at Eylau and Friedland. Being sent to Spain, he defeated General Castaños at Tudela, 22d November 1808, and took Saragossa. In 1809, he again served on the Danube, and commanded the centre at Aspern (the 22d May), where he had both his legs carried away by a cannon-shot. He was removed to Vienna, and died there, 31st May. He was interred in the Pantheon, in Paris.

LANNION, a town and river-port of France, in the department of Côtes-du-Nord, on the Guas, about seven miles from the mouth of that river. Its trade is chiefly in deals, Bordeaux wine, and colonial produce. Pop. about 6000.

LANDOWNE, HENRY PETTY-FITZMAURICE, third MARQUESS OF, an English statesman, was born at Lansdowne House, London, July 2, 1780. His father, the celebrated Earl of Shelburne, was premier to George III., and received the coronet of a marquis in 1784. L. (then Lord Henry Petty) was a younger son, and was sent to Westminster School, and afterwards to Edinburgh, then the school of the young Whigs destined for political life. He took his degree at Trinity College, Cambridge, in 1801, and when barely of age, entered parliament as M.P. for Calne. He turned his attention to finance; and on Pitt's death, he became, at the age of 25, Chancellor of the Exchequer, in the administration of Lord Grenville. In 1809, he succeeded his half-brother in the marquise, became one of the heads of the liberal party in the House of Lords, and during a long opposition, consistently advocated those various measures of progress which he lived to see triumphant. When the Whigs, after their long exclusion from power, came into office with Earl Grey at their head, L. became Lord President of the Council, which post he held, with a brief interval, from November 1830 to September 1841, resuming it in 1844, after the fall of the Peel ministry, and again filling it until 1852. He then formally bade farewell to office, and resigned the leadership of the House of Lords; but consented to hold a seat without office in the Aberdeen cabinet, and again in the first administration of Lord Palmerston. After the death of the Duke of Wellington, he became the patriarch of the Upper House, and the personal friend and adviser of the Queen. He had a keen relish and a cultivated taste for literature, and was the generous patron of men of letters. He formed a splendid library, and one of the noblest collections of pictures and statuary in the kingdom. He refused a dukedom, and might more than once have been prime minister. His death took place January 31, 1863, at Bowood.

LA'NSING, the capital of Michigan, U.S., on Grand River, 110 miles north-west of Detroit, contains a state-house, female college, state agricultural college, and model farm of 700 acres, house of correction for juvenile offenders, ten churches, a bank, two weekly papers, and several manufactories. Settled in 1847, it has a population of 5000.

LANTERN, in Architecture, an ornamental structure raised over domes, roofs, &c. to give light and ventilation. The dome of St Paul's Cathedral and many other large domes are crowned with a lantern. Where a lantern is for the purpose of giving light, it is called a *lantern-light*. In Gothic architecture, a *lantern-tower* is frequently placed over the centre of cross churches—the vault being at a considerable height, and the light admitted by windows in the sides. York and Ely cathedrals, and many churches in England, have such lantern-towers.

LANTERN-FLY (*Fulgora*), a genus of homopterous insects; the type of a family *Fulgorida*, allied to *Cicadidae*, but having legs more adapted for leaping, and destitute of organs for producing sound. The forehead is remarkably prolonged into an empty vesicular expansion, which assumes in the different species various and very singular forms, sometimes equalling the body of the insect in size. The colours are generally rich. The species are

Lantern-Fly (Fulgora lateralis).

native of the warmest parts of the world. The name L. was originally given to *F. lateralis*, a large species, found in Guiana, and of which the inflated projection of the forehead is said to be sometimes most brilliantly luminous; but the evidence is doubtful, and many naturalists refuse to believe in the luminosity of any of this genus. The most probable explanation is, that the luminosity is sexual, and merely occasional, perhaps limited to particular seasons. Concerning the luminosity of the *CHEWINK L.* (*F. candalaria*), there is still greater doubt. The prolongation of the forehead in this species is a comparatively narrow snout.

LANTHANUM, or **LANTHANUM**, so named from the Greek word *Lanthanein*, to lie hid, is a metal which was discovered by Mosander in 1841 in *Cerite* (q. v.), a hydrated silicate of cerium. It is of little chemical interest, and is of no practical value. Till recently, the three metals cerium, lanthanum, and didymium were all confounded together under the name cerium.

LA'NYARDS, in a ship, are short ropes used either to make fast various apparatus in its place, or to stretch other and important ropes to their utmost tension.

LANZAROTE, one of the Canaries (q. v.).

LANZI, LUIGI, a celebrated Italian antiquary, was born at Monte dell' Olmo, near Macerata, June 14, 1732. He entered the order of the Jesuits, and resided at Rome, and afterwards at Florence, where he died March 30, 1810. In 1782, he published at Florence his *Descrizione della Galleria di Firenze*. His great works, distinguished for their profound erudition, are his *Saggio di Lingua Etrusca* (3 vols. Rome, 1789), in which, contrary to the prevalent opinion among Italian savants, he maintains the influence of Greece upon Etruscan civilisation, and his *Storia Pittorica d'Italia*, &c. (Florence, 1792; and Bergamo, 1799, and 1806). This latter work

has been translated into English by Thomas Roscoe (Bohn's Standard Library, 3 vols. 1847). He is the author also of several poems, works on Etruscan vase, sculpture, &c. His posthumous works were published in 2 vols. at Florence in 1817.

LA'OCOÖN, according to classic legend, a priest either of Apollo or Neptune, in Troy, who in vain warned his countrymen of the deceit practised by the Greeks in their pretended offering of the wooden horse to Minerva, and was destroyed along with his two sons by two enormous serpents which came from the sea. They first fastened on his children, and when he attempted to rescue them, involved himself in their coils. This legend is not Homeric, but of later origin. It was, however, a favourite theme of the Greek poets, and is introduced in the *Æneid* of Virgil. It acquires a peculiar interest

ecclesiastical discipline. A second council was held here in 476, which condemned the Eutychians.

LAON, chief town of the department of Aisne, in France, is situated in a strong position on a steep isolated hill, 80 miles north-east of Paris. The walls (flanked with towers) with which it is surrounded, the noble Gothic cathedral (built 1112-1114) on the summit of the hill, and the charming character of the scenery in the vicinity, greatly enhance the appearance of the town. The public library, with 20,000 vols., contains also a beautiful statue in marble of Gabrielle d'Estrees. The manufactures are sails, hats, leather, and hosiery. Here, on March 9 and 10, 1814, Napoleon was defeated by the allies, and compelled to fall back on Soissons. Pop. 10,412.

LA'OS. See SHAN STATE.

LAOU-TSZE, a celebrated philosopher of China, the founder of a religion as ancient and important as that of Confucius (q. v.). This sect is commonly known as the *Tao*, or sect of reason. His family name was *Le*, or *Plum*, and his youthful name *Urñ*, or *Ear*—given him on account of the size of his ears. His name of honour was *Pe-yang*, his surname *Laou-tze* ('old child'), or *Laou-kuun-tes* ('old prince'), by which he is generally known. Little authentic is known of the life of L., his followers having subsequently made a myth of his biography. He was born in the third year of the Emperor Ting-wang, of the Chow dynasty (604 B.C.), in the state of *Tsu*, at present known as *Hoo-pih* and *Hoo-nan*, 54 years before Confucius. His father, according to the legends of the *Tao* sect, was 70 years before he married, and his mother 40 years of age when she conceived him. He was the incarnation of a shooting-star, a kind of god on earth, and was 80 years in his mother's womb. More trustworthy is the statement that he was a historian and archivist of a king of the Chow dynasty, who loved books, studied rites and history, and went, about 600 A.D., to the western parts of China, where he might have become acquainted with the worship of *Fuh* or *Buddha*. Confucius was so attracted by his renown, that he went to see him, but the meeting does not appear to have been entirely amicable, for L. reproached the sage with pride, vanity, and ostentation, stating that sages loved obscurity and retreat, studied time and circumstances before they spoke, and made no parade of knowledge and virtue. Confucius, however, highly lauded L. to his followers, and called him a dragon soaring to the clouds of heaven, which nothing could surpass. L. asked Confucius if he had discovered the *Tao* ('path' or 'reason') by which Heaven acts, when Confucius answered that he had searched for it without success. L. replied that the rich sent away their friends with presents, sages theirs with good advice, and that he humbly thought himself a sage. By this he probably meant that all he could offer Confucius was the advice of seeking the *Tao*. He retired to *Han-kwan*, where the magistrates of the place received him, and there he wrote the *Tao-ku-ling*, or Book of Reason and Virtue. He died, or, according to other accounts, mounted to heaven on a black buffalo, in the 21st year of the reign of King-wang of the Chow dynasty, 523 B.C., having attained the age of 119 years.

The doctrines of L. differ from those of Confucius, indeed, have a higher scope—the object of the last-named philosopher, or rather statesman, being the practical government of man through a code of morals; that of L., the rendering of man immortal through the contemplation of God, the repression of the passions, and the perfect tranquillity of the soul. Hence his doctrine was, that Silence and the

Laocoön.

from being the subject of one of the most famous works of ancient sculpture still in existence; a group discovered in 1506 at Rome, in the *Sette Sale*, on the side of the Esquiline Hill, and purchased by Pope Julius II. for the Vatican. It was carried to Paris, but recovered in 1814. The whole treatment of the subject, the anatomical accuracy of the figures, and the representation both of bodily pain and of passion, have always commanded the highest admiration. According to Pliny, it was the work of the Rhodian artists Agasander, Polydorus, and Athenodorus, but this is doubtful. Casts of it are to be found in every European museum. For an aesthetic exposition of its merits, see *Lamington's celebrated Laocoön oder über die Grenzen der Malerei und Poesie*.

LAODICEA, a city of ancient Phrygia, near the river Lycos, so called after Laodice, queen of Antiochus Theos, its founder, was built on the site of an older town named Diopolis. It was destroyed by an earthquake during the reign of Tiberius, but rebuilt by the inhabitants, who were very wealthy, fell into the hands of the Turks in 1256, was again destroyed in 1402, and is now a heap of uninteresting ruins, known by the name of *Eski-Hissar*. Art and science flourished among the ancient Laodiceans, and it was the seat of a famous medical school. The number of Jews who were settled here at the rise of Christianity will account for its importance in the primitive history of the church. An important ecclesiastical council, the First Council of Laodicea, was held here in 363, which adopted resolutions concerning the canon of the Old and New Testaments, and concerning

Void produced the Tao, the 'Logos' or reason by which movement was produced; and from these two sprung all beings which contained in themselves the dual principle of male and female. Man was composed of two principles, the one material, and the other spiritual, from which he emanated, and to which he ought to return, by throwing off the shackles of the body, annihilating the material passions, the inclinations of the soul, and pleasures of the body. By this means, the soul was to regain its origin—become immortal. This could only be effected by the renunciation of riches, honours, and the ties of life. Up to the period of *Li*, the national worship had been restricted to the *Shang-te*, or 'supreme ruler' of the world, and the *Tien*, or 'heaven.' For these, *Li* substituted the *Tao* ('path' or 'reason') of the cosmos, not citing, as the Confucianists, the precedents of ancient kings or sages—appealing to the abstract principle, and, in fact, preaching a religion which found an echo in the Chinese breast. The followers of his sect, however, considerably altered his doctrines. The moral code of the Taoist sect is excellent, inculcating all the great principles found in other religions—charity, benevolence, virtue, and the free-will, moral agency, and responsibility of man. But it subsequently became corrupted with strange doctrines and practices. They promulgated that they had discovered the drink of immortality, and obtained a host of partisans in the reign of Wan-te of the Han dynasty, 140 A.D., and many of the emperors were addicted to their rites, and some poisoned by the drink of immortality. Alchemy also became another pursuit of the sect; so did divination, the invocation of spirits, and the prediction of the future. The doctors of the sect, called *Tsen-ze* ('celestial doctors'), were supposed by these means to become ethereal, and to be caught up to heaven without passing through the intermediate state of death. Such statements, however, were ridiculed by the *Joo-teou*, or sect of Confucius, the sceptics of China, who openly derided their pretensions. Innumerable gods were also introduced into the worship, which was assimilated to the Buddhist. Since the 2d c. A.D., the sect has continued to spread in China, Japan, Cochin-China, Tonquin, and amongst the Indo-Chinese nations. Monasteries and nunneries belonging to them were founded and flourished. The principal books or classics of the sect are the *Tao-tih-king* already cited; the collections called *Tao-chang*; the *Kan-ying-keen*, or Book of Rewards and Punishments; and the *Tan-kwei-tai*, or List of the Scarlet Laurus Cassia.

Stanislas Julien, *Le Livre des Recompenses* (8vo, Paris, 1838); Panthier, *La Chine* (8vo, Paris, 1837, p. 114—117); Neumann, *Lehrbuch des Mittelalters* (8vo, Munich, 1856); Grosier, *Description de la Chine* (4to, p. 571); *Mémoires sur la Chine* (x. 425; xv. 208—259).

LAPIDARY-WORK, the art of cutting, grinding, and polishing small pieces of ornamental or precious stones for jewellery. (For the engraving of figures on precious stones, see CAMMO and GRMS.) The working of the less precious ornamental stones has made great strides within the last twenty or thirty years, and nowhere has it reached greater perfection than in Scotland. A large trade is now carried on in this kind of work between Birmingham and some towns of Germany, where the Scotch patterns are imitated; and although the foreign productions are of inferior workmanship, their comparative cheapness commands a ready market.

Stones are cut by rubbing the powder of a harder stone against a softer one. There are ten types of Hardness (q. v.), from talc up to diamond; but in practice it is found most convenient to employ either

diamond-powder or emery, which is next to it, for the cutting of all kinds of stones. Diamond-dust is found to cut ten times faster than emery; so that, except where the machine is driven by water-power, it is found more profitable to employ diamond-powder, notwithstanding its high price. Diamond-powder is prepared from the inferior kind of Diamonds (q. v.) called bort (costing about a guinea per carat), by grinding in a steel mortar.

To produce a plain polished surface on any stone, say a jasper, it goes through the three processes of cutting or slitting, grinding, and polishing. The diamond-slitting machine (the emery-machine is essentially the same) is shown in fig. 1. The

Fig. 1.

slitting-wheel, A, which is driven by means of the handle, B, is a mere disc of thin sheet-iron, from 6 to 9 inches in diameter, with a turned edge, and is generally placed in a horizontal position. The diamond-dust, mixed with a little sperm-oil, is applied to the edge of the slitting-wheel with the finger, and is then pressed into the soft iron with a smooth hard stone. The wheel will then continue to cut for several hours without any renewal of the powder. When the wheel is thus prepared, a stone held by the hand to the cutting edge is rapidly slit through. During the operation, sperm-oil is kept dropping from the can, C, to keep the wheel from heating.

The grinding is performed on a horizontal lead-wheel, charged on its upper surface with emery-powder; the stone to be ground being pressed against it with the hand until it is smooth enough for polishing. In polishing, a tin wheel is substituted for the leaden one, the polishing material being rotten-stone.

If, instead of a plane flat surface, some ornamental surface is required, say an agate brooch in the shape of a butterfly, a model is produced in plaster of Paris, to serve as a guide, and metal size-plates are prepared for the pieces of stone which are to form the wings, &c. For these, thin slices of agate are cut at the slitting-machine, or chipped off with a hammer and chisel, and are then formed roughly into shape, by means of soft iron nippers. The several pieces are now ground and polished, as already described, and the brooch is finished. When pieces of stone are too small to be held in the hand, they are attached with cement to a wooden handle, and then applied to the wheels.

One of the most elaborate operations of the lapidary is the cutting of Cairngorm (q. v.) stones. The mode of faceting the surface, which so much enhances their beauty, is shown in fig. 2, which is just the ordinary grinding-wheel, with the addition

of a wooden peg, stuck round with projecting wire. The stone is fixed with cement on the end of a stick, having a hole at the other end fitting on the wire-points, which, being at different heights, enables the stone to be held at any angle to the grading surface. With this simple guide, the lapidary proceeds to cut the facets, dividing them off

Fig. 2.

by the eye, aided by his sense of feeling; and in this way, in about a fortnight's time, as many as 700 facets are produced of perfect regularity upon a stone, say an inch in diameter. A Cairngorm of good colour, so cut, may be worth about £30.

LAPIS LAZULI, a mineral of beautiful ultramarine or azure colour, consisting chiefly of silica and alumina, with a little sulphuric acid, soda, and lime. The colour varies much in its degree of intensity. L. L. is often marked by white spots and bands. It is generally found massive, and is translucent at the edges, with uneven, finely granular fracture, but sometimes appears crystallised in rhombic dodecahedrons, its primitive form. It is found in primitive limestone and in granite; in Siberia, China, Tibet, Chili, &c. The finest specimens are brought from Bucharra. The Greeks and Romans called it *Sapphira*. It was more highly esteemed by them as an ornamental stone than it now is. They used it much for engraving, for vases, &c. It is extensively employed in ornamental and mosaic work, and for sumptuous altars and shrines. It is easily wrought, and takes a good polish. The valuable pigment called Ultramarine (q. v.) is made from it. It is one of the minerals sometimes called *Azure Stone*.

LAPITHÆ, a wild race, inhabiting, in ancient times, the mountains of Thessaly. They derived their name from a mythical ancestor, *Lapithes*, a son of Apollo, and the brother of Centauros, the equally mythical ancestor of the Centaurs (q. v.). A bloody war is said to have been waged between the kindred races in pre-historic times, which ended in the defeat of the Centaurs, but the L. were in their turn subdued by Hercules.

LAPLACE, PIERRE SIMON, MARQUIS DE, one of the greatest of mathematicians and astronomers, was born 23d March 1749, at Beaumont-en-Auge, in the department of Calvados, was for some time a teacher of mathematics in the military school there, and afterwards went to Paris, where, having attracted the notice of D'Alembert, he was, through his influence, appointed professor in the military school, and was admitted a member of the Academy of Sciences. He had by this time mastered the whole range of mathematical science, as then known, and had besides solved several problems, which had for many years defied the attempts of geometers; and now it occurred to him to devote his mathematical powers to the service of astronomy, and he accordingly commenced to plan the work which afterwards appeared as the *Mécanique Céleste*. In his political life, L. presents a sorry picture. He

was appointed Minister of the Interior by Bonaparte, but was, after six weeks, deposed for incapacity. He continued, however, to receive marks of honour from Napoleon, and on the erection of the imperial throne, was made a count. In 1814, he voted for the appointment of the provisional government, for Napoleon's deposition, and the restoration of the Bourbons. After the second Restoration, Louis XVIII. made him a peer and a marquis. In the Chamber of Peers, he shewed, as he had done under the revolutionary government, the greatest unfitness for political affairs, and the most extreme servility. He died at Paris, 5th March 1827. L. was gifted with wonderful scientific sagacity; thus appears especially in his explanations of certain results of mathematical analysis formerly looked upon as inexplicable, but which he shewed to be the expression of physical phenomena which had hitherto escaped detection, and subsequent observations generally confirmed L.'s conclusions. Above all his powers, his wonderful memory shone pre-eminent. His *Mécanique Céleste*, and supplements to it (5 vols. Paris, 1799—1825), are, next to Newton's *Principia*, the greatest of astronomical works. His *Exposition du Système du Monde* (2 vols. Paris, 1796; 6th ed. 1824) is intended for those who cannot follow the difficult demonstrations and calculations in his great work. All L.'s important investigations were made for the purpose of testing the generality of the law of gravitation, and the cause of sundry irregularities in the motions of the planets. His works comprise many able treatises on particular subjects in Astronomy, Pure Mathematics, Probability, Mechanics, Heat, and Electricity; most of them being Memoirs communicated to the Academy of Sciences.

LAPLAND. The territory still known under this name does not constitute a separate political autonomy, but is included under the dominions of Sweden and Norway, and of Russia, to the articles on which we refer for a special notice of its several divisions. L., or the Land of the Lapps, which is called by the natives *Sámea*, or *Somellada*, occupies the north and north-east portions of the Scandinavian peninsula. Norwegian L. is included under the provinces of Norrland and Finmark; Swedish L., under North and South Bothnia, and divided into Tornat, Lulea, Pitea, Umeå, Umeå Lappmark; Russian L., under Finland, in the circles of Kemi and Kola. Norwegian L. comprises an area of nearly 26,500 square miles, with a native population of 5000; Swedish L., an area of 50,600 square miles, with 4000 inhabitants; and Russian L., an area of 11,300 square miles, with a population of 8800. These numbers refer merely to the true Lapps, in addition to whom there are Finns, Swedes, Norwegians, and Russians, settled in various parts of the Lappish territory, whose respective numbers probably bring the population of the several parts to about the following figures—viz., for Norwegian L., about 50,000; for Swedish L., about 14,000; and for Russian L., about 60,000; but the boundaries of these divisions are so loosely defined, and their areas and populations so variously given by different writers, that it is difficult to arrive at an accurate estimate of either. The climate of the Lappish territory is extremely cold for nine months of the year; while the excessive heat of July and August, when in the northernmost parts the sun never sets for several weeks, is only separated from the cold seasons by a short spring and autumn of a couple of weeks. The general limit of the cereals is 66° N. lat.; but barley can be grown as far north in L. as 70°. The country is covered over a considerable part of its surface with forests, consisting chiefly of birch, pine,

fir, and alder, and having an undergrowth of lichens and mosses, which supply abundant food for the herds of reindeer which constitute the principal sources of wealth to the inhabitants. Many elevated tracts are, however, entirely destitute of vegetation, and consequently uninhabitable.

The LAPPS or LAPLANDERS, who are classed ethnologically in the same family as the Finns, Ethnians, and Livonians, and who occupy the most northern parts of the Scandinavian peninsula, are distinguished, in accordance with the nature of their pursuits, as the *Soelappen* and the *Boelappen*, or the Seafaring and Land-tilling Lapps. They were originally all nomadic; but the difficulty of finding sufficient food within the limited space to which the increasing civilisation of the neighbouring people had gradually restricted them, has compelled some of the tribes to settle near the larger rivers and lakes, where they follow the pursuits of fishing and hunting with considerable success. They shew great skill as marksmen, and regularly supply the large annual markets of Vitangi and Kengis with game and skins, which are sent by Tornet to Stockholm, where they find a ready mart. The Lapps, who call themselves the *Sams* or *Sahmelade*, are a physically ill-developed, diminutive race, with small eyes, low forehead, high cheekbones, pointed chin, and scanty beard. They are, however, neither wanting in mental capacity nor manual dexterity; and in the Seminary for Lapp teachers at Trondenes, in the district of Senjen, several of the students have distinguished themselves by their extensive acquirements. In the mythical sagas of Scandinavia, the Lapps are represented as an inferior race, distinguished only for craft and treachery, and addicted to practices of sorcery. They are regarded, in accordance with the same authorities, as the original occupiers of the whole of Scandinavia, from the fertile and more southern portions of which they were in ancient times driven forth by the superior, god-descended race of Odin, who banished them to the inhospitable regions in which they are now circumscribed. Their tendency to deceit is probably in a great measure to be attributed to the inferior position in which they are kept by the Norwegians, Swedes, and Russians, near whom they live, for they are honest, and strongly attached to their own people and country; and although they are still superstitious and credulous, they are not devoid of religious sentiment. They conform to the Christian faith of their neighbours—the Norwegian Lapps belonging to the Lutheran, and the Russian Lapps to the Greek Church. The Bible has been translated into their own language, which is divided, like that of all nomadic tribes, into numerous dialects, whose many affinities and differences have of late years attracted much attention from Northern and German philologists. The number of the Lapps probably falls below 30,000, of whom rather more than half are included in the population of Sweden and Norway, the remainder dwelling within the Russian dominions. The reindeer is the chief source of wealth, supplying the people with most of the articles of food and clothing which they use. Their dwellings consist either of conically shaped mud-huts, raised on stakes, and almost impervious to light and air, or of hide-covered tents. Towns or villages are unknown amongst them. The contempt with which they are regarded by the tall, well-developed Norwegian peasants, hinders all amalgamation between the races, while their peculiar habits, and the tenacity with which they cling to their own customs, tends still more to isolate them from the neighbouring nations.

LA PLATA. See PLATA.

LA PORTE, a flourishing town in the north-west of Indiana, United States of America, 12 miles from Lake Michigan, and at the junction of several important railways. It contains 11 churches, 3 newspapers, and large foundries, machine-shops, and manufactories. Pop. (1860) 5028.

LAPPENBERG, JOHANN MARTIN, a German historian, was born 30th July 1794, in Hamburg. He studied medicine at Edinburgh, but afterwards devoted himself to historical and political studies. He resided for some time in London, and afterwards studied law and history in Berlin and Göttingen. He became the representative of his native city at the Prussian court in 1820, and in 1823 was appointed archivist to the Hamburg senate, an appointment which led to his discovery of many valuable historic records which were supposed to have been lost. In 1850, he represented his native city at the diet of Frankfurt. One of his principal works is a *Geschichte von England* (2 vols. Hamb. 1834—1837; with continuation in 3 vols. Hamb. 1853, and Gotha, 1855—1858, bringing down the history to the end of Henry VII.'s reign); the first volume of which has been translated into English by B. Thorpe, with the title of *A History of England under the Anglo-Saxon Kings* (2 vols. Lond. 1845), and the second, with that of *A History of England under the Norman Kings* (1 vol. 1857). He is the author also of the following works, which are remarkable for the care and research which they display; viz., *Urkundliche Geschichte des Ursprungs der deutschen Hanse* (2 vols. Hamburg, 1830); *Die Geschichte Helgolands* (Hamburg, 1831); also an edition of Ditmar of Merseburg, and many valuable works relating specially to Hamburg and Bremen.

LAPSE. A legacy is said to lapse if the legatee dies before the testator; for as a will only operates from the death of the testator, and at that time the legatee is dead, the legacy lapses; i.e., falls into and becomes part of the residuary estate. So as to a devise. See LEGACY.

LAPSED (*Laps*), the designation applied, in the early centuries of the Christian Church, to those who, overcome by heathen persecution, did not continue faithful to the Christian religion. Their number was most considerable, when, after a long time of peace, the first general persecution under Decius began; but those who saved themselves by flight were reckoned amongst the L., although their case was not regarded as equally bad with that of those who sacrificed to idols. The L. were at first punished by excommunication, and their reception into the church again was strenuously resisted; but in the 3d c. a milder course was generally adopted with regard to them. The treatment of the lapsed was one of the practical questions most earnestly discussed in the early church.

LAPWING (*Vanellus*), a genus of birds of the family *Charadriidae* (Plovers, &c.), differing from the plovers chiefly in having a hind-toe, which, however, is small. The nasal grooves are also prolonged over two-thirds of the beak.—One species, the COMMON L., CRESTED L., or PEEWIT (*V. cristatus*), is a well-known British bird. It is also a native of almost all parts of Europe, and of some parts of Asia and of Africa. It is found in Bengal, in China, in Japan, and in Iceland; but it is not a native of America. It is not quite so large as a pigeon, and has the head surmounted with a beautiful crest. The head and crest are black; the throat black in summer, and white in winter; the back is green, glossed with purple and copper colour. The name L. is derived from the sound which the wings make in flight; the name Peewit

(Scottish *Pearseep*), with the French *Dichéat*, the Swedish *Wipa*, the Danish *Kimit* and *Vile*, the old English *Wypp*, the Greek *Atz*, &c., from the plaintive note; the local Scottish *Teech-head* (Tuffthead), from the crested head. The L. is very plentiful in meads, open commons, and marshy tracts, in pairs during the breeding-season; and in winter in flocks, chiefly on the sea-shore. Its artifices to prevent the discovery of its nest are very interesting.

Lapwing (V. cristatus).

The nest is little more than a mere depression in the ground, and the full complement of eggs is usually four; but if some are taken away, the bird goes on laying, an instinct of which the egg-gatherers take advantage. The eggs are esteemed a great delicacy, and great numbers are sent to the London market, under the name of *Plovers' Eggs*, from the marshy districts of England. The bird itself is also highly esteemed for the table.—A pet L. in a garden is of great service in preventing the too great increase of worms and slugs.—Some species of L. have wattles at the base of the bill.—The *Tehuacan* of South America (*V. Caymanensis*), a species with spurs on the wings, abounds on the Pampas of South America, is noisy on the approach of travellers, like the common L., and its eggs are likewise in the highest esteem as a delicacy.

LAR, an important town of Persia, capital of the province of Laristan, is situated on a well-wooded plain, at the foot of a ridge of hills, 60 miles from the Persian Gulf, and 160 miles south-south-east of Shiraz. The bazaar of Lar is said to be the finest and most elaborate in Persia. Pop. 12,000, who manufacture swords, muskets, and cotton-cloth.

LARBOARD, an obsolete naval term for the left side of a vessel, looking forwards. From its liability to be confused by the steersman with the not very different sound, 'starboard,' the word was a few years ago officially abolished, and the expression 'port' arbitrarily substituted. The terms *starboard* and *larboard* were originally Italian—*quarto d'orlo*, this side (the right); and *quello d'orlo*, that side (the left); which were contracted into *'sto d'orlo* and *'lo d'orlo*, and finally became starboard and larboard. The word *port* is said to be an abbreviation of *porta de timone*, 'carry the helm,' suggesting the analogy of porting the arms on the left hand.

LARCENY is the technical legal term used in England and Ireland to denote the crime of stealing. Simple larceny means larceny unaccompanied with other crimes or circumstances of aggravation. Larceny is defined as an unlawful taking of things personal, with intent to deprive the right owner of the same. On each word and phrase of this definition many commentaries have been written; but as everybody understands what theft is, it is scarcely

necessary to enter into detailed explanations as to the variety of circumstances attending its perpetration. The common law, which was very defective in not mentioning many subjects which are now capable of larceny, such as title-deeds, wills, pigeons, dogs, oysters, vegetables, fruits, fixtures, &c., has been amended by various statutes, the provisions of which have been nearly all consolidated in the recent act 24 and 25 Vict. c. 96. An ancient doctrine of the common law was, that carriers, trustees, &c., could never be convicted of larceny, because they got the possession of the goods lawfully, in the first instance; but now these persons may be convicted of stealing, like others. Formerly, there was a distinction between petty larceny and grand larceny, according as the value of the thing stolen was under or above twelvepence; and the punishment was more severe in the latter case. The distinction has been abolished, and in all cases the crime of larceny is felony, though there are certain things, such as fruit, vegetables, hares, &c., the taking of which, though unlawful, and often called stealing, is not treated as such, but is punished by a moderate fine or imprisonment. Whoever corruptly takes a reward under pretence of assisting in recovering stolen property, unless he use due diligence to cause the offender to be brought to trial, is guilty of felony, and liable to seven years' penal servitude, or two years' imprisonment. Whoever shall publicly advertise a reward for the return of stolen property, stating that no questions will be asked, or promising to return to pawnbrokers or others any money advanced on such property, and also whoever shall print or publish such advertisement, shall forfeit £50 to any person who will sue for the same.

The punishment of larceny has varied in this as in all countries. In the Jewish law, it was punishable by fine and satisfaction to the owner. At Athens, it was converted from a capital offence into an offence punishable by fine. Our Saxon laws punished larceny, if the thing was above twelvepence in value, with death; but the law became subject afterwards to the softening effects of the Benefit of Clergy (q. v.). In 1827, the distinction of petty larceny was abolished, and every person convicted of simple larceny of any amount, was made liable either to transportation or imprisonment; but later statutes have abolished the punishment of transportation, and now the general punishment for simple larceny, and for felonies punishable like simple larceny, is penal servitude for three years, or imprisonment not exceeding two years, with or without hard labour and solitary confinement, and in the case of a male under 16, with or without whipping—such whipping to be administered by a birch-rod, and not more than twelve strokes. In case of previous offences, the term of penal servitude may be extended to seven or ten years. In some cases considered to be attended with great aggravation, as stealing linen, woollen, silken, &c. goods while in process of manufacture, if of the value of ten shillings, the term is increased to 14 years' penal servitude. In stealing cattle, the term is also 14 years, or imprisonment for two years. Larceny in a dwelling-house of money or goods above five pounds in value, is subject to 14 years' penal servitude, or two years' imprisonment; and the same is the punishment, whatever be the value, if by threats any one therein is put in bodily fear. The same punishment is awarded to larcenies in ships, wharfs, &c. Larceny from the person, when attended with personal violence, is called robbery. Robbery is felony punishable with 14 years' penal servitude, or two years' imprisonment. If it amount only to an assault with

intent to rob, the punishment is two years' imprisonment, or three years' penal servitude. Again, if the assault or robbery was with offensive weapons, or in company with other criminals, or attended with personal violence, the punishment is penal servitude for life. Larceny by a clerk or servant is punishable with 14 years' penal servitude, or two years' imprisonment. Larceny of letters by post-office letter-carriers is punishable with seven years' penal servitude, or two years' imprisonment, and if the letter contained money, with penal servitude for life. Receivers of stolen property are also guilty of felony, and punished with 14 years' penal servitude, or two years' imprisonment.

Besides the offences under the head of larceny which are indictable, there are many cognate offences which have been included in the same consolidation statute, but which are considered so far of a petty nature as not to merit the solemn punishment by indictment, and are left to be punished summarily by justices of the peace. Thus, some offences relating to wild animals and game are so treated; for example, hunting, carrying away or killing deer in the unenclosed part of a forest or park is punishable by justices with a fine of £50; and persons in possession of deer-skins, and not accounting for them, or setting snares for deer, incur a penalty of £20. Taking or killing, or setting snares unlawfully for hares or rabbits in enclosed ground by day, subjects the party to a penalty of £5. Stealing a dog is subject to a penalty of £20, over and above the value of the dog; and having a stolen dog or its skin in one's possession, subjects to a penalty of £20. Stealing birds, beasts, or other animals ordinarily kept in a state of confinement, or for any domestic purpose (not being fit for food), or willfully killing the same, with intent to steal, subjects to a penalty of £20, besides the value, or to six months' imprisonment. Killing or wounding house-doves or pigeons subjects the party to a penalty of £2, besides the value of the bird. Taking or destroying fish in a stream or water which is private property, subjects the party to a penalty of £5, besides the value of the fish; and angling in the same induces a penalty of £2, besides seizure of the fishing-tackle. Stealing trees and shrubs or underwood worth 1s., subjects the party to a penalty of £5; so does stealing or destroying fences, or posts, wires, &c., used as such. Stealing fruit or vegetables from gardens, &c., subjects the party to a penalty of £20, besides the value, or to six months' imprisonment. Stealing cultivated roots or plants used for the food of man or beast, or for medicine, growing in fields, &c., subjects the party to a fine of 20s., besides the value, or to one month's imprisonment. Having shipwrecked goods knowingly in one's possession, or exposing the same for sale, subjects to a penalty of £20, besides the value, or to six months' imprisonment. See **LOST PROPERTY**.

In Scotland, theft is distinguished into trifling theft or pickery, which is punishable with fine, imprisonment, or whipping. Simple theft was never a capital offence, unless aggravated, as theft by a trustee, theft of cattle, or of children. The punishment of theft in Scotland is left very much to the discretion of the court.

LARCH (*Larix*), a genus of trees of the natural order *Coniferae*, differing from firs (*Abies*)—of which, however, some botanists regard it as a mere sub-genus—in having the scales of the cones attenuated at the tip, and not falling off from the axis of the cone when fully ripe, and the leaves deciduous and in clusters, except on shoots of the same year, on which they are single and scattered.—The **COMMON L.** (*L. Europaea* or *Abies Larix*) is a beautiful tree,

growing wild on the mountains of the south and middle of Europe, and found also in Asia, where it extends much further north than in Europe, even to the limits of perpetual snow. The L. is not a native of Britain, and was not planted in any part of the island as a forest tree till the middle of the 18th c., when it began to be very extensively planted. Its introduction has changed the aspect of whole districts, particularly in Scotland. The perfectly erect and regularly tapering stem of the L., its small branches, its regular conical form, and its very numerous and very small leaves, make its aspect peculiar, and very different from that of any other tree seen in Britain. It attains a height of 60—100 feet, and an age of 200 years. The male catkins are small and bright yellow, the female catkins generally purple and erect; the cones ovate-oblong, about an inch long, and erect. The L. grows rapidly, and is useful even from an early age; the thinnings of a plantation being employed for hop-poles, palings, &c.; the older timber for a great variety of purposes.

It is very resinous, does not readily rot even in water, is not readily attacked by worms, and is much used in ship-building. It is, however, very apt to warp, and is therefore not well suited for planks.—L-bark is used for tanning, although not nearly equal in value to oak-bark.—In Siberia, where large tracts of L. forest are not unfrequently consumed by accidental fires, the scorched stems yield, instead of a resin, a gum similar to gum-arabic, reddish, and completely soluble in water, which is known as *Orenburgh Gum*, and is used for cementing and in medicine, and, notwithstanding a somewhat resinous smell, even as an article of food.—In warm countries, a kind of Manna (q. v.) exudes from the leaves of the L., in the hottest season of the year, having a sweetish taste, with a slight flavour of turpentine. It is gathered principally in France, and is known as *Briançon Manna*, or *L. Manna*.—The L. woods of Britain have of late years suffered greatly from a disease, in which the centre of the stem decays; the nature and causes of which are very imperfectly understood, although it seems to be sufficiently ascertained that those plantations are peculiarly liable to it which are formed where any kind of fir has previously grown, and those least so which are regularly thinned, so that the trees enjoy abundance of fresh air. The L. does not dislike moisture, but stagnation of water is very injurious to it, and thorough drainage is therefore necessary.—There are varieties of the Common L. remarkable for crowded branches, for pendulous branches, and for other peculiarities, which are sometimes planted as ornamental trees.—The **RED AMERICAN L.**, or **HACKMATAK** (*L. tenuifolia*), distinguished by very small cones not quite half an inch in length, is common in the northern parts of North America, and on the Alleghany Mountains, often covering extensive tracts. It is a noble tree, much

Larch (*L. Europaea*).

resembling the common L., and its timber is highly valued.—The PENDULOUS L., or BLACK AMERICAN L. (*L. pendula*), is another very fine North American species, with larger leaves.—The HIMALAYAN L. (*L. Griffithii*), abounds in the Himalaya, but is generally a small tree of 20–40 feet high. Its cones are larger than those of the Common Larch. Its wood is very durable.

LARD, the fat of the hog. Until after the first quarter of the present century, lard was only used for culinary purposes, and as the base of various ointments in medical use. The enormous extent, however, to which pork was raised in America, rendered it necessary to find some other applications for so valuable a material, and large quantities were pressed at a low temperature, by which the stearine and oleine were separated. The former was used for candle-making; and the latter soon became a very important article of commerce, under the name of 'lard oil,' which was found to be a valuable lubricant for machinery. As much as 20,000 tons of lard, stearine of lard, and lard oil have been imported in one year, more than two-thirds of which were from the United States of America. The manufacture of stearine candles and fine oleine from palm oil, cocoa-nut oil, and various kinds of grease, by Messrs Price & Co., and other large manufacturers, has greatly diminished the imports from America.

LARDNER, NATHANIEL, D.D., an eminent English divine, was born at Hawkshurst, in Kent, in 1684, and studied first in London, and afterwards at Utrecht and Leyden. L. belonged to a body of English Presbyterians, who had become Unitarians. He died in 1768. L. was not a popular preacher; but his *Credibility of the Gospel History*, and his *Jewish and Heathen Testimonies*, have secured for him a permanent place among the modern apologists for Christianity. The last edition of his works, in ten volumes, appeared at London in 1828.

LARDNER, DIONYSIUS, LL.D., a distinguished writer on physical science, was born in Dublin, April 3, 1793, and first became known by his *Treatise on Algebraical Geometry* (Lond. 1823), and by a work on the *Differential and Integral Calculus* (Lond. 1825). In 1828, he was appointed Professor of Natural Philosophy and Astronomy in University College, London; and in 1830, he projected a sort of encyclopædia, consisting of original treatises on history, science, economics, &c., by the most eminent authors; and 134 volumes were accordingly published, under the general name of *Lardner's Cyclopædia*, between 1830 and 1844. Some of these volumes were from his own pen. A second issue of this work was begun in 1853. He has published various scientific works, the most important of which are his 'handbooks' of various branches of natural philosophy (1854–1856). He is also the author of the *Museum of Science and Art*, an excellent popular exposition of the physical sciences, with their applications. He died in Paris, April 29, 1859.

LARES, MANES, AND PENATES, were tutelary spirits, genii, or deities of the ancient Romans. The derivation of the names is not perhaps quite certain, but the first is generally considered the plural of *lar*, an Etruscan word signifying 'lord' or 'hero'; the second is supposed to mean 'the good or benevolent ones'; and the third is connected with *penæ*, 'the innermost part of a house or sanctuary.' The Lares, Manes, and Penates do not appear to have been regarded as essentially different beings, for the names are frequently used either interchangeably or in such a conjunction as almost implies identity. Yet some have thought that a distinction is discernible, and have looked upon the Lares as

earthly, the Manes as infernal, and the Penates as heavenly protectors—a notion which has probably originated in the fact, that Manes is a general name for the souls of the departed, those who inhabit the lower world; while among the Penates are included such great deities as Jupiter, Juno, Vesta, &c. Hence we may perhaps infer that the Manes were just the Lares viewed as departed spirits, and that the Penates embraced not only the Lares, but all spirits, whether daimons or deities, who exercised a 'special providence' over families, cities, &c. Of the former, Manes, we know almost nothing distinctively. An annual festival was held in their honour, on the 19th of February, called *Feralia* or *Parentalia*; of the latter, Penates, we are in nearly equal ignorance, but of the Lares we have a somewhat detailed account. They were, like the Penates, divided into two classes—*Lares domestici*, and *Lares publici*. The former were the souls of virtuous ancestors set free from the realm of shades by the Acherontic rites, and exalted to the rank of protectors of their descendants. They were, in short, household-gods, and their worship was really a worship of ancestors. The first of the Lares in point of honour was the *Lar familiaris*, the founder of the house, the family Lar, who accompanied it in all its changes of residence. The *Lares publici* had a wider sphere of influence, and received particular names from the places over which they ruled. Thus, we read of *Lares compitales* (the Lares of cross-roads), *Lares vicorum* (the Lares of streets), the *Lares rurales* (the rural Lares), *Lares viales* (the Lares of the highways), *Lares permariis* (the Lares of the sea), and the *Lares cubiculii* (the Lares of the bedchamber). The images of these guardian spirits or deities were placed (at least in large houses) in a small shrine or compartment called *adnicula* or *lararia*. They were worshipped every day: whenever a Roman family sat down to meals, a portion of the food was presented to them; but particular honours were paid to them on the Calends, Nones, and Ides of the month; and at festive gatherings, the *lararia* were thrown open, and the images of the household gods were adorned with garlands.

LARGESSE, money which, in early times, it was the practice to grant to heralds on certain state occasions, for proclaiming the style and title of the sovereign and his nobles. The regular fees, as recorded in one of the Ashmolean MSS., were, 'At the coronation of the king of England, c. appraised in scarlet. At the displaying of the king's banner in any campe, c. markes. At the displaying of a duke's banner, £20; at a marquis', 20 markes; at an earle's, 10 markes. The king marrying a wife, £50, with the giftes of the king's and queene's uppermost garments; at the birth of the king's eldest son, 100 markes; at the birth of younger children, £20. The king being at any syge with the crowne on his head, £5.'

LARGO, an Italian word, used in music, to denote the slowest of all the *tempi*, and especially in compositions where the sentiment is quite solemn. LARGHETTO is the diminutive of *Largo*.

LARGS, a small town on the coast of Ayrshire, Scotland, a favourite resort for sea-bathers, is beautifully situated on the Firth of Clyde, on a pleasant strip of shore, backed by hills, 18 miles below Greenock. The population in 1861 was 2638, but the number is greatly increased in mid-summer. Here, in 1263, Alexander III. of Scotland, in the course of a war between that country and the Norwegian colonies of Man and the Isles, defeated Hacon, king of Norway, who, with 160 ships and 20,000 men, had descended upon the coast of Ayrshire. The results of this battle were

the immediate withdrawal of the invading force, and the abandonment within three years of the Norwegian pretensions to the Scottish Islands.

LARIOIO. See **PIRE.**

LARIDÆ, a family of birds, of the order *Pelecaniformes* or *Nalatoræ*, called *Longipennes* by Cuvier, from the length of wing which is characteristic of them. They are generally capable of protracted as well as of rapid and graceful flight; all of them are sea-birds, although some resort to breeding-places at some distance inland, and some follow the course of rivers to very considerable distances from the sea. Some of them are the most oceanic of all birds, being often seen far from any shore. They generally take their prey either by a sudden descent to the water during flight, or whilst swimming, and are not good divers. The hind-toe is small and free; the bill is pointed or hooked, but destitute of lamellæ. Gulls, Skuas, Terns, Petrels, Shearwaters, Albatrosses, Noddies, Skimmers, &c., belong to this numerous family, which has many representatives in all parts of the world. They prey chiefly on fishes and molluscs, and are in general ready to eat any animal garbage.

LARİSSA (called by the Turks *Yemitchir*), a town of European Turkey, in the province of Thessaly, and one of the most ancient and important in that territory, is situated on the Salembria (anc. *Peneus*), in lat. 39° 57' N., long. 22° 25' E. It contains numerous mosques, from which arise many slender and dazingly white minarets. It carries on an important transit-trade, with manufactures of silk and cotton goods, and Turkey-red dyeworks. Pop. 23,000. In ancient times it was celebrated for its bull-fights.

LARİSTAN AND MOGISTAN, two maritime provinces of Persia, bounded on the E. by the Persian Gulf, and the Gulf of Oman, and on the N. by the provinces of Faristan and Kerman.

LARK (*Alauda*), a genus of small birds of the order *Insectorum*, section *Canirostræ*, the type of a family *Alaudidæ*, to the whole of which the English name is commonly extended. In this family, the bill, although stout and nearly conical, is more lengthened than in buntings and finches. The toes are long, and separate to the base; the claws long and little curved, that of the hind-toe generally very long. The true larks (genus *Alauda*) have also long wings, and great power of flight. Many of them are birds of passage. In common with almost all the family, they nestle and seek their food—seeds, insects, worms, &c.—on the ground; and in admirable harmony with this mode of life, their plumage exhibits much uniformity of colouring, so that when on the ground they may not readily be noticed by their enemies. The L.

forth whilst soaring and floating in the air, and which every one associates with pleasant scenes and delightful days. It more rarely sings on the ground. It is in great repute as a cage-bird, and sings well in confinement, but flutters its wings whilst singing, as if still desirous of soaring in the air. It abounds chiefly in open but cultivated districts. It is common in most parts of Europe, but from the more northern parts, it migrates southward on the approach of winter. It is also a native of Asia, and is a winter visitor of the north of Africa. It is not found in America. It makes its nest generally in an open field, and often under shelter of a tuft of herbage, or a clod of earth; lays four or five mottled eggs, and generally produces two broods in a season. It is not truly gregarious in summer, but in winter large flocks assemble together; and at this season multitudes of larks are taken for the table in the south of England, in France, and other countries. They are often caught by horse-hair nooses, attached to a long line of packthread, to which the nooses are fastened at distances of about six inches, the line being pegged to the ground at intervals of twenty yards. This mode is most successful when the ground is covered with snow, and a little corn is scattered along the line. The Clap-net (q. v.) and Trammel-net (q. v.) are also employed by lark-catchers, and great numbers of larks are taken in some parts of England by dragging the trammel-net over the stubbles and pastures. *Twirling for larks* is a peculiar mode of turning to account the attractiveness which any glittering object possesses for these birds. It is a French practice. A piece of highly polished mahogany, or of some common wood inlaid with bits of looking-glass, is fastened on the top of a rod, so as to reflect the sun's rays upwards, and is made to twirl by means of a string. Larks are greatly attracted by it, congregate around it, and are readily shot in large numbers.—The **CASSELL L.** (*A. cristata*), very similar in size and plumage to the common L., but having the feathers of the crown of the head more distinctly developed into a crest, although a very common bird in many parts of Europe, and abundant near Calais, has very seldom been seen in Britain.—The **WOOD L.** (*A. arvensis*), a smaller species, not unfrequent in some parts of England, but rare in Scotland, is a bird of very delightful song, and usually sings perched on the branch of a tree. It frequents wooded districts. Its nest, however, is made on the ground.—The **SHORE L.** (*A. alpestris*), which has only in rare instances been found in Britain, inhabits the northern parts of Europe, Asia, and America, and is the only North American species. Its song is very sweet, and gladdens the visitor of such desolate shores as those of Labrador, where it breeds, amidst the tufts of mosses and lichens, with which the bare rocks are interspersed. It is a winter visitor of New England, and is sometimes seen as far south as Georgia. The head has two erectile tufts of feathers, somewhat resembling those of horned owls. Black, white, and yellow vary the brown plumage of the Shore Lark.

LARKHANA, the capital of a district of its own name in Sindh, stands 145 miles north of Hyderabad. It contains about 12,000 inhabitants, and manufactures silk and cotton, besides being one of the largest corn-marts in the country.

LARKSPUR (*Delphinium*), a genus of plants of the natural order *Ranunculaceæ*, annual and perennial herbaceous plants, natives of the temperate and cold regions of the northern hemisphere. They have five sepals, the upper spurred; four petals, distinct or united into one, the two upper having spurs inserted into the sepaline spur; and 1-5 many-seeded

Sky Lark (*Alauda arvensis*).

family is very widely distributed over the world. The **COMMON L.**, **FIELD L.**, or **SKY L.** (*Alauda arvensis*), is one of the best-known British birds, and notwithstanding the commonness of its brown plumage, is a universal favourite, on account of the sweetness of its cheerful song, which it pours

follicles. Some of them are well known and favourite garden-flowers, as the *Uranus* L. (*D. Ajacis*), a native of Switzerland, and the *Branche* L. (*D. consolidida*), a native of most parts of Europe, and a

Palmated Larkspur or Stavesacre (*Delphinium stoebeoides*).

rather doubtful native of England. *D. glaciale* is one of the most alpine plants in the world.

LARMES, in Heraldry. When the field is bestrewn with an indefinite number of drops of a blue colour, it is said to be *gutté de larmes*, a nomenclature which, though French, is peculiar to British Heraldry, the French blazoning such a shield *gutté d'eau*.

LAROCHEFOUCAULD, an old French family of great celebrity, whose original seat was the small town of Larochefoucauld, near Angoulême. The history of the family is traced back to 1026, when a certain Foucauld, first seigneur de la Roche, is spoken of in a charter of an abbey of Angoulême as *vir nobilissimus Fulcaudus*. In the religious wars of the 16th c., it embraced the cause of the Protestants.—**FRANÇOIS, DUC DE L.** and **FRANÇOIS DE MARILLAC**, born 1613, was much attached to literary pursuits; and after having been involved in intrigues against Cardinal Richelieu, and in the tumults of the Fronde, he retired into private life, cultivated the society of the most eminent literary persons of his time, Boileau, Racine, and Molière, and composed his famous *Mémoires* (Cologne, 1662; Amst. 1723, &c.), in which he gives a simple but masterly historic account of the political events of his time. In 1665, he published also his *Réflexions ou Sentences et Maximes Morales*, a work containing 360 detached thoughts, of which, perhaps, the most widely celebrated is his definition of hypocrisy, as 'the homage which vice renders to virtue.' The book is regarded as a model of French prose, and exhibits much acuteness of observation, and a clear perception of the prevalent corruption and hypocrisy of his time. He died 17th March 1680. His *Œuvres Complètes* were edited by Depping (Par. 1818), and his writings have been commented on by a host of critics of the most different schools, as Voltaire, Vinet, Sainte-Beuve, and Victor Cousin.—**FRANÇOIS ALEXANDRE FRÉDÉRIC, DUC DE L.-LIANCOURT**, an eminent philanthropist, born 11th January 1747, was representative of the nobles of Clermont in the States-general, and was a zealous advocate of reform, but sought to preserve the monarchy. After the catastrophe of 10th August, he fled to England,

and lived in great penury, till he obtained back, in 1794, some fragments of his property. He now visited North America, and afterwards published his *Voyage dans les États-Unis d'Amérique fait en 1795—1797* (8 vols. Par. 1798). Having returned to Paris, he lived for some time in retirement, occupied only with the extension of vaccination and similar works of benevolence. Napoleon restored him his ducal title in 1809. After the Restoration, he was made a peer, but soon gave offence to the court, by opposing its unconstitutional policy. He laboured zealously in promotion of many patriotic and philanthropic objects. He founded the first savings-bank in France. He died 27th March 1827.

LAROCHEJAQUELEIN, DU VERGER DE, an old noble family of France. The name Du Verger is derived from a place in Poitou. Guy du Verger married, in 1506, the heiress of the seigneur of Larochesjaquelein. Several of his descendants distinguished themselves as soldiers, after the beginning of the French Revolution, by their strenuous efforts in the cause of the Bourbons.—**HENRI, COMTE DE LAROCHEJAQUELEIN**, born 1772, was an officer in the guard of Louis XVI., and after the 10th of August 1792, left Paris, and put himself at the head of the insurgent royalists in La Vendée. He signalised himself by many heroic deeds, and for a time successfully repelled the republican forces, but was defeated by Generals Westermann, Müller, and Tilly, 13th December 1793, and escaped with difficulty. He raised a new body of troops, however, in Upper Poitou, but was killed in a battle at Nouaillé, 4th March 1794.—His brother, **LOUIS DU VERGER, MARQUIS DE LAROCHEJAQUELEIN**, born 1777, emigrated at the commencement of the Revolution; returned to France in 1801, but resisted all Napoleon's efforts to win him, and in 1813 placed himself at the head of the royalists in La Vendée. Louis XVIII. appointed him, in 1814, to the command of the army of La Vendée, and during the Hundred Days he maintained the royalist cause there, supported by the British. He fell in battle at Font-des-Mathis, 4th June 1815. His wife, **MARIE-LOUISE VICTOIRE, MARQUISE DE LAROCHEJAQUELEIN** (born 1772—died 1857), published *Mémoires of the War in La Vendée*, of which she was an eye-witness (Bordeaux, 1855), which are of great value, and have gone through many editions.

LA ROCHELLE. See **ROCHELLE, LA.**

LARREY, DOMINIQUE JEAN, BARON, a celebrated French surgeon, was born in 1766 at Baudéan, near Bagnères-de-Bigorre, studied medicine with his uncle, Alexis L., and attended the two hospitals, the Hôtel-de-Dieu and the Hôtel-des-Invalides, having previously served for a short time both in the army and navy. In 1792, he was appointed second physician to the Hôtel-des-Invalides, and in 1793 accompanied the French army to Germany and Spain, making at this time the important invention of the *ambulance volante*, for the convenience of transporting the wounded. Napoleon summoned him to Italy in 1797, after he had been for a short time a professor in the medico-surgical school at Val-de-Grâce; and he accompanied the expedition to Egypt. In 1805, he was placed at the head of the medico-surgical department in the French army, and was created a Baron of the Empire, receiving also a considerable pension. He was wounded and taken prisoner at Waterloo, and at the Restoration lost his rank and pension; the latter, however, was restored in 1818; and he continued to fill important and honourable offices till 1836 when he retired from that of surgeon-general of the Hôtel-des-Invalides. On the 15th of May 1848 he embarked for Algeria, having been appointed

inspector of the military hospitals there, and while on his return, after having concluded his labours, he died at Lyon, 24th July 1842. Apart from the skill, talent, courage, and humanity shewn in the course of his practice, L. has a high scientific reputation, and is the author of a number of very valuable books on various subjects connected with his profession, most of which have been translated into other languages. L.'s works have been considered by eminent authorities to be 'the connecting link between the surgery of the last age and that of the present day.'

LARVA, in Natural History, is the denomination of animals which undergo transformation, in that state in which they first exist after issuing from the egg. Until recently, the larva state was known in insects only, and the term larva is still commonly used only with regard to them; but it has been discovered that many marine animals spend a considerable part of their existence in such a state, during which they are often extremely different from what they become after their next transformation; some of them, as the young of the Cirrhopods, swimming about freely in the larva state, whilst they become firmly fixed to one spot when they have reached their perfect development, and—which seems still more remarkable—possessing eyes in the former state, and becoming destitute of them in the latter. The larva state of crabs exhibits a very singular form, long known as a distinct genus of crustaceans, under the name *Zoëa*. The young of at least some Entozoa pass through a larval state; those of the tape-worms were formerly regarded as creatures altogether distinct, and received the generic name *Scöler*, which when now used is with regard to these animals equivalent to larva.—The larvæ of insects differ very much in the degree of their development, the differences being characteristic of different orders; some of them much resembling the perfect insect, except in the want of wings, and others being very unlike it. The larvæ of many insects, particularly those which are very unlike the perfect insect, as grubs (coleopterous larvæ), maggots (dipterous larvæ), and caterpillars (lepidopterous larvæ), accumulate fat in great quantity, which serves to sustain them during their *Pupa* (q. v.) state, in which they take no food. The same accumulation of fat does not take place in larvæ more nearly similar to the perfect insect, as in neuropterous insects, the pupæ of which are active and voracious.

LARYNGITIS, or INFLAMMATION OF THE LARYNX, may be either an acute or a chronic affection. Acute laryngitis, in its more severe form, commences with a chill, which is followed by fever, with a full strong pulse, a hot skin, and a flushed face. There is also soreness of the throat, hoarseness of the voice, great difficulty in swallowing, and a feeling of extreme constriction of the larynx. There is a painful stridulous cough, but only a little mucus is ejected. Great difficulty of breathing soon comes on, the act of inspiration being prolonged, and wheezing, in consequence of the swollen membrane of the glottis impeding the entrance of air. On examining the fauces, the epiglottis (see **LARYNX**) is observed to be of a bright red colour, erect, and so much swollen as not to be able to descend and close the glottis during deglutition. The patient exhibits symptoms of great anxiety and distress; his lips become blue, his face of a livid paleness, his pulse irregular and very feeble, and at length he sinks into a drowsy state, often preceded by delirium, and quickly followed by death. The disease is very rapid, ending, when fatal, in three or four days, and occasionally in less than one day.

The most frequent cause of laryngitis, whether

mild or severe, is exposure to cold and wet, especially when in a state of perspiration. It frequently also arises from direct injury to the larynx, as from attempting to swallow boiling water or corrosive fluids, from inhaling irritating gases, &c.

In severe cases, the strongest antiphlogistic treatment must be at once adopted, as general bleeding, leeching, and either tartar emetic or calomel. If these fail, the only remedy upon which much reliance can be placed is tracheotomy. In chronic laryngitis, there is hoarseness, the voice is altered, and various morbid sensations are felt in the larynx, which excite cough. If the disease goes on to ulceration, phthisis or syphilis is probably its cause. The treatment of ulcerated larynx is noticed in **LARYNX, DISEASES OF**.

LARYNGOSCOPE and LARYNGOSCOPY. Although attempts had been previously made by Avery and Garcia to explore the recesses of the larynx by means of a reflecting mirror, it was not until two German physiologists, Drs Turck and Czermak, took up the subject in 1857 and 1858, that the great importance of laryngoscopy was first generally recognised.

The laryngoscope is a small mirror placed on a stalk attached to its margin, at an angle of from 120° to 150°, the stalk being about six inches in length, and being composed of flexible metal, so that it can be bent at the will of the operator.

The mouthpiece of a large reflector, with a central opening through which the observer looks, is held between the molar teeth; or, which is better, the reflector may be attached to a spectacle frame by a stiffly working ball-and-socket joint. The rays of the sun or of a good lamp are concentrated by means of this reflector on the laryngeal mirror, which is placed against the soft palate and uvula. The laryngeal mirror, introduced with the right hand, which rests by two fingers on the jaw, is maintained at such an inclination that it throws the light downwards, and illuminates the parts to be examined, while at the same time it reflects the images of these parts into the eye of the observer through the central opening of the reflector. By this means he can look through the larynx into the trachea or windpipe.

By means of this instrument we can see the actual position of small tumours, ulcers, &c., whose existence would otherwise have been at most only suspected; and the precision and accuracy of diagnosis to which we can thus attain, enable us to employ rational means of local treatment to an extent that was quite impossible before the introduction of laryngoscopy.

LARYNX, THE (Gr. *larynx*), is the organ of voice, and takes a part in the respiratory process, as all air passing either to or from the lungs must pass through it. It is a complex piece of mechanism, resembling a box composed of pieces of cartilage, which may be moved on each other, and enclosing the membranous bands (the *chordæ vocales*) by which the vocal vibrations are produced.

It is situated between the *trachea*, or windpipe, and the base of the tongue, at the upper and front part of the neck, where it forms a considerable projection (especially in men) in the mesial line; and it opens superiorly into the *pharynx*, or throat, and inferiorly into the windpipe.

The cartilages of which the skeleton of the larynx is composed are five in number—viz., the thyroid and the cricoid cartilages, the epiglottis, and the two arytenoid cartilages.

The *thyroid* (Gr. shield-like) cartilage consists of two square plates of cartilage united in front at an acute angle, which forms the projection which is

LARYNX.

commonly known as the *possum Adamsi*, or Adam's apple. Each of these plates is prolonged at the upper and lower posterior corners. The thyroid

Cartilages of larynx and epiglottis, and upper rings of trachea, seen from behind: *a*, arytenoid cartilages; *b*, superior cornua of thyroid cartilage; *c*, its inferior cornua; *d*, posterior surface of cricoid; *e*, epiglottis, with its perforations; *f*, upper margin of thyroid; *g*, its left inferior tubercle; *h*, trachea.

cartilage forms almost the whole of the anterior and lateral walls of the larynx.

The *cricoid* (Gr. ring-like) cartilage is a ring whose lower margin is parallel to the first ring of the trachea, to which it is united by fibrous membrane. Its upper border is connected in front with the lower border of the thyroid cartilage by a thick yellow fibrous tissue. It presents two articular surfaces on

Fig. 2.

C, the right arytenoid cartilage; *a*, its base articulating with the upper margin of the cricoid.

either side, viz., a lower one (*b* in B, fig. 2), which articulates with the inferior cornua of the thyroid cartilage, and an upper one (*b* in B, fig. 2), which is

oval in form, and supports an arytenoid cartilage. The *arytenoid* (Gr. ladle-like) cartilages are pyramidal bodies resting on the oval articular surfaces at the upper and posterior part of the cricoid cartilage. When *in situ*, they present a concave posterior surface (fig. 1). From their connection with the vocal cords, and from their great mobility as compared with the two larger cartilages, the arytenoids play a very important part in the mechanism of the larynx. The *epiglottis* is a very flexible cartilaginous valve (fig. 1, *f*), situated at the base of the tongue, and covering the opening of the larynx. Its direction is vertical, except during deglutition, when it becomes horizontal. It is attached inferiorly by a kind of pedicle to the angle of the thyroid cartilage. Upon removing the investing mucous membrane, the cartilage is found to be perforated by numerous foramina, *f*. Each perforation admits some fasciculi, of yellow, elastic, ligamentous tissue, which expands on its anterior aspect, and secures the return of the epiglottis to its vertical position, independently of any muscular action. Such is the skeleton of the larynx, which hangs from the hyoid bone, with which it is connected by the thyro-hyoid ligament and certain muscles.

The various cartilages which have been described are connected to one another by ligaments, the chief

Fig. 3.

View of larynx from above, after Willis. *b*, ligaments uniting arytenoid and cricoid cartilages; *c*, thyroid cartilage in front; *d*, left thyro-arytenoid muscle, right removed; *e*, *f*, *g*, cricoid cartilage; *h*, right crico-arytenoid muscle; *i*, arytenoid cartilage; *j*, *k*, vocal cords.

of which are those known as the true and false vocal cords. In their quiescent state, the true vocal cords do not lie parallel to each other, but converge from behind forwards (see fig. 3). The length of the vocal cords is greater in the adult male than in the adult female, in the ratio of three to two. In infancy, they are very short, and increase regularly from that period to the age of puberty. The mucous membrane of the larynx is part of the great respiratory tract (see *MUCOUS MEMBRANE*), and is remarkable for its great sensibility.

The length of the chink or aperture of the glottis, which is directed horizontally from before backwards, varies, like the vocal cords, until the period of puberty, when its length, in the male, undergoes a sudden development, while in the female it remains stationary. In the adult male, it is about eleven lines in length.

The larynx is provided with two sets of muscles, viz., the *extrinsic*, by which the whole organ is elevated or depressed, and the *intrinsic*, which regulate the movements of the various segments of the organ in relation to one another. By the action of these latter muscles, aided, in some cases,

deck, by means of a mast crossing it at a third or a fourth of the way up.

LATENT FAULT. In the contract of sale, it is a rule that the buyer takes the risk of all latent faults or defects in the thing sold which were unknown to the seller at the time of the sale, all that the seller answers for being, that the thing is, so far as he knows, what it appears to be. This, which was the English rule, was extended to Scotland by the statute 19 and 20 Vict. c. 60, s. 5.

LATENT HEAT. See **HEAT**.

LA'TERAN, CHURCH OF ST JOHN, the first in dignity of the Roman churches, and styled in Roman usage 'the Mother and Head of all the churches of the city and the world,' is so called from its occupying the site of the splendid palace of Plantius Lateranus, which having been escheated (66 A.D.), in consequence of Lateranus being implicated in the conspiracy of the Pisos, became imperial property, and was assigned for Christian uses by the Emperor Constantine. It was originally dedicated to the Saviour; but Lucius II, who rebuilt it in the middle of the 12th c., dedicated it to St John the Baptist. The solemn entrance of the newly elected pope into office is inaugurated by his coming in procession to take possession of this church; and over its portico is the balcony from which, on certain festivals, as from St Peter's upon other days, he blesses the entire world. The original church is said to have been an adaptation to religious uses of the Basilica which was presented to Sylvester by Constantine, but has been several times rebuilt and modified, its final completion dating from the pontificate of Clement XII. It has been the scene of five councils, regarded as ecumenical by the Roman Church. See **COUNCIL**. The palace was the habitual residence of the popes until after the return from Avignon, when they removed to the Vatican. It is now occupied partly by officials of the chapter, partly for public purposes. The present pope, Pius IX., has converted a portion of it into a museum of Christian archaeology. In the piazza of St John Lateran stands the celebrated relic called the 'Scala Santa,' or 'Holy Staircase,' which is reputed to be the stairs of Pilate's house at Jerusalem, made holy by the feet of our Lord as he passed to judgment.

LA'TERITE, a mineral substance, the product of the disintegration and partial decomposition of gneiss. It forms a bright red earth; which, where it abounds, as in some parts of Ceylon, being blown about as a fine dust, imparts its hue to every neglected article, and to the dresses of the inhabitants. The redness of the streets and roads attracts the notice of every stranger at Galle and Colombo. L., however, is not always red. Its redness is supposed to be owing to the presence of iron in considerable quantity. When felspar preponderates in the gneiss, it is whitish; when hornblende preponderates, it is yellow.

LA'TÈS (*Lates Niloticus*), a fish of the perch family, one of the most delicate and best-flavoured fishes of the Nile. It grows to a large size, sometimes 3 feet long. It is mentioned by several ancient authors. In form it resembles a perch, and the genus is very nearly allied.—Another species of this genus is the **VACTI** (*Lates nobilis*), called *Cock-up* by the English in Calcutta, one of the most esteemed fishes of the Ganges, which it ascends as far as the tide does.

LA'TEX, in Botany, the sap of plants after it has been elaborated in the leaves. It returns from the leaves to the bark by vessels called *laticiferous vessels*, which branch, unite, and anastomose very

variously. They are not always of uniform thickness, but present many distentions, often almost as if articulated. Peculiar currents are observed in the *Lates*, which were first pointed out by Schultz, who has bestowed great attention on this subject, and on the branches of physiology connected with it. The L. differs very much in different plants, in colour and other qualities, but in all it is full of granules.

LATHAM, ROBERT GORDON, an eminent English philologist and ethnologist, was born in 1812, at Billingborough, Lincolnshire. He was educated at Cambridge, and took the degree of M.D., but having made a tour in Denmark and Norway, he was led to direct his attention particularly to the Scandinavian languages. For several years he was professor of the English Language and Literature in University College, London. As a physician, he has held important appointments. His well-known work, *English Language*, was published in 1841, and has gone through numerous editions. *The Natural History of the Varieties of Mankind* (Lond. 1850) is a valuable contribution to ethnology. Among his other works may be mentioned his edition of Tacitus's *Germania*, with philological and historical notes (1850); *Ethnology of the British Colonies*; *Man and his Migrations* (Lond. 1851); *Descriptive Ethnology* (2 vols. Lond. 1859); and *The Nationalities of Europe* (Lond. 1863). He is a F.R.S.L., and member of many learned societies in Europe and America.

LATHE. See **TURNING**.

LATHS AND LATHWOOD. Laths are small strips of wood of various lengths, rarely more than 4 feet; they are made either by splitting lathwood, which is the Norway spruce fir (*Pinus abies*), or else they are sawn from Canada deal. The sawn laths are a modern introduction, due to the development of steam saw-mills in Canada, which thus use up the small portions of the lumber. Laths are used for nailing to the uprights of partition-walls, and to the rafters of ceilings in our buildings; they are placed slightly apart to receive the plaster, which, by being pressed into the intervals between the laths, is retained, and when dry, is held securely on the wall. Slaters' laths are longer strips of wood, nailed on to the framework of the roof, for the purpose of sustaining the slates, which are fastened to the laths by nails.

LATHYRUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The leaves are furnished with tendrils, and are pinnate, but often only with one pair of leaflets. The species are numerous, annual and perennial herbaceous plants, natives of temperate countries in the northern hemisphere. Few of them are American. A number are natives of Britain. Some have very beautiful flowers of considerable size, on account of which they find a place in flower-gardens, as *L. latifolius* and *L. sylvestris*, the latter a native of England, and the former of the south of Europe, both perennials, and known by the name of **EVER-LASTING PEA**. The **SWEET PEA** (*L. odoratus*), a native of the East, is one of the best known ornaments of our flower-gardens, a hardy annual, esteemed not only on account of the beauty of its flowers, but of their delightful fragrance. Many varieties are in cultivation, differing in colour, &c. The most common British species is the **MEADOW VETCHLING** (*L. pratensis*), with bright yellow flowers. *L. sativus*, the **CHICKLING VETCH**, or **LENTIL** OF SPAIN, a native of the south of Europe, with flowers generally of a bright blue colour and winged pods, is cultivated in India and in Germany, France, and other countries for its seeds, the flour of which, however, is mixed with other flour rather than used

alone, on account of narcotic qualities which it possesses, and which caused its cultivation for food to be interdicted in Würtemberg in 1671. An incurable paralysis of the limbs has sometimes been produced by it, both in human beings and lower animals. The seeds of *L. cicera*, although sometimes used by the country people of France, are even more dangerous. Those of *L. Aphaca*, a species

Everlasting Pea (*L. tuberosus*).

sometimes found on gravelly soils in England, possess similar qualities when ripe, but in an unripe state are eaten with the pods which contain them, and are quite wholesome. *L. tuberosus*, a native of Germany and other parts of Europe, but not of Britain, is cultivated on the continent for its amyaceous tubers. The tubers are sometimes called *Dutch Mice*; in Germany, they are known as *Earth-nuts*. The herbage of the plant is relished by cattle.

LATIMER, HUGH, one of the most distinguished of the English reformers, was born at Thurstaston, in Leicestershire, in the year 1490 or 1491. He was educated at Cambridge, and after a brief period of zealous devotion to the papacy ('I was as obstinate a papist,' he says, 'as any in England'), he became attached to the new learning and divinity which had begun to establish themselves there. He very soon became a zealous preacher of the reformed doctrines. The consequence of this new-born zeal was, that many of the adherents of the old faith were strongly excited against him, and he was embroiled in many controversies.

The dispute about Henry VIII's marriage with Catharine of Aragon brought L. more into notice. He was one of the divines appointed by the university of Cambridge to examine as to its lawfulness, and he declared on the king's side. This secured Henry's favour, and he was appointed one of his chaplains, and received a living in Wiltshire. In 1535, he was appointed Bishop of Worcester; and at the opening of convocation on the 9th of June 1536, he preached two very powerful and impressive sermons, urging the necessity of reform. After a while, the work of reform rather retrograded than advanced, and L. found himself with his bold opinions in little favour at court. He retired to his diocese, and laboured there in a continual round of 'teaching, preaching, exhorting,

writing, correcting, and reforming, either as his ability would serve, or the time would bear.' This was his true function. He was an eminently practical reformer. During the close of Henry's reign, and when the reactionary party, headed by Gardiner and Bonner, were in the ascendant, L. lived in great privacy. He was looked upon with jealousy, and closely watched, and finally, on coming up to London for medical advice, he was brought before the Privy Council, and cast into the Tower.

On the accession of Edward VI., he again appeared in public. He declined, however, to resume his episcopal functions, although his old bishopric was offered to him at the instance of the House of Commons. He devoted himself to preaching and practical works of benevolence. The pulpit was his great power, and by his stirring and homely sermons, he did much to rouse a spirit of religious earnestness throughout the country. At length, with the lamented death of Edward, he and other reformers were arrested in their career of activity. L. was put in prison, and examined at Oxford in 1554. After his examination, he was transferred to the common jail there, where he lay for more than a year, feeble, sickly, and worn out with his hardships. Death would not have long spared the old man, but his enemies would not wait for the natural termination of his life. In September 1555, he was summoned before certain commissioners, appointed to sit in judgment upon him and Ridley; and after an ignominious trial, he was condemned to be burned. He suffered along with Ridley 'without Bocardo Gate,' opposite Balliol College, on the 16th of October 1555, exclaiming to his companion: 'Be of good comfort, Master Ridley, and play the man: we shall this day light such a candle, by God's grace, in England, as I trust shall never be put out.'

L.'s character presents a combination of many noble and disinterested qualities. He was brave, honest, devoted, and energetic, homely and popular, yet free from all violence; a martyr and hero, yet a plain, simple-hearted, and unpretending man. Humour and cheerfulness, manly sense and direct evangelical fervour, distinguish his sermons and his life, and make them alike interesting and admirable.

L.'s sermons were reprinted at London, in 2 vols., 1825. The latest edition is that by the Rev. G. E. Corrie, in 4 vols., 1845. Compare Tulloch's *Leaders of the Reformation* (1859).

LATIN CROSS, a cross with the lower limb considerably longer than the other three.

LATIN EMPIRE, the name given to that portion of the Byzantine empire which was seized in 1204 by the Crusaders, who made Constantinople their capital. It was overthrown by the Greeks in 1261. See **BYZANTINE EMPIRE**.

LATIN LANGUAGE AND LITERATURE.—*Language.*—The Latin language is a member of the great family commonly called Indo-Germanic, Indo-European, or Aryan. It is therefore closely allied to the Greek, Persian, German, Celtic, English, and many other tongues and dialects of Europe, and to all these its kindred is more or less clearly shewn by identity of stems and similarity of structure. It was primarily developed among the people who inhabited that part of Western Italy which lies between the rivers Tiber and Liris; and though the city of Rome stamped her name on the political institutions of the empire, yet the standard tongue of Italy still continued to be called the *Latin* language, not the Roman. As the Roman conquests extended, Latin spread with equal strides over the conquered countries, and was generally used by the educated classes in the greater part of Italy, in France, Spain, Portugal, Germany, and other Roman

provinces. But even in Italy itself, and in Latium, there seem to have been two forms of the language, differing very considerably from each other—a polished dialect and a rustic one—a language of books and of the higher classes, and a language of conversation and everyday life among the vulgar. It was in the last years of the Republic and the first of the Empire that the polished language reached its highest point of perfection in the writings of Cicero, Horace, Virgil, and others. But by the influx of strangers, by the gradual decline of Roman feelings and Roman spirit, and by the intermixture of the classic forms with the dialects of the provinces, it became corrupted, the process of deterioration going on with double rapidity after the dismemberment of the Roman Empire in the 5th century. Thus were formed the modern French, Spanish, Italian, and Portuguese. The English language also owes much to Latin, both directly by derivation from the classical forms, and at second-hand through the Norman-French. Latin continued to be the diplomatic language of Europe till a comparatively recent period. It is still the medium of communication among the learned of the world, and is now, as it has always been, the official language of the Roman Catholic Church.—For a discussion as to the origin and sources of the Latin language, see Donaldson's *Varronianus*.

The grammar of the Latin language has been studied and illustrated by many celebrated scholars from Varro (116–28 B.C.) down to Zumpt, Grotefend, Kuhner, and Madvig, through a long list of names, such as Donatus, Priscian, Laurentius Valla, Manutius, Melancthon, Scaliger, Perizonius, Schneider, Linacre, Ruddiman, Alvarez, and many more. In lexicography, Perotti, Stephanus, Faber, Gesner, Forcellini, Scheller, Freund, Georges, and others of less note, have done valuable service.

Literature.—The Roman Republic had well-nigh run its course ere it possessed a writer or a literature worthy of the name. A kind of rude poetry was cultivated from the earliest times, and was employed in such compositions as the Hymn of the Freres Arvales (dug up at Rome in 1778, and in the first burst of enthusiasm excited by its discovery, assigned to the age of Romulus), in the sacred songs to particular deities, and in triumphal poems and ballads, in the Fescennine Carols, and other rude attempts to amuse or dupe an illiterate and vulgar populace. And even when, in later years, the Romans did begin to foster a literary taste, the rage for Greek models hindered every effort at original thought. It was considered highly meritorious to imitate or translate a Greek writer; while, on the other hand, it was deemed dishonourable to follow a Latin author. Such was the feeling even in the days of Horace and Virgil, both of whom are largely indebted to their Greek models. The first period of Roman literature may be said to extend from 240 B.C. to the death of Sulla (78 B.C.); the second, or Golden Age, from the death of Sulla to the death of the Emperor Augustus (14 A.D.); the third, or Silver Age, from the death of Augustus to the death of Adrian (138 A.D.); and the fourth from the death of Adrian to the overthrow of the Western Empire in 476 A.D. In the first period, the most distinguished names are those of Livius Andronicus, a writer of dramas adapted from the Greek, whose first play was brought out in 240 B.C.; Ennius, whose chief work was an epic poem on the History of Rome, and who also wrote dramas and satires; with Nevius, Plautus, and Terence, the comedians. The second period is adorned by Varro, who wrote on agriculture, grammar, antiquities, &c.; by Lucretius, a writer of the didactic epic; by Virgil, who, to his great epic, the *Æneid*, added pastoral and agricul-

tural poetry in the *Eclogues* and *Georgics*; by Horace, in lyric verse and in satire; by Catullus, in lyric; by Tibullus and Propertius, in elegy; by Livy, Cæsar, Sallust, and Nepos, in history and biography; by Cicero, in philosophy, rhetoric, and oratory; and by Ovid, in elegiac and didactic poetry. The third period boasts of Tacitus, the historian and biographer; of the elder Pliny, the naturalist; of Persius and Juvenal, the satirists; of Martial, the epigrammatist; of Columella and Lucan, the didactic and epic poets; of Statius, Silius Italicus, and the younger Pliny, with many others of lesser note. The fourth period produced few men of name; but among those who are best known may be mentioned the Emperor M. Aurelius, Ammianus Marcellinus, Gellius, Justin, Appuleius, Lactantius, Eutropius, Macrobius, Calpurnius, Boethius, Paulinus, and Claudianus, the last of the Roman classic poets.

The spread of Christianity gave rise to the ecclesiastical poetry of the middle ages, which departed from the classic models, and struck out for itself a new type. It disregarded the restrictions of quantity and metre, and substituted accent and rhyme as the regulating principles of its form. The most famous name in the earlier period is that of Prudentius—to whom we may add Sedulius, St Hilary, St Ambrose, and St Gregory the Great; and in the later period, Fortunatus; the Emperor Charlemagne, author of *Veni Creator*; Bede (the Venerable); Bernard de Morley; Adam of St Victor; Thomas of Celano, author of the famous *Dies Ira*; James de Benedictis, author of the equally famous *Stabat Mater*; and St Thomas Aquinas.—See Bernhardt's *Roman Literature*, and Trench's *Sacred Latin Poetry*.

LATINI, an Italian people, who in pre-historic times had established themselves on the lower part of the Tiber and the Anio, between the sea and the nearest Apennines. The limits of their territory (**LATIUM**) cannot, however, be fixed with precision. The L. had the Volsci for neighbours on the south, the Æqui and Hernici on the east, and the Sabines on the north; but after the subjugation of these tribes by the Romans, the name of Latium was given to the whole of the conquered districts. The original and strictly ethnological Latium is called by Pliny, *Latium Antiquum*, and the newer and added portions, *Latium Adjutum*. The legend which forms the subject of the *Æneid*, the great national epic of the Romans, and which describes the introduction of a third or Trojan element in the persons of Æneas and his companions, possesses no historical value. The principal towns of the Latins were Laurentum, Lavinium, Alba Longa (q.v.), from which, according to the legend, went forth the founders of Rome, Ostia, Antium, Tusculum, Praeneste, and Tibur.

LATITAT, an old form of writ in England, which commenced an action in the Court of Queen's Bench; now obsolete.

LATITUDE AND LONGITUDE, in Geography, denote the angular distances of a place on the earth from the equator and first meridian respectively; the angular distance in longitude being found by supposing a plane to pass through the place, the earth's centre, and the poles, and measuring the angle made by this plane with the plane of the first meridian; the angular distance in latitude being found in the same manner, but substituting the two extremities of an equatorial diameter for the poles; or, more simply, latitude is the angle made by two lines drawn from the earth's centre—the one to the place, the other to the equator at the point where it is crossed by the meridian of the place. *Latitude*

is reckoned from the equator to the poles, a place on the equator having lat. 0°, and the poles 90° N. and 90° S. respectively. Longitude is reckoned along the equator from the first meridian; but as nature has not, as in the case of latitude, supplied us with a fixed starting-point, each nation has chosen its own first meridian; thus, in Great Britain and her colonies, in Holland, and other maritime states, longitude is reckoned from the meridian which passes through Greenwich; in France, from that through Paris, &c.; and in many old charts, from Ferro (one of the Canary Isles), or from the Madeira Isles. It is reckoned east and west from 0° to 180°, though astronomers reckon from 0° E. to 360° E., and never use west longitude. It will easily be seen that if the latitude and longitude of a place be given, its exact position can be determined, for the latitude fixes its position to a circle passing round the earth at a uniform fixed distance from the equator (called a parallel of latitude), and the longitude shews what point of this circle is to be intersected by the meridian of the place, the place being at the intersection.

The determination both of latitude and longitude depends upon astronomical observation. The principle on which the more usual methods of finding the latitude depend, will be understood from the following considerations: To an observer at the earth's equator, the celestial poles are in the horizon, and the meridian point of the equator is in the zenith. If now he travel northwards over one degree of the meridian, the north celestial pole will appear one degree above the horizon, while the meridian point of the equator will decline one degree southwards; and so on, until, when he reached the terrestrial pole, the pole of the heavens would be in the zenith, and the equator in the horizon. The same thing is true with regard to the southern hemisphere. It thus appears that to determine the latitude of a place we have only to find the altitude of the pole, or the zenith distance of the meridian point of the equator (which is the same thing as the complement of its altitude). The altitude of the pole is found most directly by observing the greatest and least altitudes of the polar star (see POLE), or of any circumpolar star, and (correction being made for refraction) taking half the sum. Similarly, half the sum of the greatest and least meridian altitudes of the sun, at the two solstices, corrected for refraction and parallax, gives the altitude of the meridian point of the equator. The method most usual with navigators and travellers is to observe the meridian altitude of a star whose declination or distance from the equator is known; or of the sun, whose declination at the time may be found from the *Nautical Almanac*; the sum or difference (according to the direction of the declination) of the altitude and declination gives the meridian altitude of the equator, which is the co-latitude. Other methods of finding the latitude require more or less trigonometrical calculation.

The determination of the longitude is by no means so readily accomplished. Various methods have at different times been proposed, most of which are only fitted for observatories. Among these may be classed those which depend upon the determination of the local time of the occurrence of certain celestial phenomena, such as the eclipses of the sun, moon, or Jupiter's satellites, occultations of fixed stars by the moon, the time occupied in the moon's transit over the meridian, &c.; and comparing the observed local time with the calculated time of the occurrence, at some station whose longitude is known (e. g., Greenwich), the difference of time when reduced to degrees, minutes, and seconds, at

the rate of 360° to 24 hours, gives the difference of longitude. The two methods in use among travellers and on board ship are remarkable for their combination of simplicity with accuracy. The first consists merely in determining at what hour on the chronometer (which is set to the time at Greenwich, or some place of known longitude) the sun crosses the meridian. It is evident that as the sun completes a revolution, or 360°, in 24 hours, he will move over 15° in 1 hour, or 1° in 4 minutes. Now, if the watch be set to Greenwich time—viz., point to 12 o'clock when the sun is on the meridian of Greenwich, and if at some other place, when the sun is on the meridian there, the watch points to 3 hours 52 minutes, the difference of longitude is 58°, and the longitude will be W., as the sun has arrived over the place later than at Greenwich; similarly, if the sun be over the meridian of a place at 9 hours 40 minutes A.M., the longitude is 35° E. (by the chronometer). The accuracy of this method depends evidently upon the correctness of time-keepers (see WATCHES). The other method—that of 'lunar distances'—may be briefly explained as follows: The distance of the moon from certain fixed stars is calculated with great accuracy (about three years in advance) for every three hours of Greenwich time, and published in the *Nautical Almanac*. The moon's distance from some one star having been observed, and corrected for refraction and parallax, and the local time having also been noted, the difference between this local time and that time in the table which corresponds to the same distance gives the longitude, which may be converted into degrees as before. It may also be mentioned, that the longitude of all places connected by telegraph with the reckoning-point can be easily found by transmitting from the latter a signal to an observer in the place, at a certain fixed time (reckoned in solar time at the reckoning-point), and by the observer instantly and accurately noting the local time at which the signal arrived; the difference of the two times, reduced in the way shewn above, will give the longitude, the time occupied in the transmission of the signal being so small as to be neglected. When applied to a heavenly body, the terms latitude and longitude have the same relations to the ecliptic and its poles, and to the point on the ecliptic called the Equinox (q. v.), that terrestrial latitude and longitude have to the equator and a first meridian. The positions of a heavenly body relatively to the equator are called its Declination (q. v.) and Right Ascension (q. v.).

LATOUR D'AUVERGNE, THÉOPHILE MALO CORRET DE, born 23d November 1743, at Carhaix in Finistère, France, of an illegitimate branch of the family of the Dukes of Bouillon. He entered the army in 1767; and in 1781 served under the Duke de Crillon at Port Mahon. On the outbreak of the Revolution, he attached himself to the national cause. The army of the Alps, which operated against the Sardinians in 1792, contained no braver officer than Latour. He was the first to enter Chambéry, sword in hand, at the head of his company. But he would not hear of advancement in military rank; and in the following year, though placed at the head of a column of 8000 grenadiers in the army of the Pyrenees, he continued to wear the uniform of a captain. His corps obtained the name of the 'infernal column,' on account of the dread which its bayonet-charges inspired. When he was subsequently with the army of the Rhine in 1800, as he still refused all promotion, Bonaparte bestowed on him the title of 'The First Grenadier of France.' He was killed, on 27th June of that year, at Oberhausen, near Neuburg in Bavaria. The heroism and magnanimity of L. were wonderful;

and French biographies are full of instances of his daring valour, his Spartan simplicity of life, and his chivalrous affection for his friends. When he died, the whole French army mourned for him three days; every soldier set aside a day's pay to purchase a silver urn to hold his heart; his sabre was placed in the church of the Invalides; and each morning, till the close of the Empire, at the muster-roll of his regiment, his name continued to be called, and the oldest sergeant answered to the call: '*Mort au champ d'honneur*' (Dead on the field of honour). L. was not only a brave warrior, but also a man of a studious disposition, and the author of two works, *Nouvelles Recherches sur la Langue d'Origine et les Antiquités des Bretons* (Bayonne, 1792), and *Origines Gauloises* (Hamb. 1801), which is, however, only a third edition of the former.

LA TRAPPE, a narrow valley in Normandy, in the department of Orne, closely shut in by woods and rocks, and very difficult of access. It is notable as the place in which the Trappists (q. v.) originated.

LATRINES, conveniences for soldiers in camps and barracks. Much attention has of late been devoted to their construction, a large percentage of the army sickness having been traced to their defective and impure condition.

LATTEN, a term now seldom used. It is applied to sheet-brass, and previous to the reforms in the Customs tariff, the name was regularly recognised. There are three varieties of latten known—black, chased, and roll. The first is rolled brass about the thickness of ordinary pasteboard, and unpolished; the second as thin as writing-paper; and the third is either of the other kinds polished on both sides. The term latten is of some archaeological interest, as it is not known what is meant by the 'mines of latten' mentioned in the time of Henry VIII., and frequent mention is made of this metal in various public records, without explanation of its nature.

LATTICE-BRIDGE, so called from having the sides constructed with cross-framing resembling lattice-work (Fr. and Ger. *lattice*, a lath). See FRAME-BRIDGE. Many very large bridges of this kind have been erected with timber-framing in America. That over the Susquehanna at Columbia is about one mile and a quarter long, and has twenty-nine spans, each 200 feet wide. The principle on which many lattice-bridges are constructed resembles that of the trussed rafters of roofs (A, B, C, fig. 1), with

Fig. 1.

a king-post or hanger in centre. Each span consists of a series of these rafters, so arranged that the head of one rafter (B) is immediately over the feet of the two adjoining rafters. Other lattice-bridges are constructed with diagonal braces, united with strong pins, and without suspension-rods. The former method is the stronger, as in the latter the strain comes chiefly on the pins uniting the diagonal cross-braces. Lattice-bridges are also constructed in iron, and have been much used for railway purposes. The first application of the lattice principle to iron was made by Mr George Smart, who registered, in 1824, his 'patent iron bridge.' Many modifications of the same principle have been adopted—the horizontal ties at top and bottom being always of wrought iron, and the di-

agonals either simple wrought-iron bars, or hollow malleable iron tubes, or of cast iron. The wrought-iron tubular bow-bridge, now in very common use in

Fig. 2.

railway construction, is a combination of the tubular and the lattice principle. See TUBULAR BRIDGE. Fig. 2 shows a portion of the lattice bridge over the Ouse at Lendal Ferry, York, as designed by Mr Dredge, C.E. The bridge has a clear span of 175 feet 6 inches.

LATTICE LEAF, LACE LEAF, WATER YAM, or OUVIRANDRANO (*Ouvirandra fenestralis*), a plant referred by some botanists to the natural order *Juncaginaceae*, and by some to *Najadaceae*. It is a native of Madagascar, and grows in running streams. It has a root-stock about the thickness of a man's thumb, six to nine inches long, often branching, internally white, with a light-brown skin, farinaceous, and used for food. The crown of the root is under water, and the leaves float just under the surface; the flower-stalks rise above it. The flowers are in forked spikes. The leaves are very curious; the blade resembling lattice-work or open needle-work of a most regular pattern; the longitudinal ribs being crossed at right angles by fine tendrils, and the intervening spaces being open. The blade is of an elongated oval form, abruptly acuminate; the length of the stalk varies according to the depth of the water. The whole appearance of the plant is very beautiful. It grows well in hothouse aquaria in Britain.

LATTICED, or TREILLÉ, in Heraldry, is a term applied to a shield covered with a decoration resembling fretty (q. v.), but differing in this respect, that the pieces do not cross over and under each other: those directed from dexter chief to sinister base are placed uppermost and *cloud*, that is, have nails inserted at the joints.

LAU'BAN, a town of Prussia, in the province of Silesia, is situated in a charming valley on the Queis, 40 miles west-south-west of Liegnitz. Pop. 6582, who are engaged chiefly in woollen, linen, and cotton weaving, bleaching, printing, dyeing, and bell-founding.

LAUD, WILLIAM, Archbishop of Canterbury, was the son of a clothier in good circumstances, and was born at Reading, in Berkshire, October 7, 1573. He entered St John's College, Oxford, in 1590, became a Fellow in 1593, and took his degree of M.A. in 1598. Ordained a priest in 1601, he soon

Latticed.

made himself conspicuous at the university by his antipathy to Puritanism; but being then a person of very little consequence, he only succeeded in exciting displeasure against himself. Yet his learning, his persistent and definite ecclesiasticism, and the genuine unselfishness of his devotion to the church, soon won him both friends and patrons. In 1607, he was preferred to the vicarage of Stanford in Northamptonshire, and in 1608 obtained the advowson of North Kilworth in Leicestershire. In both of these livings he shewed himself an exemplary clergyman according to the High-church pattern—zealous in repairing the parsonage-houses, and liberal in maintaining the poor. In 1609, he was appointed Rector of West Tilbury, in Essex; in 1611—in spite of strong opposition—President of St John's College; in 1614, Prebendary of Lincoln; and in 1615, Archdeacon of Huntingdon. King James now began to recognise what sort of a man L. was, and to see that he might rely on him as a valuable ally in carrying out his notions of the 'divine right.' Not that their aims were quite identical—James was chiefly anxious to maintain the absolute authority of the sovereign, and L. the absolute authority of episcopacy. In 1617, L. accompanied his majesty to Scotland, with the view of introducing episcopacy into the church-government of that country; but the attempt failed. In 1621, he was consecrated Bishop of St Davids. After the accession of Charles I., he was translated from the see of St Davids to that of Bath and Wells, became high in favour at court, was more than ever hated by the Puritans, and was denounced in parliament. In 1623, he was made Bishop of London. After the assassination of Buckingham (q. v.), L. became virtually the chief minister of Charles, and acted in a manner so utterly opposed to the spirit of the times and to the opinions of the great body of Puritans in England, that one might have foreseen his ruin to be inevitable, in spite of the royal favour. In 1630, he was chosen chancellor of the university of Oxford, the centre of High-church loyalty. From this period he was for several years busily but fruitlessly employed in repressing Puritanism. The means adopted were not only unchristian, but even detestable. Cropping the ears, slitting the nose, branding the forehead, fines, imprisonments, are not at any time satisfactory methods of defending a religious system, but in the then temper of the English nation they were in the last degree weak and foolish. In the High-commission and Star-chamber Courts, the influence of L. was supreme; but the penalty he paid for this influence was the hatred of the English parliament and of the people generally. In 1633, he was raised to the archbishopric of Canterbury, and in the same year made chancellor of the university of Dublin. The famous ordinance regarding Sunday sports, which was published about this time by royal command, was believed to be drawn up by L., and greatly increased the dislike felt towards him by the Puritans. His minute alterations in public worship, his regulations about the proper position of the altar and the fencing of it with decent rails, his forcing Dutch and Walloon congregations to use the English Liturgy, and all Englishmen to attend the parish churches where they resided, display a petty intellect and an intolerant spirit; as other of his actions indicate that there lurked in his small obstinate nature no inconsiderable amount of cruelty and malice. Still, it must be confessed that in the long-run, L.'s ritualism has triumphed. The Church of England was gradually penetrated with his spirit, and the high value which she has come to put on religious ceremonies is partly owing to the pertinacious efforts of the archbishop. This

influence, in short, has hindered her from becoming as doctrinal and *Calvinistic* as her articles would logically necessitate. During 1635—1637, another effort was made by him to establish episcopacy in Scotland; but the first attempt to read the liturgy in St Giles's Church, Edinburgh, excited a dangerous tumult. Proceedings were finally taken against him, and on the 1st of March 1640—1641, he was, by order of the House of Commons, conveyed to the Tower. After being stripped of his honours, and exposed to many indignities and much injustice, he was finally brought to trial before the House of Lords, November 13, 1643, on a charge of treason and other crimes. The Lords, however, did not find him guilty; but the Commons had previously resolved on his death, and passed an ordinance for his execution. To this the Upper House gave its assent; and in spite of L.'s producing a royal pardon, he was—undoubtedly in violation of express statute, and by the exercise of a prerogative of parliament as arbitrary as any king had ever exhibited—beheaded, 10th January 1644—1645. L. had a genuine regard for learning—at least ecclesiastical learning—and enriched the university of Oxford, in the course of his life, with 1300 MSS. in different European and Oriental languages; but his exclusive sacerdotalism, his inability to understand his fellow-creatures, and his consequent disregard for their rights, forbid us to admire his character, though we pity his fate. His writings are few. Wharton published his *Diary* in 1694; and during 1857—1860, Parker, the Oxford publisher, issued *The Works of the Most Reverend Father in God, William Laud, D.D., sometime Lord Archbishop of Canterbury*, containing, among other things, his letters and miscellaneous papers, some of them not before published, and, like his *Diary*, of great value in helping us to form an adequate conception of the man and his time.

LAUDANUM, or TINCTURE OF OPIUM, is the most generally used of all the preparations of opium. It is obtained by macerating the sliced or powdered drug in spirit, and filtering. It is of a deep brownish-red colour, and possesses the peculiar odour and smell of opium. One of the greatest objections to it is, that it is liable to great variations of strength. Dr Christison remarks: 'Laudanum is made by all the colleges with such proportions of the opium and spirit that about thirteen minims and a half, or about twenty-five drops, contain the entire part of one grain of opium. But the London tincture may be sometimes sixteen per cent. stronger than the others, as dry opium is directed to be used.' This medicine is, moreover, very often adulterated.

Laudanum is a powerful anodyne and soporific, but is more liable to cause headache than the solution of one of the salts of morphia. Its general action and its uses will be described in the article OPIUM. The dose for an adult varies from ten minims to a drachm. To children (as is the case with all opiates), it must be given with extreme caution. One minim, which is equivalent to the 120th of a grain of morphia, has been known to prove fatal to an infant.

LAUDS. See CANONICAL HOURS.

LAU'ENBURG, or SAXE-LAUENBURG, a duchy belonging to the German confederacy, but united with the crown of Denmark. In the earlier half of the thirteenth century, it fell into the possession of the Duke of Saxony, one of whose sons became the founder of the ducal House of Saxe-Lauenburg. After the extinction of this line, it was inherited by the Duke of Brunswick-Celle in 1689, and passed into the possession of the

Hanoverian kings of Great Britain, was seized along with Hanover by the French in 1803, and afterwards, with some changes of boundary, was made over to Prussia, and by Prussia transferred to Denmark, but with reservation of all the rights and privileges of the country. It has an area of 400 square miles, and (in 1860) 50,147 inhabitants, lies on the right bank of the Elbe, and borders with Hanover, Mecklenburg, Holstein, and the territories of Hamburg and Lübeck, and is a well-cultivated and fertile country. It is closely connected in political affairs with Holstein. The capital, Lauenburg, has only about 1100 inhabitants: the two largest towns are Ratzeburg (pop. 3760), and Mülin (pop. 3322).

LAUGHING GAS. See NITROGEN.

LAUGHTER—THE LUDICROUS. This familiar and peculiarly human expression has been the occasion of a good deal of discussion and controversy, being connected with a large and important class of effects, named the ludicrous, and also with wit and humour. We shall first advert to the physical part of the phenomenon, and then consider the mental causes or accompaniments of it.

Physically, laughter is a convulsive action of the Diaphragm (q. v.). In this state, as remarked by Sir Charles Bell, the person 'draws a full breath, and throws it out in interrupted, short, and audible exhalations.' This convulsion of the diaphragm is the principal part of the physical manifestations of laughter; but there are several accessories, especially the sharp vocal utterance arising from the violent tension of the larynx, and the expression of the features, this being a more intense form of the smile, the characteristic of pleasing emotions generally. In extreme cases, the eyes are moistened by the effusion from the lachrymal glands.

The causes of laughter are both *physical* and *mental*. Among physical causes, we must rank first hilarity, or animal spirits generally. When there is a great overflow of good spirits, it takes the form of the laugh among other violent manifestations. The rebound of robust natures from constraint or confinement, as when children are released from school, is marked with uproarious glee and excitement. Laughter is sometimes produced by the application of cold, as in the cold bath. Another notable form is the hysterical fit, where the explosiveness of the nervous system is an effect of disease, and followed by exhaustion.

The *mental* causes of laughter are what have given rise to the controversy. To determine the common characteristic of all those things termed 'ludicrous,' has been found a problem of no common difficulty. Various theories have been propounded, all with some truth, but perhaps none entirely explaining the facts. Aristotle lays it down that 'the ridiculous implies something deformed, and consists in those smaller faults which are neither painful nor pernicious, but unbecoming—thus, a face excites laughter wherein there is deformity and distortion without pain.' Here he touches upon several of the important conditions—viz., that there should be some strangeness or deviation from the ordinary appearances of nature, that this deviation should be on the side of degradation or inferiority, and that it should not be of a kind to excite any other strong emotion, as pity. Hobbes has given a theory to the effect that laughter is 'a sudden glory, arising from a sudden conception of some eminency in ourselves by comparison with the infirmity of others, or with our own formerly.' This evidently suits a certain number of cases, especially the laugh of ridicule, derision, and contempt. It would not be so easy to reconcile it with the humorous and genial laughter

of those that are but little given to self-glorification or proud exultation over other men's discomfiture. Partly owing to this deficiency, and partly from the harsh judgment of human nature implied in it, this theory has been very unpopular. It has been contended, in opposition to Hobbes, that there are *jests* that do not imply the degradation of any living being; and that we often feel contempt for others, and sudden glorying in ourselves by the comparison, without being urged to laughter. As to the first of these allegations, Campbell, in the *Philosophy of Rhetoric*, adduces the following instance: 'Many,' he says, 'have laughed at the queerness of the comparison in these lines (from *Hudibras*):

For rhyme the rudder is of verses,
With which, like ships, they steer their courses,

who never dreamed that there was any person or party, practice or opinion, derided in them.' But in addition to the agreeable surprise caused by the novelty of the comparison, which is the chief ingredient in wit, and may exist without any degradation of the subject, there is here a most apparent degradation of the poetic art, hallowed as it is in men's minds by the most dignified associations as something akin to divine inspiration, and now reduced to a vulgar mechanism of rhyme-making. Hobbes confines his definition too much to actual persons; for the laugh may be raised against classes, parties, systems, opinions, institutions, and even inanimate things supposed to be personified. It would not be easy to produce any unequivocal instance of a laugh raised without degrading some person or interest, while in a vast number of cases this circumstance is the indispensable and admitted condition of the effect.

Dr Campbell himself, while challenging the theory of Hobbes, substitutes nothing in its place except an enumeration of the most prominent kinds of ludicrous effects. These are, first, the debasement of things great and eminent; secondly, the aggrandisement of little things by the language of splendour; and thirdly, the queerness or singularity of the imagery. Now, as regards the first of these, the debasement of things eminently great—by far the largest class—the doctrine of Hobbes, if properly guarded, would be found fully applicable. There is a strong satisfaction in pulling anything down from a high pinnacle to plunge it in the mire, which we can interpret only as a mode of the sentiment of Power, one of the most energetic and deep-seated passions of the human mind. This sentiment is gratified by every striking effect that we can produce ourselves; and few effects are more striking than to debase or humiliate some person or interest from a proud eminence; and not only so, but (what Hobbes neglected to remark) also by seeing the effect produced by the agency of some other person. A familiar mode of pandering to the sense of power is to put any one to fright; even the child can chuckle over this triumph of its young ability. Campbell's second class of cases might seem at first sight to be the opposite of the first, and thereby to contradict the general theory which that illustrates. But when mean and little things are aggrandised, by elevated phraseology, so as to raise a laugh, it will always be found that the effect is owing, not to the raising of the subject, but to the degrading of the language by connection with such a subject. This is the so-called *mock-heroic*, where the grand and the lofty in speech being employed upon the mean and insignificant, are debased to the level of what they are applied to. Such is the nature of *parody*. So that, in fact, Campbell's second species are merely a variety of the first. The third species, marked by 'queerness and singularity of imagery,' are really

nondescript, but on analysis always yield more or less of the element of implied littleness or meanness in a subject usually held great or dignified.

In short, if we carefully set aside the element of the witty, we shall generally be able to explain the production of laughter upon a uniform principle. Every one would probably allow that nine cases out of every ten of the genuinely ludicrous are cases of the pleasure of degrading something, which furnishes a considerable presumption that the remainder are of the same general character, although perhaps enveloped with circumstances that disguise the fact. The figures of a powerful imagination, the resources of learning, and the polish of rhetorical art, may enter into a ludicrous combination. Such we have in the works of the great comic writers—in the plays of Aristophanes, Molière, and Shakspeare, and in the humour of Cervantes, Addison, Swift, and Sydney Smith—but wherever there is no expressed or implied degradation of some characters, classes, opinions, or institutions, we shall probably not experience the proper delight of the ludicrous.

LAUNCE (*Anmodytes*), a genus of fishes, of the eel tribe, with very elongated body, elongated head, large gill-openings, dorsal fin extending nearly the whole length of the back, anal fin also long, tail-fin distinct from them both, and forked. Two species are common on the British coast, often called SAND-EEL, a name which, in some books of natural history, is restricted to the larger and less abundant of them (*A. Tobianus*), a fish about a foot long,

Sand Launce (*A. lancea*).

the *Hornel* of the Firth of Forth. The smaller species (*A. lancea*), about five or six inches long, is much used as bait by fishermen. Both are, however, very delicate and palatable. They are of a beautiful silvery colour. The under jaw projects beyond the upper, and is used in burrowing in the sand, to which these fishes retreat when the tide retires. They are obtained by digging in the sand, or by a kind of rake, or by nets drawn along the sand, when it is covered by the sea.

LAUNCESTON, the second town of Tasmania, or Van Diemen's Land, is to the north of the island what Hobart Town, the capital, is to the south—the chief port of entry and mart of trade. It stands at the junction of the Esk with the Tamar, which, after a course of 32 miles, enters Bass's Strait (q. v.) at Port Dalrymple. It is accessible to ships of considerable burden, and carries on a thriving commerce with the colonies of Victoria and South Australia. Among the principal buildings are a church, a government-house, a court-house, a jail, a college, a bank, barracks, and schools. The population is upwards of 6000. In 1860, 881 vessels, of 98,180 tons, entered and cleared the port. The imports, amounting in 1860 to £442,792, consist of manufactured goods, tea, sugar, &c. The exports in the same year amounted to £483,908, the chief articles being wool, oats, wheat, flour, timber, potatoes, horses, fruits. In the surrounding district of the same name rises Benlomed, to the height of 4500 feet.

LAUNCESTON, a parliamentary and municipal borough of England, formerly the capital of the county of Cornwall, is situated on the Kensey, a tributary of the Tamar, 21 miles north-east of Bodmin. It is a very old town; its castle was held of the Conqueror by the Earls of Moreton. It unites with the borough of Newport in sending a member to the House of Commons. The county assize formerly held here is now held at Bodmin. Pop. (1861) of municipal borough, 2790.

LAUNCH, the largest boat belonging to a ship. The launch has nearly superseded the long-boat, formerly the principal of a ship's boats. It is rowed by a considerable number of oars, double-banked, and has capabilities for sailing well, and for stowing several days' provisions. The launch of a man-of-war is frequently armed with a small piece of artillery in the bow; and when the ship is employed in narrow seas or rivers, it is not unusual for the launch to be despatched on expeditions far from the ship, and to points which she is unable herself to reach.

LAUNCH is the process of removing a vessel, especially a new one, from land to water. A ship is ordinarily built upon a wooden slip, which is an inclined plane (rising about 625 in 12), with one end reaching below the surface of the water to a depth greater than the ship's draught. The keel is built, not upon the slip itself, but on blocks of wood about three feet or less apart, standing on the slip. To maintain the hull in equilibrio while building, it rests in a *cradle*, the bottom of which is supported by the *ways* on the slip, planed timbers leading towards the water. A section crosswise of a ship in this position is shown in the annexed figure. The time for launching having arrived, the ways are well greased, the *shores* and *stanchions* which hold the ship in place are knocked suddenly away, a bottle of wine is broken over the bow by some 'lady fair,' who gives the name, and the vessel glides down, *stern foremost*, into the water. The cradle is so formed that the weight of the vessel holds it together; but when that is withdrawn through the buoyancy of the water, the cradle breaks up into many pieces, and is recovered by boats in attendance.

cc, cradle; dd, ways.

The famous *Great Eastern* was built at Blackwall with the side parallel to the river, and launched over numerous iron rails; but owing to the bite of the iron keel upon the rails, it took three months' exertion, with the aid of the most powerful hydraulic rams, to push the immense ship (12,000 tons weight) into the river (January 31, 1856).

LAURACEÆ, a natural order of exogenous plants, consisting of trees or shrubs which have leaves without stipules, and flowers in panicles or umbels. The perianth is 4–6-cleft; the stamens opposite to its segments, and twice as many. The fruit is a one-seeded berry or drupe; the fruit-stalk often enlarging and becoming fleshy.—This order contains about 450 known species, mostly tropical. The Laurel (q. v.) is the only European species. An aromatic and fragrant character pervades the order, and amongst its products are cinnamon, cassia, and other aromatic barks, also a number of aromatic fruits somewhat resembling nutmeg. See NUTMEG. The timber of some species, as greenheart, is valuable; some are valuable for their medicinal barks, as greenheart (bebeeri) and samaras; some for their secretions, of which camphor is the most important. *Oreodaphne opifera*, a

South American tree, yields a camphoraceous volatile oil in great quantity, if mere incisions are made in its bark. The fruit of some species is agreeable, as the Avocado Pear (q. v.).—A few very remarkable species, forming the genus *Cassytha*, have been united with this order by many botanists, although others separate them as a distinct order. They are climbing parasites, like dodders, and inhabit the woods of the hottest parts of the globe.

LAUREATE, *Porr.*, is an officer of the household of the sovereigns of Great Britain. The appellation seems to have originated in a custom of the English universities of presenting a laurel wreath to graduates in rhetoric and versification; the new graduate being then styled *Poeta Laureatus*. The king's laureate was then simply a graduated rhetorician in the service of the king. R. Whittington, in 1512, seems to have been the last man who received a rhetorical degree at Oxford. The earliest mention of a poet-laureate in England occurs in the reign of Edward IV., when John Key received the appointment. In 1630, the first patent of the office seems to have been granted. The salary was fixed at £100 per annum, with a tierce of canary; which latter emolument was, under Southey's tenancy of the office, commuted into an annual payment of £27. It used to be the duty of the laureate to write an ode on the birthday of the sovereign, and sometimes on the occasion of a national victory; but this custom was happily abolished towards the conclusion of the reign of George III. The following poets have held the office of laureate since the year 1670: John Dryden, Nahum Tate, Nicholas Rowe, Laurence Eusden, Colley Cibber, William Whitehead, Thomas Warton, Henry James Pye, Robert Southey, William Wordsworth—the office being at present held by Alfred Tennyson.

LAUREL (*Laurus*), a genus of *Lauraceae* (q. v.), which, as now restricted, contains only a single known species, the Noble L., Victor's L., or Sweet Bay (*L. nobilis*), a native of Asia Minor, but now diffused over all the countries around the Mediterranean Sea. It is often a mere bush of fifteen feet or less, but sometimes becomes a tree of thirty, or even sixty feet high. It has rather large, lanceolate, leathery, shining leaves, reticulated with veins, and axillary clusters of yellowish-white flowers of no beauty. The fruit is oval, bluish-black, and about half an inch long. Both the leaves and the fruit are bitter, astringent, and agreeably aromatic, and were formerly much used in medicine as a stomachic and stimulant, but are now almost out of use. The leaves, however, are still used in cookery for flavouring. They contain a volatile oil (*oil of sweet bay*), and a bitter, gummy extractive.

By the ancient Greeks, the L. was called *daphne*; it was sacred to Apollo. Berry-bearing twigs of it were wound round the forehead of victorious heroes and poets; and in later times, the degree of Doctor was conferred with this ceremony—whence the term *laureation*; and, according to some, the term *Bachelor* (q. v.). And to this day, a L. crown is the emblem of the honour to which poets, artists, and warriors aspire.

The Noble L. is common in shrubberies in Britain, but not nearly so common as the species of Cherry-laurel (q. v.), which share with it the name L., as do not a few other shrubs botanically very different, but somewhat similar in their evergreen foliage.

LAUREL-WATER is obtained by distilling a mixture of chopped and bruised leaves of the cherry-laurel and water, after 24 hours' maceration. It is seldom prescribed medicinally in this country, but may be given in doses of from half a drachm to a drachm as a sedative narcotic, in

neuralgic pains, spasmodic cough, and palpitation of the heart; in short, in all the cases in which hydrocyanic is applicable. Death has occurred, with all the symptoms of hydrocyanic poisoning, from its incautious use as a flavouring ingredient in creams and puddings.

LAURENTIAN SYSTEM, a series of highly metamorphosed rocks, older than the Cambrian, and apparently the fundamental series of the stratified rocks. They have been so named from their covering the whole country north of the St Lawrence, where they were originally described by Sir William Logan. They consist of hornblende and micaceous gneiss, alternating with or passing into mica-schist, the whole being considered to have been originally sedimentary deposits, and to have been thus altered by long-continued metamorphic action. A few large, irregular beds of crystalline limestones, and bed-like masses of magnetic oxide of iron and other minerals, are interstratified with the gneiss. True igneous rocks are frequently intruded among these strata, as veins and masses of granite, syenite, and greenstone. The beds are highly inclined and greatly contorted, so that no approximate estimate can be made of their thickness, which seems to be very great. Murchison and Geikie have lately determined that certain great masses of highly crystalline gneiss, which underlie the Cambrian Series in the north of Scotland, belong to this period. It is probable that some of the highly metamorphosed rocks of the north of Ireland may be of the same age.

LAURUSTINUS (*Viburnum Tinus*, see *VIBURNUM*), a shrub very frequent in pleasure-grounds in Britain, a native of the south of Europe and the north of Africa. It is a beautiful evergreen, with dark, shining, leathery leaves, small whitish flowers in corymbes, and small blackish-blue berries. The flowers appear in winter or very early spring. The berries have drastic purgative properties; they are very acrid, and inflame the mouth violently, yet some kinds of birds eat them with avidity. The L. cannot endure much frost; and in Germany and the northern parts of the United States, it is a green-house plant.

LAUSANNE (Lat. *Lovana*), a city of Switzerland, capital of the canton of Vaud, is picturesquely situated on the southern slope of the Jura Mountains, close to the northern shore of the Lake of Geneva, on which the village of Ouchy forms its harbour. The two principal parts of the city are separated by a valley, across which a fine bridge has been recently thrown. L. has a number of religious, educational, and scientific institutions. The cathedral, a beautiful Gothic building, begun in the 10th c., and completed in the 13th, is the greatest ornament of the city. L. is much frequented by visitors from all parts of the world. Here Gibbon resided for many years, and the house in which he wrote the greater part of the *Decline and Fall* is still shewn. John Kemble the actor is buried in a cemetery in the vicinity. Brewing, lithographing, and cotton and wool spinning are the principal branches of trade. Pop. 18,000, of whom 1000 are Roman Catholics.

LAVA, a name sometimes applied generally to Volcanic Rocks (q. v.), but more strictly confined to those rocks which have been poured out as a stream of molten matter from a volcanic opening, either on dry land or in shallow water. The surface of the stream, which speedily cools and hardens, is generally quite porous and vesicular, from the escape of the confined gases; but as rock is always a bad conductor of heat, the interior often remains long in a liquid condition, permitting the continued

flow of the stream sometimes to a very great distance from the orifice from which it has been discharged, notwithstanding its indurated covering. The end of the stream is a slowly-moving mass of loose porous blocks, rolling and tumbling over each other with a loud rattling noise, being pushed forward in fits and starts by the viscid lava, when it bursts the hardened crust and rushes on. The structure of the interior of a solid lava-stream shews a compact and homogeneous rock, assuming a more and more crystalline structure as the cooling has been the work of a longer or shorter period of time. Caverns are sometimes formed in lava-streams by the escape of the molten mass below, leaving the cooled crust standing like the roof of a tunnel.

LAVAL, an ancient and picturesque town of France, capital of the department of Mayenne, is situated on the river Mayenne, 42 miles east of Rennes. Its chief building is an old château, now a prison, and formerly the residence of the Dukes of La Tremouille. For 500 years, this town has been celebrated for its linen manufactures, which are exported from, as well as sold throughout France. Cottons, calicoes, serge, soap, and leather are also manufactured, and there is a considerable trade in grain, wool, timber, and iron. In the vicinity of L. the Vendéens under Larochejaquelein gained a brilliant victory over the Republicans, who lost 12,000 men and 19 cannon in the engagement. Pop. 21,300.

LA VALETTA. See VALETTA, LA.

LA VALLIÈRE, FRANÇOISE LOUISE DE LARAUME LEBLANC DE, a celebrated mistress of Louis XIV. of France, was born at Tours, in 1644, of an ancient and noble family. At an early age, she lost her father, and was brought to court by her mother, who had married a second time. She was not a great beauty, and had a slight lameness; but her amiability and winning manners, and, above all, the extraordinary sweetness and tenderness expressed in her looks, rendered her very attractive. It is seldom that one can do more than praise the face of a king's mistress, but this singular creature was characterised by an extreme, we might almost say a morbid delicacy and modesty. She really loved Louis, and bore him four children, of whom two died in infancy; but although she and they received wealth and titles of honour, she remained always extremely sensible of the disgrace of their birth. When Madame de Montespan became the royal favourite, she retired into a Carmelite nunnery in Paris, where she took the veil in 1674. She died 6th June 1710, after having spent more than 30 years in penances and religious austerities. She wrote a work entitled *Réflexions sur la Miséricorde de Dieu* (Paris, 1680), of which a copy, dated 1688, with corrections by Bossuet, was discovered in the Louvre in 1852. Both have been edited by M. Romaine Cornut (Paris, 1854). A collection of her letters was published in 1767.

LAVATER, JOHANN KASPAR, born on the 15th November 1741 at Zürich, was the son of a physician. As a boy, he was by no means distinguished for his talents; but in 1762, whilst yet a youth, he gave a signal proof of his energy and courage in coming forward, along with Henry Fuseli, to accuse the landvoigt Grebel of oppression and injustice, under which others had groaned without daring to complain. He early gained a high reputation by a volume of poems, entitled *Schweizerlieder* (Bern, 1767). His next publication was *Ausichten in die Schweiz* (3 vols. Zür. 1768—1773), of which several editions were soon called for. The tone of this work is that of high religious enthusiasm, mingled with

asceticism. He filled in succession several ecclesiastical offices in his native city, and finally, in 1786, became minister of the church of St Peter there. His powers of observation were very keen, and his discrimination of character most delicate, and believing that he could discover much of men's characters from their countenances, he concluded that Physiognomy might come to be reckoned among the sciences. He laboured, therefore, to form a system of physiognomy, hoping thus to promote greatly the welfare of mankind, and at last he published the work to which he owes the chief part of his celebrity, *Physiognomischen Fragmente zur Beförderung der Menschenkenntniz und Menschenliebe* (4 vols., Leip. and Winterth. 1775—1778). This work, which has often been reprinted and translated, is written in an inflated style. It gave rise to much discussion, and occasioned not a little display of wit and humour. L. himself appears latterly to have been convinced that his system was fanciful. But he was of a highly imaginative temperament, and the religious orthodoxy which he firmly retained was incongruously combined with novel speculations and with superstitious notions. He was the chosen spiritual adviser of many persons both in Switzerland and Germany, with whom he maintained an unwearied correspondence. On his tours in Germany he received extraordinary marks of popular esteem and honour. When the French Revolution began, L. hailed it with joy; but after the murder of the king, he regarded it with religious abhorrence. In performing kind offices to some wounded persons on the street at the capture of Zürich by Massena, 26th September 1799, he received a wound, of the effects of which he died, after long suffering, 2d January 1801.

LAVAUUR, a town of France, in the department of Tarn, is situated on the left bank of the Agout, 20 miles north-east of Toulouse. Its manufactures are cotton-yarn, leather, and silk. Pop. 7330.

LA VENDER (*Lavandula*), a genus of plants of the natural order *Labiata*, having the stamens and style included within the tube of the corolla, the corolla two-lipped, the upper lip bifid, the lower trifid.—The COMMON L., or NARROW-LEAVED L. (*L. vera* or *L. angustifolia*), grows wild on stony mountains and hills in the south of Europe, and in more northern regions is very generally cultivated in gardens. It has a delightful aromatic fragrance, and an aromatic bitter taste, and contains a great quantity of a volatile oil, *oil of lavender*. The whole plant possesses stimulant properties, and is used in medicine, but particularly the spikes of the flowers, as a tonic, stomachic, nervous stimulant, &c. L. flowers are often put into wardrobes to keep away moths. They are much used in perfumery. *Oil of L.* is procured by distillation of L. flowers with water. It requires 70 lbs. of flowers to yield 1 lb. of oil. It is rather lighter than water, pale yellow, very fluid, and very fragrant. *Spirit of L.* is made by distilling L. flowers with rectified spirit; *L. water*, one of the most popular of all perfumes, by dissolving oil of L. with smaller quantities of other volatile oils in rectified spirit. L. is extensively cultivated for its flowers in some places near London, and particularly at Mitcham in Surrey, where more than 200 acres are occupied by it, the light and sandy soil being especially suitable to it.—BROAD-LEAVED L. (*L. latifolia* or *L. spica*) is also a native of the south of Europe, but is more tender than common lavender. It is also less fragrant, and the oil which it yields is called *Oil of Spike*, and sometimes *Foreign Oil of Lavender*. This oil is used by painters on porcelain, and in the preparation of varnishes.

LAVER, a name given to a number of kinds of sea-weed, which are used as food, especially *Porphyra vulgaris* and *P. laciniata*, of the sub-order *Conserveacea*, and nearly allied to the genus *Uva*. These plants grow on rocks and stones in the sea, and are not unfrequent on the British shores. They consist of a very thin flat purple frond, which is not gelatinous. The frond of *P. vulgaris* is wavy and undivided, that of *P. laciniata* (sometimes called **SLOKE**) is deeply cleft, and has the segments lobed and cut at the edges. L. is stewed and brought to table as a luxury; also pickled and eaten with pepper, vinegar, and oil, or with lemon juice. It is regarded as useful in scrofulous affections and glandular tumours, a property which it probably owes to the iodine which it contains.—The name of **GREEK L.** is given to *Uva latissima*, a common sea-weed of the British shores, the frond of which is green, membranous, broad, flat, wavy, and sometimes inflated. It is bitterish, but is often used in the same way as the true L., and possesses similar properties.

LAVISH PERSONS. See **INTERDICTION.**

LAVOISIER, **ANTOINE LAURENT**, the founder of the antiphlogistic or modern chemistry, was born in Paris, August 1743, and devoted himself to scientific, and particularly to chemical studies, to obtain the means of more fully prosecuting which, he accepted, in 1769, the office of farmer-general. In 1768, he was made an academician; in 1776, discovered a way of greatly improving the quality of gunpowder; and made other beneficial discoveries in economics, and in the application of chemistry to agriculture. Availing himself of the discoveries of Black, Priestley, and Cavendish, and making many experiments and discoveries himself, he was led to connect the recently discovered gas, oxygen, with the phenomena of combustion and of acidity; and in 1783, he proved that water can be formed by burning oxygen and hydrogen together, and that it can be decomposed into the same elements. He and his associates invented a new chemical nomenclature, adapted to the advanced state of the science, which was very generally adopted. See **CHEMISTRY**, and **CHEMICAL NOMENCLATURE**. L.'s services to science could not save him from the popular rage directed against farmers of the taxes during the Reign of Terror, and he died by the guillotine, 8th May 1794. His principal work is his *Traité Élémentaire de Chimie* (2 vols., Paris, 1789); but of course all his chemical works are now interesting merely as marking the history of the science.

LAW, in Theology, a term variously used. In the Bible, it often includes the whole of revelation, doctrinal as well as preceptive; but it is often also used, in a more restricted and somewhat conventional sense, to signify the books of Moses, the whole Jewish scriptures being comprehended under the twofold designation of 'the law and the prophets.' A very natural and common use of the term law is to denote the preceptive part of revelation, in contradistinction to the doctrinal, the one being designated as the law, and the other as the gospel. When employed in scripture with exclusive reference to the preceptive part of revelation, the term law sometimes signifies the Jewish code of precepts as to rites and ceremonies, called by theologians the **CEREMONIAL LAW**, and which is regarded as having been abrogated when the Jewish dispensation gave place to the Christian. The ceremonial law is also regarded as having in its rites and ceremonies—'a shadow of good things to come'—symbolised the great doctrines which form the system of Christianity.—The **MORAL LAW** is that preceptive revelation of the divine will which is of perpetual

and universal obligation. It is commonly regarded by theologians as summed up in the *Ten Commandments*; and, according to our Saviour's own statement, as still more briefly and comprehensively summed up in the two commandments of loving God with all our heart, and soul, and strength, and mind, and loving our neighbours as ourselves. Although the *Ten Commandments* were given to the Jews at Mount Sinai, it is not therefore held that they were intended for the Jews alone, or were then first promulgated; the moral law being regarded as really the law of nature, written on the heart of man at his creation, although to fallen man a clear and express revelation of it has become necessary. One of the chief contested points in connection with this subject is that of the Sabbath (q. v.). Another relates to the law of nature, and the value which ought to be practically assigned to the decisions of the judgment and conscience of man, apart from express revelation.—The obligation of the moral law on the consciences of Christians is admitted by all except Antinomians (q. v.).

LAW has been variously defined. Blackstone says it means the rules of human action or conduct. This definition is too wide, for it is confined only to such rules as courts, supported by proper authority, will enforce. The law of nature consists of those laws which are common to all mankind, and are supposed to be, as nearly as can be conjectured, independent of the accidents of time and place. The civil or municipal law of a nation is what is commonly understood by the term law, when applied to a particular country. The 'Civil Law' is also sometimes used *par excellence* to denote the old Roman Law as embodied in the *Institutes* of Justinian, the *Code*, and other parts of what is commonly called the *Corpus Juris Civilis*. Many of the leading doctrines of that law have been adopted by modern nations. England is the civilised country which has adopted the least from that code of law, while Scotland follows the continental nations in adopting the Roman or Civil Law to a large extent, and on many subjects in adopting it entirely. The law of nations is subdivided into public International Law (q. v.) and private international law, or the *comitas gentium*. Law is often used in England as contradistinguished from equity, but this is chiefly due to the accidental circumstance, that there is a subdivision of courts into courts of law and equity, according to the nature of the remedy given. See **JURISPRUDENCE**, **INTERNATIONAL LAW**, **CHANCERY**. Law is also often in popular parlance distinguished from justice, the latter being supposed to be perfect in its nature, or as near the standard of perfection as can be supposed; whereas there are numberless cases of injury, hardship, and oppression, which, owing to human infirmity, no system of human laws can adequately redress; and this is often adduced as confirmation of the doctrine of future rewards and punishments. Law is also sometimes subdivided into criminal law, constitutional law, &c., according to the particular subject-matter.

LAW, ROMAN or CIVIL. See **LAW.**

LAW, WILLIAM, an influential religious writer of last century, was born at Kingsliffe, Northamptonshire, in 1686, and educated at Emmanuel College, Cambridge, where he took his degree of M.A. in 1712. He was for some time tutor to Edward Gibbon, father of the historian, who speaks of his piety and talents with unusual warmth. About 1740, two of his friends, Miss Hester Gibbon, sister of his pupil, and Mrs Hutcheson, widow of a London barrister, having resolved to retire from the world, and devote themselves to works of charity and a

religious life, chose L. for their almoner and instructor. The ladies settled at Kingscliffe, and here L. died, April 9, 1761. L.'s writings are deeply tinged with what is commonly called mysticism. His principal work is his *Serious Call to a Devout and Holy Life* (1729), a treatise that first awakened the religious sensibilities of Dr Johnson, who speaks of it in high terms, and from which the brothers Wesley also derived much advantage. Next to the *Serious Call*, his most important works are his *Answer to Mandeville's Fable of the Bees* (published 1724; republished, with an introduction by the Rev. F. D. Maurice, 1844), his *Letters to the Bishop of Bangor, The Way to Knowledge, and The Spirit of Love*. His collected works were published (Lond. 9 vols. 1762).

LAW, JOHN, comptroller-general of the finances of France, and famous for his credit operations during the minority of Louis XV., was born at Edinburgh, 21st April 1671. His father was a goldsmith and banker, and proprietor of the estate of Lauriston, near Edinburgh. L. early shewed a most remarkable talent for arithmetic, algebra, and kindred sciences. After the death of his father, he removed to London, where he was admitted into the first circles of fashion, but was soon compelled to flee, in consequence of a duel in which he killed his adversary. He went to Amsterdam, and spent his time in studying the credit operations of the bank. About the year 1700, he returned to Edinburgh, a zealous advocate of a paper currency; but his proposals to the Scottish parliament on this subject met with an unfavourable reception. He now visited different parts of the continent, where he accumulated a large fortune by gambling, but sought in vain to win the favour of governments to his banking schemes. At last, he settled in Paris, and in company with his brother William, set up, in 1716, a private bank, which was soon successful and prosperous to such an extraordinary degree, that the Duke of Orleans, the Regent, adopted, in 1718, L.'s plan of a national bank, and issued prodigious quantities of bank-notes, which enjoyed perfect credit, whilst the ordinary national bonds remained, as they had long been, at a price far below their nominal value. In 1719, L. originated his *Mississippi Scheme* (q. v.), and the following year was made a Councillor of State and Comptroller-general of Finances; but on the failure of his scheme, and the insolvency of the national bank, he resigned the latter office, and thought it prudent to quit France. He proceeded first to Brussels, but finally settled in Venice, where he managed to eke out a wretched living by gambling, and died there in May 1723. A complete edition of his works was published at Paris in 1790, and another in 1843.

LAWBURROWS, LETTERS OF, in Scotch Law, a writ or document in the name of the sovereign, commanding a person to give security against offering violence against another. The person applying for or issuing the letters must swear to the truth of some cause of alarm, such as actual personal violence or threats of violence. Sometimes a wife may apply for lawburrows against a husband. The person against whom the letters are directed, must find caution to keep the peace within a certain number of days specified, and this he does by executing a bond of caution. If he, notwithstanding, use violence, an action of contravention of lawburrows may be raised against him before justices of the peace, and he is fined in a sum equal to the actual damage resulting, which is paid to the party injured. An action lies against a person who maliciously takes out letters of lawburrows against another. Lawburrows corresponds

to what are called Articles of the Peace (q. v.) in England or Ireland.

LAW-MERCHANT, a name often used in law to denote the customs which have grown up among merchants in reference to mercantile documents and business, such as bills of exchange, bills of lading, &c. These customs become incorporated with, and form part of, the common law, and are binding as such.

LAWRENCE, a city of Massachusetts, U.S., on both sides of the Merrimack River, 26 miles from its mouth, and the same distance north of Boston. It is a handsome manufacturing city, with a park, and fountains supplied from a reservoir 140 feet high; has 14 churches, 3 weekly newspapers, and cotton manufactories employing a capital of 6 millions of dollars. These are supplied with water-power by a granite dam across the Merrimack River, 1629 feet long, and at the deepest part 40½ feet high, which has created a basin 9 miles long. The water is distributed to the mills by a canal 1 mile long, 100 feet wide, and 12 deep. The city has been entirely built within a few years, and was incorporated in 1853. Pop. in 1860, 17,639.

LAWRENCE, GULF OF ST., a western inlet of the Northern Atlantic, washes at once all the British provinces, properly so called, of North America—Newfoundland, Canada, New Brunswick, Nova Scotia, and Prince Edward's Island. It has three communications with the ocean—the Strait of Bellefleur, between Newfoundland and Labrador; the Gut of Canso, between the island of Cape Breton and the peninsula of Nova Scotia; and a far wider passage than either, with the island of St Paul in the middle, between Cape Breton and Newfoundland: while in the opposite direction it narrows, at the west end of Anticosti, into the estuary of the mighty river, to which, as far even as its sources, it has gradually extended its own name. Besides Anticosti, St Paul's, and Prince Edward's, already mentioned, this arm of the sea contains very many clusters of islands, and, more particularly in its southern half, the Magdalens and the Birds; these islands being, one and all, rendered more dangerous to shipping by the thickness of the fogs and the uncertainty of the currents. The Gulf of St L. is celebrated for the productiveness of its fisheries; but perhaps it is best known as a channel of traffic, connecting, as it does, the busiest thoroughfares of maritime trade with one of the most extensive systems of inland navigation in the world.

LAWRENCE, ST., the river mentioned in the preceding article, constitutes by far the largest body of fresh water in the world. Including the lakes and streams, which it comprises in its widest acceptance, it covers, according to the lowest estimate, fully 73,000 square miles; and as nearly the whole of this area averages considerably more than 600 feet in depth, the aggregate cannot represent less than 9000 solid miles—a mass of water which would take upwards of 40 years to pour over the Falls of Niagara, at the computed rate of a million cubic feet in a second. As the entire basin of this water-system falls short of 300,000 square miles, the surface of the land is only three times that of the water.

This mighty artery of North-east America rises, under the name of the St Louis, on the spacious plateau which sends forth also the Mississippi towards the Gulf of Mexico, and the Red River of the north towards Hudson's Bay—all three being said, in wet seasons, occasionally to mingle their floods. Lake Superior, the next link in the chain, finds its way to Lake Huron through the rapid of St Mary, which has been overcome by a ship

canal on the right, or American side. Below Lake Huron, which receives Lake Michigan from the south, the river St Clair, Lake St Clair, the river Detroit and Lake Erie maintain pretty nearly the same level, till the river Niagara descends 334 feet to Lake Ontario, which is itself still 230 feet above sea-level. From this, the last of the connected series of inland seas, issues the St L. proper, which, with a few comparatively insignificant expansions, presents the character first of a river, and then of an estuary, down to the gulf. Between Lake Ontario and the city of Montreal, which marks the head of the navigation, there are various cataracts or rapids, which, besides having been gradually ascertained to be more or less practicable, may be all avoided by means of canals on the British side. At about two-thirds of the distance from Lake Ontario to the city of Montreal, the intersection of the parallel of 45° determines the point where the St L., after having been an international boundary from the head, or nearly so, of Lake Superior, becomes exclusively Canadian. Immediately above the island of Montreal, the St L. is joined by its principal auxiliary, the Ottawa, from the north-west; and a little more than half-way between this confluence and Three Rivers, the highest point of tidal influence, the Richelieu or Sorel, from the south, brings in the tribute of Lake Champlain. At Quebec, above which vessels of more than 600 tons can scarcely ascend, the river, after a run of nearly 400 miles from Lake Ontario, steadily widens into an estuary of about the same length. The entire length, including the chain of lakes, is about 2200 miles.

In connection with the improvements on itself and its affluents, the St L. offers to sea-going ships the noblest system of inland navigation in the world, embracing a continuous line of about 2000 miles; its advantages, however, are materially impaired by the severity of the climate, which binds it in the chains of winter at least five months in the year.

LAWRENCE, St, the Deacon, one of the most celebrated martyrs of the early church, the subject of many ancient panegyrics, and of one of the most elaborate of the hymns of Prudentius. He was one of the deacons of Rome, in the pontificate of Sixtus I. (3d c.), and as such was especially charged with the care of the poor, and the orphans and widows. In the persecution of Valerian, being summoned, according to the legend, before the prætor as a Christian, and being called on to deliver up the treasures of the church, he mockingly produced the poor and the sick of his charge, declaring that 'those were his treasures;' and on his persisting in his refusal to sacrifice, being condemned to be roasted on a gridiron, he continued throughout his tortures to mock his persecutors. Many of the details of his martyrdom are probably due to the imagination of the poetical narrator; but the martyrdom is unquestionably historical, and dates from the year 258. His feast is celebrated on the 10th August.

LAWRENCE, SIR THOMAS, President of the Royal Academy, was born at Bristol in 1769, and at the early age of ten years entered on the profession of a portrait-painter in crayons, at Oxford, where he immediately obtained full employment. There is an engraving which bears to have been 'directed by L. K. Sherwin,' the celebrated engraver, of a portrait of the young artist; it is dedicated in the following terms: 'To the nobility and gentry in general, and the university of Oxford in particular, who have so liberally countenanced his pencil, this portrait of Master Lawrence is inscribed by their most devoted and most grateful servant, T.

Lawrence, senior.' It was published by Lawrence, senior, at Bath, June 18, 1783, along with a print of Mrs Siddons in the character of Zara, drawn by Master L., and engraved by J. R. Smith. The young artist next set up at Bath, where he met with great encouragement; and at the age of eighteen, settled in London, and entered as a student of the Royal Academy, having a year previously taken to painting in oil. His success was extraordinary; in 1791, before he attained the age required by the laws of the Academy, he was elected a supplemental associate by desire of the king; on Reynolds's death a year afterwards, was appointed limner to his majesty; was made a Royal Academician in 1798; knighted in 1815; and on Benjamin West's death in 1826, succeeded him as President of the Royal Academy. He died in London, 7th January 1830. L. was the favourite portrait-painter of his time, had an immense practice, and obtained larger prices for his works than were ever paid to any previous portrait-painter. His talent as a painter was doubtless overrated during his life, but justice has scarcely been done to it of late years; for his style, though in many respects meretricious, was greatly influenced by the fashion and dress of the period, and in time to come, impressions of the principal characters who figured during the Regency, and in the reign of George IV., will be taken mainly from his works. His portraits in the Waterloo Gallery at Windsor are of the greatest value as historical monuments. He was a man of great urbanity and fine taste, and left at his death a most valuable collection of drawings by the old masters, now unfortunately broken up. See the *Life and Correspondence of Sir T. Lawrence*, by Williams (1831), and Cunningham's *Lives of British Painters* (1833).

LAWRENCE, RIGHT HONOURABLE SIR JOHN LAIRD-MAIR, Bart, Indian statesman, is younger son of Lieutenant-colonel Alexander Lawrence, who served in the Mysore campaign, and at the capture of Seringapatam. Born at Richmond, Yorkshire, 1811, he obtained, in 1827, a presentation to Haileybury College, where he carried off the chief prizes for law, oriental languages, &c. His first years in the Indian civil service were spent in Delhi and the neighbourhood. On the annexation of the Punjab, consequent upon the treacherous rebellion of the Sikhs, L. was appointed commissioner, and afterwards lieutenant-governor of the Punjab. His administration was marked by rare talents, and rewarded by brilliant success. When the Indian mutiny broke out, his great qualities and force of character proved the main stay of the British dominion in India. The once restless Sikhs had become so attached to his firm, equitable, and beneficent rule, that L. was enabled to send troops to the relief of Delhi, &c. So timely was this succour, and so great was his foresight, that he was styled, with a perhaps pardonable exaggeration, 'the saviour of India.' On his return to England, he received the order of G.C.B., the thanks of parliament, with the grant of a pension of £1000 a year, the freedom of London, Glasgow, &c. He was made a baronet and appointed a member of the council of India in 1858, and a privy-councillor in 1859. In 1861, when the order of the 'Star of India' was instituted by the Queen, L. was nominated one of the knights.

His elder brother, Brigadier-general **SIR HENRY MONTGOMERY LAWRENCE**, born in 1806, was chief commissioner of Lucknow, and virtually governor of Oude when the Indian mutiny broke out. While in command of the handful of heroic men who defended the women and children in the Residency of Lucknow, Sir Henry was wounded by the explosion of a shell, and died July 4, 1857. He was the

founder of the Lawrence Asylum, for the reception of the children of the European soldiers in India. A monument to his memory has been placed in St Paul's Cathedral.

LAW-TERMS. The usual law-terms in England and Ireland mean those periods of the year during which the law-courts sit in banc or in full court to dispose of business. These are of ancient origin, and are now fixed by statute as follows: Hilary term begins January 11, ends 31st January; Easter term begins April 15, ends 8th May; Trinity term begins May 22, ends 12th June; Michaelmas term begins November 2, ends 25th November. Though the courts always sit at those periods, yet they have a power of appointing sittings after term also, which power is always exercised for the despatch of arrears of business. And the judges also practically sit nearly all the year round, disposing of business of one kind or another, except in the long vacation, which extends from 10th August to 24th October. But even during that period also, one or more judges attend to perform incidental business; and it is only for some purposes, and for some kinds of business, that the long vacation acts as a suspension of hostilities.

In Scotland, the law-terms are differently arranged. The Court of Session sits from 12th November to 20th March, and from 12th May to 20th July. But there also the judges are employed in other business during the intervals.

As to the quarter-days usual between landlord and tenant, see **LANDLORD AND TENANT**.

LAWYER, in the United Kingdom, is not a technical term of law, but a popular name given to those who are either practitioners of the law or intimately connected with its administration. In Great Britain and Ireland, lawyers are subdivided into two classes. See **ATTORNEYS AND SOLICITORS**, **BARRISTERS**, **ADVOCATES**. In the United States of America, an attorney acts as counsel, and *vice versa*, there being no similar subdivision of the profession, and the expediency of the subdivision has often been canvassed in the United Kingdom of late years.

LAYARD, AUSTEN HENRY, English traveller and politician, was born at Paris in 1817. He was destined for the law, but finding the profession little congenial to his tastes, he set out on a course of eastern travel, visited several districts of Asiatic Turkey, and became familiar with the manners and dialects of Persia and Arabia. On his first journey along the banks of the Tigris, in 1840, he was struck with the ruins at Nimrud—a village near the junction of the Tigris and the Zab, pointed out by local tradition as the site of the original city of Nineveh—and felt an irresistible desire to examine the remains of the 'birthplace of the wisdom of the west.' In 1842, M. Botta, the French consul at Mosul, conducted some extensive excavations at that place, and L. returning to the region, again directed his attention to Nimrud. It was 1845 before he could obtain the requisite means and facilities for his search, and he then, with the help of some Arabs, began secretly to dig in the mound supposed to contain the ruins. He soon came upon some sculptured remains, and became convinced that he had touched a rich vein of archaeological treasure. His excavations were resumed in 1846 and 1847, and his energy and perseverance were rewarded by the discovery of the ground remains of four distinct palatial edifices. The walls had been lined with large slabs of gypsum or alabaster, covered with bas-reliefs and cuneiform inscriptions. Many of these were sent to England by L., together with gigantic-winged human-headed

bulls and lions, and eagle-headed deities. They were placed in the British Museum, of which they have since remained the chief attraction. L. at first conducted his search at his own expense; he was, in 1845, liberally assisted by Lord Stratford de Redcliffe, then British ambassador in Constantinople; and eventually, as the value of these specimens of Assyrian art began to be known, the House of Commons voted a sum of £3000, which was applied by the trustees of the British Museum, in continuing the excavations under L.'s superintendence. On his return to England, he published a narrative of his explorations, under the title of *Nineveh and its Remains*, and another work entitled *Monuments of Nineveh*. He was presented with the freedom of the city of London, received the honour of D.C.L. from the university of Oxford, and was Lord Rector of Aberdeen university in 1855–1856. Having determined to devote himself to a political career, he became, in 1852, M.P. for Aylesbury, but lost his seat in 1857. He visited the Crimea during the Russian war, and went to India after the mutiny. In 1860, he again entered the House of Commons as member for Southwark. In 1861, he was appointed Under-Secretary of State for Foreign Affairs in the Palmerston government. This post he continues (1863) to fill.

LAYING, or LAYERING, a mode of propagating trees, shrubs, and perennial herbaceous plants, which is very frequently employed by gardeners and nurserymen. It consists in bending and fastening a branch, so that a portion of it is imbedded in earth, there to throw out roots, the extremity being made to grow erect in order to form a new plant. The separation from the parent plant is not effected till the layer is sufficiently provided with roots. Any injury which prevents the free return of the sap greatly promotes the formation of roots, and a notch is therefore usually made in one side of the branch, at the place where the formation of roots is desired; it is also often a little split up from the notch; and sometimes a ring of bark is cut off, or a wire is twisted round it. The time which must elapse before the layer should be separated from the parent plant is very various; a few months being sufficient for some, and two years requisite for others. Many plants which can be propagated by cuttings are more easily and successfully propagated by layers.

LA'ZULITE, or AZURITE, a mineral long confounded with Lapis Lazuli (q. v.), but although somewhat similar in colour, very different in composition; consisting chiefly of phosphoric acid and alumina, with magnesia and protoxide of iron. It occurs imbedded in quartz, or in fissures in clay-slate, in Styria, North Carolina, Brazil, &c.

LAZZARO'NI, a name said to be derived from that of Lazarus in the parable, and, until lately, designating a particular class of the inhabitants of Naples. They had no fixed habitations, regular occupation, or secure means of subsistence, but occasionally obtained employment as messengers, porters, boatmen, itinerant vendors of food, &c. They have performed an important part in all the revolutions and movements in Naples for a long period, and in recent times have allied themselves to the cause of despotism. They were wont annually to elect a chief (*Capo Lazzaro*), who was formally recognised by the Neapolitan government, and who exercised an extraordinary power over them. Of late, they have lost many of their peculiarities, have come more within the pale of civilisation, and, in fact, are no longer recognised as a separate class, though the name is still given to the boatmen and fishermen of the city, who are really

the most industrious and best-principled of the Neapolitan populace.

LE, the capital of Ladakh, or Middle Tibet, on the right bank of the Upper Indus, in lat. $34^{\circ} 10' N.$, and long. $77^{\circ} 40' E.$, at an elevation of more than 10,000 feet above the sea. The population is about 4000. The place is a main *entrepôt* between Chinese Tartary and the Punjab, being more especially the grand mart for the famous shawl-wool of Tibet.

LEAD, *THE*, used on shipboard, for ascertaining the depth of water, consists of a piece of lead shaped like an elongated clock-weight, attached to a line of about 20 fathoms. The lower part of the lead is scooped out, and filled with tallow, that portions of the bottom may adhere. The *deep-sea lead* weighs from 25 to 30 lbs., and is attached to a line of far greater length.

LEAD (symb. Pb., equiv. 103·7, spec. grav. 11·4) is a bluish-white metal of considerable brilliancy, which soon disappears on exposure to the air, owing to the formation of a thin film of oxide. It is so soft that it may be readily cut with a knife, or may be made to take impressions, and it leaves a streak upon paper. It may be cut or beaten into thin sheets, but in ductility and tenacity it is low in the scale of metals. It is readily fusible at a temperature of about 625° , and at a higher temperature it absorbs oxygen rapidly from the air, and the oxide thus formed volatilises in the form of white fumes.

The combined action of air and water on lead is a subject of great practical importance, in consequence of the metal being so frequently employed in the construction of cisterns and water-pipes. The lead becomes oxidised at the surface, and the water dissolves the oxide; this solution absorbs the carbonic acid of the atmosphere, a film of hydrated oxycarbonate of lead ($PbO \cdot HO + PbO \cdot CO_2$) is deposited in silky scales, and a fresh portion of oxide of lead is formed and dissolved, and in this way a rapid corrosion of the metal ensues. This action is materially increased by the presence of some salts, and diminished by the presence of other salts in the water. It is much increased by the occurrence of chlorides (which, as chloride of sodium, is often present in spring water), and of nitrates and nitrites (which are often present in spring and river waters, from the decomposition of organic matter); while it is diminished by the sulphates, phosphates, and carbonates, and especially by carbonate of lime, which is an extremely common impurity in spring water. In the latter case, a film of insoluble carbonate of lead is rapidly formed on the surface, and the metal beneath is thus protected from the action of the water. If, however, the water contain much carbonic acid, the carbonate of lead may be dissolved, and considering the dangers that arise from the use of water impregnated with lead, cisterns constructed of slate are far preferable to leaden ones.

Pure lead is of very rare occurrence. Almost all the lead of commerce is obtained from Galena, the native sulphide of lead by a process to be presently explained. The lead thus obtained is often nearly pure, and to obtain it *perfectly* pure, it should be reduced with black flux from the oxide left by igniting the pure nitrate or carbonate.

The compounds of lead with oxygen are four in number—viz., a sub-oxide, Pb_2O , which is a black powder of no importance; a protoxide, PbO , which is the base of the ordinary salts of the metal; a binoxide, PbO_2 ; and red lead, which is a compound of the two last-named oxides, and is usually represented by the formula $2PbO \cdot PbO_2$. The protoxide is commonly known as *Litharge*. It is

obtained on a large scale by the oxidation of lead in a current of air, when it forms a scaly mass of a yellow or reddish tint. If the oxidation be effected at a temperature below that required for the fusion of oxide, a yellow powder, termed *Massicot*, is obtained. Litharge is much used by the assayer (see ASSAY) as a flux; it enters largely into the composition of the glaze of common earthenware, and it is employed in pharmacy in the preparation of plasters. A mixture of 1 part of massicot with 10 of brickdust, made into a paste with linseed-oil, forms the compound known as *Dhil mastic*, which, from the hardness with which it sets, is frequently employed to repair defects in stone-facings.

The most important of the salts of the protoxide of lead are—1. The carbonate ($PbO \cdot CO_2$), which occurs native as a beautiful mineral in transparent needles or fibrous masses, and which is prepared under the name of *white lead* on a large scale as a pigment by a process to be subsequently described. The carbonate is insoluble in water, unless it is largely charged with carbonic acid. It is quickly blackened by exposure to hydrosulphuric acid (sulphuretted hydrogen), either in the form of gas or in solution, and this is a serious drawback to the use of the lead salts as pigments. 2. The sulphate ($PbO \cdot SO_3$), which occurs native in white prismatic crystals, and is formed as a heavy white precipitate on adding sulphuric acid or a soluble sulphate to a soluble lead salt. 3. The nitrate ($PbO \cdot NO_3$), which is formed by dissolving lead or its protoxide in dilute nitric acid. 4. The *chromates*, of which the principal are the neutral chromate or *chrome yellow* ($PbO \cdot CrO_3$), and the dichromate or *orange chrome*. These are much used as pigments, and in calico-dyeing. 5. The *acetates*. The ordinary or neutral acetate ($PbO \cdot C_2H_3O_2 + 3aq.$) is prepared on a large scale by the solution of litharge in distilled vinegar, and evaporation, when the salt is obtained in four-sided prisms, or more commonly in a mass of confused minute white crystals, which at 212° lose their water of crystallisation. From its appearance, and from its sweetish taste, it derives its common name of *sugar of lead*. It is much used both in medicine and in the arts. Basic acetate of lead, regarded by some chemists as a diacetate, and by others as a triacetate, and commonly known as *Goulard's Extract*, is prepared by boiling a solution of sugar of lead with litharge, and adding alcohol, when the salt separates in minute transparent needles. It is the active ingredient of *Goulard Water*, which is imitated by the *Liquor Plumbi Diacetatis Dilutus*, and of *Goulard's Cerate*, which is imitated by the *Ceratum Plumbi Compositum* of the London Pharmacopœia.

The best tests for solutions of the salts of lead are the formation of a black sulphide with hydrosulphuric acid or hydrosulphate of ammonia, insoluble in an excess of the reagent; of a white insoluble sulphate with sulphuric acid, or a soluble sulphate; of a yellow chromate with chromate of potash; and a yellow iodide with iodide of potassium. All the salts of lead, insoluble in water, are soluble in a solution of potash. Before the blow-pipe on charcoal, the salts of lead yield a soft white bead of the metal, surrounded by a yellow ring of oxide.

Its use in Medicine.—The most important compound of lead in the materia medica is the *acetate of lead*, which is administered internally as an astringent and as a sedative. It is of service as an astringent, especially in combination with opium, in cases of mild English cholera, and even of Asiatic cholera, and in various forms of diarrhoea. It will frequently check the purulent expectoration in

LEAD.

phthisis, and the profuse secretion in bronchitis. In the various forms of hæmorrhage—as from the lungs, stomach, bowels, or womb—it is employed partly with the view of diminishing the diameter of the bleeding vessels, and partly with the object of lowering the heart's action, and by these means to stop the bleeding. The ordinary dose is two or three grains, with half a grain of opium, in the form of a pill, repeated twice or thrice daily. If given for too long a time, symptoms of Lead-poisoning (q. v.) will arise.

Mining, Smelting, &c.—Lead was largely worked by the Romans in Great Britain, and pigs with Latin inscriptions have been frequently found near old smelting-works. The mining of lead in England was formerly regulated by curious laws; some places, such as the King's Field, in Derbyshire, having special privileges. It was the custom in this district not to allow the ore to leave the mine till it was measured in the presence of an official called a *bar-master*, who set aside a 25th part as the king's cope or lot. Up to a comparatively recent period, persons were allowed to search for veins of the ore without being liable for any damage done to the soil or crops.

Lead ore is pretty generally distributed, but by far the largest supply of this metal is obtained from Great Britain and Spain, the former country yielding some 65,000 tons per annum, and the latter probably an equal supply. Nearly a fourth of the total British produce is procured from the Northumberland and Durham district, where there exists, at Allenheads, one of the largest mining establishments in the world. Scotland and Ireland furnish only a very small quantity.

With the exception of a little from the carbonate of lead, all the supplies of this metal are obtained from the sulphuret of lead or Galena (q. v.). The lead ore, when taken from the mine, is broken up into small pieces, 'hotched,' and washed, to separate impurities, by means of apparatus described under METALLURGY. Sulphuret of lead, when tolerably pure, is smelted with comparative ease. It is first roasted in a reverberatory furnace, such as is shown in the figures 1 and 2. From

lead, combine to form sulphureous acid gas (SO_2), which passes off as waste, and metallic lead remains in the bottom of the furnace, and is run off at the tap-hole, g.

In some districts, the roasted ore is smelted on a separate ore-hearth called the Scotch furnace. It somewhat resembles a smith's forge, and like it, has the heat urged by bellows. Peat and coal are used as the fuel. This is a slower mode of smelting than by the reverberatory furnace, but yields a purer lead.

During the operation of smelting, a considerable quantity of lead is volatilised, and carried off as fumes or smoke, which, when allowed to escape into

Fig. 2.—Plan of a Reverberatory Lead Furnace:

a, hearth on which the ore is spread; b, fireplace or grate; c, the fire bridge; d, chimney; e, working doors; f, opening for supplying ore; g, tap-hole.

the atmosphere, is not only so much lead lost, but destroys all vegetation for some distance around the works, and poisons cattle and other animals feeding near them. Of late years, a mode of obviating these evils has been partially introduced—it consists in leading the smoke from the several furnaces into one large flue, which is conducted to an exhausting chamber. The smoke passes in a zig-zag manner through the vacuum chamber, in the interior of which a stream of water, sufficient to condense the lead and other matters suspended in the vapours, is kept flowing. About 33 per cent. of the fume thus recovered consists of metallic lead.

When lead contains antimony and tin as impurities, they are separated by fusing the metal in shallow pans, and allowing it to oxidise at the surface. In this way, the antimony and tin form oxides, and as such are skimmed off. Lead reduced from galena always contains a little silver, of which 8 or

Fig. 1.—Section of a Reverberatory Lead Furnace.

20 to 40 cwts. of galena are put into the furnace at a time, either with or without lime. In about two hours, the charge becomes sufficiently roasted. During the process, the larger portion of the ore (PbS) takes up four equivalents of oxygen, and becomes sulphate of lead (PbO, SO_3), a little oxide of lead (PbO) is also formed, while another portion remains unaltered as sulphuret of lead. After it is roasted, the ore is thoroughly mixed together, and the heat of the furnace suddenly raised. The result is, that the sulphur and oxygen of the sulphate, and the sulphur of the sulphuret of

Fig. 3.—Desilverising Pot:

10 ounces to the ton is a very common proportion, although it often exists in much larger quantity. The separation of this silver is now greatly facilitated by means of a desilverising process patented by the

late Mr H. Pattinson of Newcastle-on-Tyne. It consists in melting the lead, and allowing it to cool slowly, at the same time briskly stirring the melted mass. A portion of the lead is thus made to crystallise in small grains, which, as pure lead solidifies at a lower temperature than when alloyed with silver, leaves the uncrystallised portion richer in silver. In this operation, a row of, say, nine cast-iron pots are used similar to the one shown in fig. 3. They are usually about 6 feet in diameter, and each heated with a fire below. The lead from the smelting furnace is treated as above in the middle pot, from which the poorer crystallised portion is ladled with a strainer into the first pot on the right, and the richer portion, which remains liquid, is removed to the first pot on the left. With both kinds, the process is several times repeated—the one becoming poorer, and the other richer in silver every time, till the lead in the pot on the extreme right has had its silver almost entirely removed, and that in the pot on the extreme left contains about 300 ounces of silver to the ton. The silver is then obtained from this rich lead by melting it on a flat bone ash cupel, placed in a reverberatory furnace, and exposing it to a current of air which reduces the lead to the oxide or *litharge* of commerce, leaving the silver on the cupel. Nearly 600,000 ounces of silver are in this way annually separated from British lead, the latter at the same time being improved in quality.

Lead is an important metal in the arts. Rolled out into sheets, it is largely used for roofing houses, for water-cisterns, and for water-pipes. It is also of great service in the construction of large chambers for the manufacture of sulphuric acid. Its value for the manufacture of shot is well known. Alloyed with antimony, &c., it is largely consumed for type-metal, and with tin for solder. Much lead is also required for the manufacture of pewter, Britannia metal, &c. See ALLOY.

Of the compounds of lead other than alloys which occur largely in commerce, the following are the principal:

White Lead or Carbonate of Lead, a substance very extensively used as white paint, and also to form a body for other colours in painting. As much as 16,000 tons of it are annually made in England. White lead is still largely made by the old Dutch process, which consists in treating metallic lead, cast in the form of stars or gratings, in such a way as to facilitate the absorption of carbonic acid. These stars of lead, placed in earthenware vessels, like flower-pots, containing a little weak acetic acid, are built up in tiers in the form of a stack, and surrounded with spent tan or horse-dung. The heat given out from the dung volatilises the acid, which, along with the air, oxidises the lead. The acetic acid changes the oxide into the acetate of lead, and this is, in turn, converted into the carbonate by the carbonic acid given off from the hotbed. By this process, metallic lead requires from six to eight weeks for its conversion into white lead. Some new and more rapid modes have been introduced for the preparation of this material from litharge, and also from acetate of lead, by exposing them to a current of carbonic acid gas, but the white lead so manufactured is inferior in opacity.

Minium, Red Lead, or Red Oxide of Lead, is much consumed in the manufacture of flint-glass and porcelain, and to some extent as a pigment. It requires to be made of very pure lead, as a slight trace of copper would impart a colour to glass. Minium is prepared by heating *massicot* or protoxide of lead to a temperature of 600° F. in iron trays, in a reverberatory furnace, carefully avoiding fusion. More oxygen is thus gradually absorbed; and a compound of the protoxide and the peroxide of lead is formed,

having a bright red colour, which is the red lead of commerce.—*Litharge* has been already noticed.

LEAD-POISONING. Persons whose system becomes impregnated with lead, as, for example, painters, who are constantly handling white lead, or persons who for a length of time have been using water charged with a lead-salt, exhibit a series of phenomena of lead or saturnine poisoning.

The early phenomena, which constitute what Tanquerel des Planches, the highest authority on this subject, terms *primitive saturnine intoxication*, are, (1), a narrow blue line, due to the presence of sulphide of lead, on the margin of the gums next the teeth; (2), a peculiar taste in the mouth, and a peculiar odour of the breath; (3), a jaundiced state of the skin, with more or less emaciation; (4), a depressed state of the circulation.

These premonitory phenomena are followed, unless remedial means are adopted, by the four following forms of disease, each of which may exist alone, or may be complicated with one or more of the others, or may follow the others, without, however, having any definite order of succession.

1. **LEAD COLIC**, which is by far the most frequent of the diseases.

2. **LEAD RHEUMATISM or ARTHRALGIA**, which in frequency is next to colic.

3. **LEAD PALSY or PARALYSIS**, which may affect either motion or sensation, and is next in frequency.

4. **DISEASE OF THE BRAIN**, which is the least common of all the forms of lead-poisoning, and is manifested by delirium, by coma, or by convulsions.

Lead Colic is characterised by sharp continuous abdominal pains, which are usually diminished on pressure; by hardness and depression of the abdominal walls; by obstinate constipation, slowness and hardness of the pulse, and general disturbance of the system. The blue line on the gums serves at once to distinguish it from other varieties of colic.

Lead Rheumatism is characterised by sharp pains in the limbs, unaccompanied by redness or swelling, diminished by pressure, increased by motion, and accompanied by cramps, with hardness and tension of the affected parts. It is distinguished from similar affections by the blue line on the gums.

Lead Palsy is characterised by a loss of voluntary power over certain muscles. It more commonly affects the upper than the lower extremity, and the muscles most frequently affected are those of the ball of the thumb, and the extensors of the wrist, giving rise to the condition represented in the figure as *wrist-drop*.

A shows the dropping of the hand in consequence of the palsy of the extensor muscles, while B shows the wasted condition of the muscles which form the ball of the thumb.

The Treatment.—The patient should be placed in a sulphuretted bath, which converts all the lead-salts on the skin into the inert black sulphide of lead. These baths should be repeated till they cease to cause any coloration of the skin. At the same time, he should drink water acidulated with sulphuric acid, or a solution of sulphate of magnesia, with a slight excess of sulphuric acid, by which

mass as insoluble sulphate of lead is formed, which is eliminated by the purgative action of the excess of sulphate of magnesia. Iodide of potassium is then administered, which acts by dissolving the lead out of the tissues, and allowing it to be removed by the urine.

The palsy may be specially treated, after the elimination of the lead, by electricity, and by strychnine in minute doses.

Persons exposed from their occupation to the risk of lead-poisoning should be especially attentive to cleanliness; and if they combine the frequent application of the warm bath with the use of sulphuric lemonade or treacle beer acidulated with sulphuric acid, as a drink, they may escape the effects of the metallic poison.

LEADER, the name given to the performer in an orchestra who plays the principal first-violin.

LEADING NOTE (*Fr. note sensible*), in Music, is usually understood to mean the sharp seventh of the diatonic scale, or the semitone below the octave, to which it leads. The most of the German theorists have now relinquished the term leading note, as every note, when it is felt that another immediately above or below it should follow, may be said to be a leading note.

LEADING QUESTION is a technical expression in Law to denote a question so put to a witness as to suggest the answer that is desired or expected. Thus, if a witness is asked: 'Was he dressed in a black coat?' it is supposed the witness will answer, yes; whereas the proper way of putting the question is: 'How was he dressed?' or, 'What kind of coat?' &c. The rule established in courts of justice as to the correct practice in such matters, is, that when a witness is examined in chief, i. e., by the party who adduces such witness, leading questions are not allowed, except in one or two rare cases; whereas, when the witness is cross-examined, i. e., by the opposing party, leading questions may be put; for the object is to make the witness contradict and stultify himself, so that the jury will disbelieve him. The above rule, however, only applies to material questions, for in immaterial questions leading questions may be put, so as to save time.

LEAF-CUTTER BEE, a name given to certain species of solitary bees (see *BEE*) of the genera *Megachile* and *Osmia*, in consequence of their habit of lining their nests with portions of leaves, or of the petals of flowers, which they cut out for this purpose with the mandibles. *Megachile centuncularis*, a common British species, uses the leaves—not the petals—of roses, fitting the pieces together so as to form one thumb-shaped cell within another, in a long cylindrical burrow, the bottom of each cell containing an egg and a little pollen paste. The structure of these nests is very nice and curious.

LEAF-INSECT, or **WALKING-LEAF** (*Phys-*

tropical countries, having wings extremely like leaves, not only in colour, but in the way in which they are ribbed and veined. The joints of the legs are also expanded in a leaf-like manner. These insects spend their lives among leaves, move slowly, and would be much exposed to every enemy, did not their leaf-like appearance preserve them from observation.

LEAGUE (from the Lat. *leuca*), a measure of length of great antiquity. It was used by the Romans, who derived it from the Gauls, and estimated it as equivalent to 1500 Roman paces, or 1376 modern English miles. The league was introduced into England by the Normans, probably before the battle of Hastings (1066), and had been by this time lengthened to 2 English miles of that time, or 2½ modern English miles. At the present day, the league is a nautical measure, and signifies the 20th part of a degree—i. e., 3 geographical miles, or 3.456 statute miles. The French and other nations use the same nautical league, but the former nation had (until the introduction of the metrical system) two land-measures of the same name, the legal posting-league = 2.42 Eng. miles, and the league of 25 to the degree, which is = 2.76 statute English miles.

LEAGUE, the term generally employed in the 16th and 17th centuries to designate a political alliance or coalition. The most famous leagues were those of Cambray, Schmalkald, Nuremberg, &c. But the name has a peculiar importance in the history of France, as applied to the opposition organised by the Duke of Guise (q. v.) to the granting of the free exercise of their religion and political rights to the Huguenots. This league, known as the Holy League (*Sainte Ligue*), was formed at Paris, in 1576, for the maintenance of the Roman Catholic religion in its predominance; but the object of the Guises was rather to exclude the Protestant princes of the blood from the succession to the throne. For an account of the civil war that ensued, see HENRY III., HENRY IV., and GUISE.—See Mignet, *Histoire de la Ligue* (5 vols. Par. 1829).

LEAKE, WILLIAM MARTIN, a lieutenant-colonel in the British army, and a traveller who has contributed much to our knowledge of the ancient and modern geography, history, and antiquities of Greece. He was born in 1777, and died January 8, 1860. With remarkable critical acuteness and soundness of judgment, he combined great learning and an admirable power of clear statement. His principal works, containing the matured fruit of his observations and studies, are—*Researches in Greece*, &c. (1814); *The Topography of Athens*, &c. (1821); *Journal of a Tour in Asia Minor, with Comparative Remarks on the Ancient and Modern Geography of that Country* (1824); *Travels in the Morea* (1830); *Travels in Northern Greece* (1835); and *Numismatic Hellenica* (1854).

LEAMINGTON, a fashionable watering-place in the county of Warwick, England, and one of the handsomest towns in the country, is beautifully situated on the Leam, a tributary of the Avon, about two miles from Warwick. It contains public gardens, a proprietary college, erected in 1847 in the Tudor style, and other institutions. In the centre of the town is a Pump Room, a handsome structure. L. is wholly of modern growth, having become important only within the present century. Its mineral waters are saline, sulphureous, and chalybeate. The watering-season lasts from October till May. The town stands in the centre of a fine hunting-country, and is much resorted to by lovers of the chase. Pop. (1861) 17,966.

Leaf-Insect.

(*Sim.*), a very remarkable genus of orthopteran insects, of the family *Phaneroptera* (q. v.), natives of

LEAP-YEAR, a year of 366 days (see **CALENDAR**), so called because it leaps forward a day as compared with an ordinary year. It so happens that the leap-years coincide with the years that are divisible by four, and thus they may be known. Of the years concluding centuries, only every fourth is a leap-year, beginning with 2000, which is divisible by 400, as is also 2400, &c. The term *Bissextile*, applied by the Romans to leap-year, arose from their reckoning the 6th before the Kalends of March (24th February) twice (*bis*), whereas we add a day to the end of the month, making the 29th of February.

LEASE is the contract establishing the relation between Landlord and Tenant (q. v.). If the term of years is more than three, then it must be by deed under seal in England, or by writing in Scotland, if for more than one year. An improving lease is where the lessee agrees to keep the premises in repair. A building lease is where the tenant intends to build a house on the land. See **BUILDING LEASE**, also **GROUND-RENT**.

The granting of leases to those holding land from the owners, has been general in Scotland for more than a century. To this is, no doubt, to be ascribed, to a great extent, the rapid progress which improvements in farming have made in the north within that period. The length of leases in Scotland is commonly nineteen years. Recently, in pastoral farms, where no rotation of crops is required, and no substantial improvement expected, short leases of seven or ten years have come into use. What we have to notice in particular, is the common agricultural lease of nineteen years, which forms the great base of rural prosperity. During the currency of this species of lease, the tenant has in a great measure the uncontrolled possession of the land, and this lengthened term enables him to reap the benefits of improvements or money expended. Leases on the Scotch system are now becoming more general both in England and Ireland. No doubt, holding land from year to year has wrought well in some parts of England, where large capitals are invested in the land by tenants who have no other security than the good faith and feeling between themselves and landlords. In Scotland, however, the system of leases alone meets the tastes and genius of farming. A lease should be clearly and concisely written, so that the terms may be well understood by both parties, and all disputes at its expiry avoided. The cropping clauses of leases vary with the localities. In the neighbourhood of towns, the tenant is usually allowed to sell the whole produce, including the straw, but is bound to bring back manure to make up the waste. In inland parts, on the other hand, where the selling of the straw year after year might impoverish the soil, it is customary to restrict tenants from so doing. It is also common to debar tenants from selling turnips. Both these clauses cannot be considered as any hardship to improving tenants. The raising and selling of potatoes off the land should not be restricted. In the best arable districts, tenants are often bound not to take two white crops in succession. This is, perhaps, a good enough rule to be applied to light lands, but in other cases barley might be allowed to be taken after wheat. All farmers should be allowed to grow pease to a certain extent, but not more than the twentieth part of the land under regular cultivation. The cropping clauses should be framed in accordance with the systems prevailing in the neighbourhood. Whatever these are, they should be clearly defined. No such clauses as 'farming according to the rules of good husbandry' should be allowed, as this is apt to lead to a disagreement in defining what these rules are.

The terms of entry are usually Whitsunday and Martinmas, which require very different arrangements in the terms of leases. In drawing up these, the most experienced farmers of their respective districts should be consulted, and the terms framed, as far as possible, to encourage the free application of capital to land, and at the same time to avoid the deterioration of the land at the expiry of the term.

The following are the usual clauses in an agricultural lease: viz.—1. Landlord lets lands specified for term of years, excluding assignees and sub-tenants. 2. Reserves mines, &c., with power to work them; power to excavate, plant, alter and make roads, hunt, shoot and fish, cut and carry away trees, feu part of lands for building purposes, inspect farm, &c. When exercise of reservations causes surface damage, this to be paid for. 3. Clause of warrandice. 4. Assignment to obligation of previous tenant to leave premises in order. 5. Specific details as to additional houses and fences required. 6. Obligation on tenant to pay rent specified at two terms. 7. To maintain and leave fences in good repair. 8. To insure houses against damage by fire. 9. Cropping clause regulating cultivation of lands, and manner in which they are to be left; and also disposal of waygoing crop, manure, fallow-break, &c. 10. Arbitration clause for settlement of disputes. 11. Obligation to remove at expiration of lease. 12. General obligatory clause. 13. Clause of registration. And 14. Testing clause.

Every lease has its own peculiar details in reference to drainage, houses, and cropping. When a tenant enters without paying for the straw or manure, it is called 'steelbow', and he receives no value for these when he leaves. Occasionally, rents are paid wholly or in part by the current price of grain, a quantity of grain being fixed, convertible at the average market price of the season, as determined by a jury before the sheriff in a court called the *Fairs Court*. In consequence of the preciseness in which Scotch leases are drawn up, disputes are of rare occurrence. It will, of course, be understood that such leases can only be brought into operation where landlords are able and willing to put farms thoroughly in order for the tenant, and where the tenant possesses sufficient capital to work the farm advantageously.

LEASE AND RELEASE, a name given to a conveyance of land formerly much used in England, but now superseded by a Grant.

LEASEHOLD. A leasehold estate is merely the interest or property which a man has who holds a lease; and he is also sometimes called a leaseholder. A leasehold estate is of much less value than a freehold estate, for a lease must some time or other come to an end, whereas a freehold estate is held by a man and his heirs for ever—that is, until he or they choose to part with it. See **LANDLORD AND TENANT**.

LEASH, in Falconry, the thong of leather by which a hawk is held. The word also signifies a line affixed to the collar of a greyhound, and is used in both significations in Heraldry.

LEASING-MAKING, in Scotch Law, means seditious words, which constituted an offence punishable with death by ancient statutes of 1584 and 1585. The punishment was afterwards mitigated to fine and imprisonment, or both, at the discretion of the court.

LEATHER consists essentially of the skins of animals chemically altered by the vegetable principle called Tannin, or Tannic Acid (q. v.), so as to arrest that proneness to decompose which is characteristic of soft animal substances. Its invention reaches beyond the dawn of history, and was

LEATHER.

probably among the earliest germs of civilisation; for as the skins of animals would naturally be among the first articles of clothing, any means of preserving them more effectually than by drying would be highly prized. The discovery that bark had this effect was doubtless the result of accident. The principle of its action was unknown up to the present century; and the same unvarying method had been employed from the earliest times until the last few years, when the invention of new processes has much facilitated the manufacture.

The skins of all animals used in the production of leather consist chiefly of gelatine, a substance which easily enters into chemical combination with the tannic acid found in the bark of most kinds of trees, and forms what may be termed an insoluble *tanno-gelatin*. This is the whole theory of tanning, or converting the skins of animals into leather. Formerly, oak-bark was supposed to be the only tanning material of any value; but lately, very numerous additions have been made to this branch of economic botany.

In addition to the process of tanning in making leather, there are other modes, one of which is *truing*, another *dressing in oil*. The following are the skins which form the staple of our leather manufacture: ox, cow, calf and kip, buffalo, horse, sheep, lamb, goat, kid, deer, dog, seal, and hog.

The term *pelt* is applied to all skins before they are converted into leather. When simply made into leather in the state we find in shoe-soles, it is called 'rough leather;' but if, in addition, it is submitted to the process called currying, which will be hereafter described, it is termed 'dressed leather.'

Fig. 1.

The following trade-terms are in general use: hides or crop-hides, butts and backs, bends, offal, and skins. The complete hide is seen in fig. 1. The same rounded, with the cheeks, shanks, and belly-pieces, &c., pared off, is called a *butt*; the pieces cut off constitute the *offal*; and *skins* are all the lighter forms of leather, such as sheep, goat, deer, &c.

Besides the ox and cow hides furnished by the home-trade, vast numbers are imported from Montevideo, Buenos Ayres, Russia, and Northern Germany, and a very considerable number of dry buffalo-hides are brought from the East Indies. The number of all sorts imported into Great Britain, in 1862, amounted to about two millions and a half; and the entire value of the hides and leather imported in 1861 amounted to £3,891,783. These

returns, however, comprise a considerable number of horse-hides, which are also sent from South America. Calf-skins and kip-skins (that is, the skins of beasts older than calves, but not full-grown oxen) are, when tanned, used chiefly for the upper-leather of boots and shoes.

Sheep and lamb skins are imported (in the wool) in large quantities from Australia and the Cape of Good Hope; and tanned, from our East Indian possessions. The latter, with the Cape skins, are used for bookbinding, furniture, gloves, &c. Lamb-skins are imported also from Italy, Sicily, and Spain, and tawed and dyed for making gloves, in imitation of kid. A great portion of all sorts of lambs and sheep are tawed and used for masons' aprons, sewing harness, plaister-skins, tying up bottles, lining shoes, and other jobbing and inferior purposes.

Deer-skins are dressed by the oil process, and form a great portion of the so-called *chamois* leather, which derives its name from the chamois of the Alps, from the skin of which it was formerly made.

Dog-skins are tanned or tawed for gloves, and for thin shoes and boots. *Seal-skins* are manufactured into the so-called 'patent leather,' by varnishing their upper surface. The manufacture of this kind of leather has of late become of great importance to the London, Edinburgh, and Newcastle tanners.

Hog or pig skins are imported from Russia and other continental countries, and many are supplied by Scotland; their use is chiefly in the manufacture of saddles for horses, &c.

Walrus and hippopotamus hides are tanned in considerable numbers for the use of outlers and other workers in steel goods, 'buffing-wheels' being made of them, often an inch thick, which are of great importance in giving the polish to metal and horn goods. Lately, belts for driving machinery have successfully been made from them.

Kangaroo-skins of various species are tanned or tawed in Australia, and form a kind of leather in great favour for gentlemen's dress-boots.

The first process in making *tanned sole leather* is to soak the skins or hides in water for a greater or less time, to wash and soften them; they are then laid in heaps for a short time, and afterwards hung in a heated room, by which means a slight putrefactive decomposition is started, and the hair becomes so loose as to be easily detached. This process of 'unhairing' is mostly followed in America; but in Great Britain, milk of lime is used for soaking the hide till the hair loosens. Hides or skins intended for dressing purposes, such as shoe, coach, harness, or bookbinding, after the hair is taken off by lime, have to be submitted to a process called 'bating,' for the purpose of reducing the thickening or swelling occasioned by the introduction of the lime, and for cleansing the skin from grease and other impurities. This is effected by working the skins in a decoction of pigeons' or dogs' dung and warm water, and no dressing-leather is ever submitted to bark or shumac without undergoing this process.

If the old method of *tanning* is followed, the hides, after unhairing, are placed in the tan-pits, with layers of oak-bark or other tanning materials between them; and when as many layers of hides and bark are arranged as the pit will hold, water is let in, and the hides remain to be acted upon by the tanning material for months, and even in some cases for years, being only occasionally turned. But this primitive process is now rarely carried out; so much improvement has been effected in the tanner's art since its chemical principles were discovered,

that much less time suffices; and materials are now used which act so much more quickly than oak-bark alone, that even if the old process is used, it is greatly accelerated. The most useful of these materials are catechu and cutch (of which 9000 tons are annually imported into Great Britain from India and Singapore), gambier (about 1200 tons, from Singapore), divi-divi (3000 tons, from Maracaibo, &c.), valonia (the acorns of the *Quercus Ægylops*, 23,000 tons of which are yearly imported from Turkey), and sumach leaves (20,000 tons, chiefly from Turkey).

The first attempts at improvement in tanning were the method invented by Mr Spilsbury in 1823, and the improvement on this method by Mr Drake, of Bedminster, in 1831. The principle consisted in causing the *ooze* or *tan-liquor* to filter through the hides under pressure. For this purpose, in Drake's process, the edges of the hides were sewed up so as to form a bag. The bags being suspended, were filled with cold tan-liquor, which gradually filtered through the pores of the hides, and impregnated them with the tannin. The processes by infiltration, however, have been entirely abandoned for heavy leather, as they have the effect of rendering the leather porous and deficient in firmness.

Various patents for improvements in tanning have been in operation of late years. Herepath and Cox, of Bristol, tied hides to each other to form a long belt, and pressed them between rollers, to squeeze out the partially exhausted tan-liquor from the pores, so that a stronger liquor might be absorbed. Messrs J. and G. Cox, of Gorgie Mills, near Edinburgh, made an improvement on this mode, by attaching the hides to a revolving drum, so that the hides press on each other on the top of the drum, but hang suspended in the tan-liquor from the lower part; and thus, by the hides being alternately in and out of the liquor, the tanning is quickly effected.

After the hides have become thoroughly tanned in the pit by the action of the tannic acid upon their gelatinous substance, and when partly dried (if for 'struck' sole-leather), they are operated upon by a two-handled tool with three blunt edges, called a pin (fig. 2, and section, *a*), which, by being

Fig. 2.

rubbed with great pressure backwards and forwards on the grain-side of the leather, makes it more and more compact; and this is still further accomplished by submitting the leather to the action of a heavily loaded brass roller.

The tanning of goat-skins (from which our morocco is made), sheep for imitation-morocco, and small calf-skins for bookbinding, is done by sewing up the skins, and filling the bag with a decoction of shumac in a warm state. They are kept in an active state for twenty-four hours or so, which sufficiently saturates them.

A process has been patented by Mr Praller, of Bermondsey, within the last ten years, by which the heaviest skins are converted into leather in a very short space of time; but the process is tawing rather than tanning, and is used for machinery-belts principally.

Tawing consists in dressing the skins with antiseptic materials, so as to preserve them from decay; but by this operation no chemical change is effected in the gelatine of the skins; hence, tawed leather

can be used in the manufacture of glue. In tawing, the first process is careful washing, next dressing them with lime, then removing the hair or wool, and lastly, steeping them in some one or more of the various mixtures which are used for converting skins into leather by this method. The method of tawing lamb-skins will give a fair idea of the process, which is, however, much varied, according to the kind of skin and the experience of the worker. Lamb-skins of home-production are generally limed on the flesh-side with cream of lime, which enables the wool to be easily pulled off. Dried lamb-skins are generally submitted to the *heating process*, to get the wool removed. The pelts, after being washed, are rubbed on the convex piece of wood called the *beam*; and when supple, the flesh-side of each skin is thickly besmeared with a cream of lime; and when two are so treated, they are laid with the limed surfaces in contact; and a pile of them being made, they are left for a few days, when they are examined by pulling the hair. If it separates easily, then the lime is washed out, and the hair is removed with the unhairing knife (fig. 3), as in the case of hides,

Fig. 3.

unless it is required to be kept on, as in the case of skins for door-mats, &c. After thorough cleansing, the pelts are steeped for two or three weeks in a pit filled with water and lime, being taken out from time to time, and drained on sloping benches. When removed finally from the lime-pit, the skins are worked with the knife, to render them still more supple, and they are then put into the *branning* mixture. This consists of bran and water, in the proportion of two pounds of bran to a gallon of water. From this mixture, in about two days, they are transferred to another bath, consisting of water, alum, and salt. After the proper amount of working in this mixture, they undergo what is called the *pasting*, if intended to form white leather. The *paste* is a mixture of wheaten-bran and sometimes flour and the yolks of eggs. They are usually worked in a rotating cylinder with this paste and water, and are found in time to have absorbed the paste, leaving little more than the water. If the skins are not intended to be white, other materials are often used, and much pigeons' and dogs' dung is employed, some large leather-dressers expending as much as £100 per annum upon each of these materials. Lastly, the skins are dried and examined, and, if necessary, the *pasting* is repeated; if not, they are dipped into pure water and worked or staked by pulling them backwards and forwards on what is called a *stretching* or *softening* iron, and smoothed with a hot smoothing-iron.

Another kind of dressing is by treating the skin with oil. By hard rubbing with cod oil, or by the action of 'stocks,' after the skin has been properly cleaned with the lime, the oil works into the skin, displaces all the water, and becomes united with the material, rendering its texture peculiarly soft and spongy. Wash-leather or chamois-leather is so prepared, and for this purpose the flesh-halves of split sheep-skins are chiefly used.

Besides *tanning* and *tawing*, many kinds of leather require the currier's art to bring them to the state of completion required for various purposes. The currier receives the newly tanned skins, and finds them harsh to the feel, and rough on the flesh-side. He removes all the roughness by carefully shaving with a peculiar knife. After a soaking in clean water, he then scrapes the skin with considerable

LEATHER—LEAVES.

pressure upon a scraping-tool or *slicker*, and thus removes any irregularities. The moisture is then removed as much as possible, and oil, usually cod-oil and tallow, are rubbed over the leather, which is laid aside to dry completely, and as the moisture leaves it, the oil penetrates. When quite dried and saturated with the oil, the skin is rubbed on a board with rounded ridges, by which a peculiar grained appearance is given, and the leather is rendered very pliable. In currying, almost every variety of leather requires some variation in the processes employed, but the currier's object is in all cases to give a suppleness and fine finish to the skins.

Morocco leather, formerly an article of import from the Barbary coast, is now prepared in large quantities in this country, from goat-skins; sheep-skins also are used for imitation. It is always dyed on the outer or grain side with some colour, and the leather-dresser in finishing gives a peculiar ribbed or a roughly granulated surface to it, by means of engraved boxwood balls which he works over the surface.

Russia leather is much valued for its aromatic odour, which it derives from the peculiar oil of the birch-bark used in tanning it. The fact that this odour repels moths and other insects, renders this leather particularly valuable for binding books; a few books in a library, bound in Russia leather, being effective safeguards against insect enemies. It is also said to destroy or prevent the vegetable evil called mildew, to which books are so very liable.

LEATHER, VEGETABLE, is a composition, the base of which is supposed to be oxidised oil. It is spread over cotton or other cloth, and is used as a water-proof material for carriage-hoods, seats, gaiters, boots, &c. At present, it is only made by one company, which holds the secret of its manufacture.

LEATHERWOOD (*Dicra palustris*), a deciduous shrub of 3–6 feet high, with the habit of a miniature tree, a native of North America. It belongs to the natural order *Thymelæaceæ*. The bark and wood are exceedingly tough, and in Canada the bark is used for ropes, baskets, &c. The leaves are lanceolate-oblong; the flowers are yellow, and appear before the leaves.

LEAVE AND LIOENCE, a phrase in English law to denote that leave or permission was given to do some act complained of. It is a common defence in actions of trespass.

LEAVEN, 'sour' dough, or dough in which putrefaction has begun, and which, owing to the presence and rapid growth or multiplication of the yeast-plant, quickly communicates its character to fresh dough with which it is mingled, causing the process of fermentation to take place sooner than it otherwise would. The use of leaven in baking dates from a very remote antiquity; the employment of yeast is more recent. See **YEAST** and **BREAD**.

LEAVENWORTH, a city of Kansas, United States of America, founded in 1854, on the right bank of the Missouri River, 25 miles above Kansas City. It is a handsome town, of broad avenues, lighted with gas, with 12 churches, 8 banks, 11 hotels, 3 daily, and 5 weekly papers, one of which is German, and one French, with large mills and factories. This is the head-quarters of the government contractors for trains across the plains to Utah, New Mexico, &c., who employ 6000 teamsters, and 45,000 oxen. Pop. (1860) 7429.

LEAVES (*folia*) are organs of plants, springing from the sides of the stem or branches, generally more or less flat and green, never bearing flowers, and of great use in the vegetable economy, as

exposing the sap to air and light on their extensive surfaces. It is usually in the Axils (q. v.) of leaves that buds and branches are developed; and with reference to buds and branches, they are never situated otherwise than beneath them, although in the axils of many leaves no development of bud or branch ever takes place. After its full development, a leaf retains its form and size unchanged till its death. As to the duration of their life, leaves exist either for one year—that is, during a year's period of active vegetation—in which case they are called *Deciduous* (q. v.), or for more than one year, when they are called *Evergreen* (q. v.).

A leaf first appears as a little conical body pushed out from the stem or branch. At first, it consists entirely of cellular tissue, continuous with the bark, but vascular tissue afterwards generally appears in it. When fully developed, it usually consists of two parts: an expanded part, called the *blade* or *limb*; and a stalk supporting this part, and called the *leaf-stalk*, or *petiole*, which sometimes assumes the form of a *sheath* of the stem, as in grasses. The leaf-stalk, however, is often wanting, in which case the leaf is called *sessile*; and when the base of the leaf embraces the stem, it is called *amplexicaul*. A leaf which has a leaf-stalk is called *petiolate*. Sessile leaves often extend in wing-like prolongations down the stem, and are then called *decurrent*. They are sometimes *perfoliate*, entirely surrounding the stem with their base, so that it seems to pass through the leaf. Opposite leaves are sometimes combined in this way. Leaves are called *simple*, when all their parts are united into one whole by a connected cellular tissue; they are called *compound*, when they consist of a number of distinct, completely separated parts, which are called *leaflets*.—As to the place where leaves arise from the stem, they are either *radical* (root-leaves), when they arise from the very base—and many plants have radical leaves only; or *cauline* (stem-leaves), when they arise from the *developed* stem or branches—the radical leaves really arising from the stem; or *floral*, when they arise from the flowering axis.—As to their arrangement on the stem, leaves are *verticillate*, or *whorled*, or *opposite*, or *alternate*, or *scattered*. Opposite leaves are usually placed so that each pair is at right angles to those next above and below. All these modes of arrangement on the stem can be reduced either to the *whorl* or to the *spiral*; whilst by the tearing out of the whorl, the spiral arrangement arises, and the whorl by the compression of the spiral, but so that the whorl and the spiral are essentially the same. The number of leaves requisite to form a complete *cycle*, or to encircle the stem, is very constant in the same species. In the Common Houseleek, the cycle consists of no fewer than thirteen leaves, which are grouped together to form the *rosette* of this plant.

Leaves consist either exclusively of cellular tissue, as in mosses, or, more generally, of cells and bundles of spiral vessels, as in the leaves of trees and most other phanerogamous plants. The stronger bundles of vessels form *nerves*, externally conspicuous, the finer ramifications of which are called *veins*. In endogenous plants, the nerves of the leaves run mostly in straight lines, and nearly parallel; whereas, in exogenous plants, a net-like ramification of the nerves prevails.

The leaves of phanerogamous plants and ferns are covered with a well-developed separable *epidermis*, which extends over all their parts, and which is provided with numerous small pores—*Stomata* (q. v.)—sometimes on one, sometimes on both sides, serving for the absorption and exhalation of gaseous substances. Submerged leaves, however, and the under side of leaves which float on the surface of

LEAVES.

water, have no stomata, no true epidermis, and no true vascular tissue.

Some plants have no leaves, their functions being performed by the green juicy rind of the stalks, as in *Cactaceae* and some of the genus *Euphorbia*; or by the general surface of the Thallus (q. v.) in many acrogenous plants.

It is in the leaves of plants that the elaboration of the sap chiefly takes place, and when a tree is deprived of its leaves, no wood is formed until they are again developed. The incessant removal of leaves as they are formed destroys a plant, and this method is sometimes advantageously adopted as to woods having deep or spreading perennial roots, and otherwise difficult of extirpation.

Leaves exhibit more or less decidedly a periodical alternation in their direction and expansion, generally corresponding with the alternation of day and night. Some leaves exhibit a peculiar irritability under various influences, and those of two or three

species of plants, by their closing together, catch and kill insects which alight on them, a thing, however, of which no relation to the vegetable economy is known. See *IRRITABILITY IN PLANTS*, *SLEEP OF PLANTS*, and *DIONÆA*.

The forms of leaves are extremely various. Simple leaves vary from a form almost perfectly circular, or even broader than long, to an extreme elongation, as *linear* or *filiform* (thread-like). The breadth of some increases towards the apex, and this is indicated by the terms *obovate*, *obcordate*, &c., and sometimes by the word *inversely* prefixed to the term which describes the form. Simple leaves are either *entire*, or they are more or less deeply *toothed* or *serrate*; or they are cut or *lobed* by divisions extending from the margin towards the base; or the division may extend towards the midrib of the leaf, when the leaf is *pinnatifid*, or *sinuate*, or *runcinate*, &c. The accompanying figure exhibits some of the forms of leaves, and explains more

Forms of Leaves:

1, cordate; 2, ovate; 3, lanceolate; 4, hastate; 5, sagittate; 6, linear; 7, subulate; 8, pectinate; 9, lyrate; 10, digitate; 11, palmate, or quinate; 12, serrate; 13, impari-pinnate; 14, sinuate; 15, runcinate.

briefly than words could, some of the terms used in describing them. Similar terms are employed as to the leaflets of compound leaves, but the variety of forms is not nearly so great. Compound leaves exhibit two chief varieties of form, according as the divisions which form the leaflets extend towards the base of the blade, or towards the

midrib. Of the former class are *ternate*, *quaternate*, *quinate* leaves, &c.; the latter are called *pinnate* leaves. But the same mode of division may be repeated in the leaflets, and thus a leaf may be *binate*, or, if again divided, *trinate*, &c., and very many leaves are *bipinnate*, *tripinnate*, &c. When the division is often repeated, the leaf is

called *dissempennate*. A pinnate leaf, terminating in a pair of leaflets, is called *puri-pinnate*, or *abruptly pinnate*; but a pinnate leaf very often terminates in an odd leaflet, and is then called *imperi-pinnate*. The blade of a leaf is generally in the same plane with the stalk, but is sometimes at right angles to it, as in *orbicular* and *petiolate* leaves.

The *Fernation* (q. v.) of leaves, or the manner in which they are folded in bud, is, like the *anthesis* of flowers, very characteristic of different plants and tribes of plants.

Stem-leaves are generally larger than *stem-leaves*, but are only present in herbaceous plants, and are generally the first to fade. The upper stem-leaves are generally smaller and less divided than the lower, those nearest the flowers often passing into bracts. By metamorphosis of leaves, all bracts, involucre, &c., are produced, and all the different parts of flowers, as calyx, corolla, stamens, carpels, and therefore even fruits; and the mode of their arrangement relatively to the axis corresponds with that of leaves. All organs formed by metamorphosis of leaves are called *leaf-organs*. See *MORPHOLOGY*.

Seed-leaves are the cotyledons of the seed, raised above ground after germination, and serving the purpose of leaves to the young plant, although generally very unlike its future leaves. This, however, only takes place in some plants.

LEBANON, *MOUNT*, or **JEBEL LIENAN**, the western and higher of two mountain-chains which run through Syria from north to south parallel with the coast of the Levant. Its average height is about 7000 feet, but its loftiest peak, Dahral-Khotik, in the range called Jebel Makmel, attains an elevation of 10,080 feet. For six months of the year, this mountain is covered with snow. The next highest point is Jebel Sunnia, 8555 feet. The road from Baalbek to Tripoli crosses L. at an elevation of 7330 feet. From the western side of the range, several spurs strike off across the narrow strip of level coast, and project upon the Levant in bold promontories. In the south are the sources of the Jordan, the most important river that rises in Lebanon; not far from Dahral-Khotik, those of the Orontes, the next largest stream, which flows northward, and intersects the chain at Antaki (*Antioch*). L. derives its name, not from the snow that whitens its peaks, but from its chalk cliffs. The vegetation of L. is, on the whole, scanty; here and there, woods and willow-groves are seen; the lower parts of the mountains, however, are everywhere well watered and cultivated, and the valleys are often covered with orchards, vineyards, olive and mulberry plantations, and cornfields. The habitable districts are mostly in the possession of Maronites (q. v.) and Druses (q. v.). Everywhere the range of L. is wild and solitary; the only sound that falls upon the ear of the traveller is the scream of the eagle. Numerous monasteries offer comfortable accommodation to the weary traveller at the close of almost every day's wanderings. The once famous Cedars of L. have almost disappeared; only a solitary grove remains. See **CEDAR OF LIBANON**.

ANTI-LEBANON, or *Jebel-ant-Sharhi*, lies east of the preceding; the range is less compact, and its average height inferior. The great plain between the two is known as *Oasis-Syria* (q. v.). Anti-Lebanon terminates southwards in Mount Hermon, its highest point, which reaches an elevation of 8378 feet. Its sides are clothed with green poplars, but it has no cedars. On its table-lands are found numerous little lochs or tarns, which are a characteristic feature of this range, and distinguish it from Mount Lebanon.

LEBEDIA'N, a district town of Great Russia, in the government of Tambov, 100 miles west-north-west of the city of that name, on the Don, in lat. 53° N. It has two annual fairs, the commercial transactions of which realize £700,000. One of the chief articles of sale is horses; and government officers frequent the fairs of L., in order to furnish horses for the cavalry regiments.

LEBEDIN, a town of Little Russia, in the government of Kharkov, 90 miles north-west of the town of that name, in lat. 50° 35' N., long. 34° 30' E. It was founded in the 17th century. Pop. 13,577, who manufacture girdles and sashes to the value of many thousand roubles. These articles, which are worn by the Russian peasants, are sent for sale to Moscow, and to the fairs of Nijni-Novgorod, Kursk, &c.

LEBRUN, CHARLES, a French painter, born at Paris, March 22, 1619, studied in the school of Vouet, and afterwards at Rome, under Poussin, for six years, returning to France in 1648. He became principal court-painter to Louis XIV., and died at Paris, February 12, 1690. L.'s best works are a series of pictures representing the battles of Alexander, which were felicitously engraved by Gérard Audran. L. belongs to the classical and artificial school, but he is a very favourable specimen of it.

LECOCE, the chief town of a district of the same name in the province of Terra di Otranto, in Southern Italy, 10 miles from the Adriatic, and 25 south-south-east of Brindisi, has a population of 12,400. It is the *Lepice* of the ancient Salentines, the name having become *Lycia* in the middle ages, and hence *Leoca*. It contains fine churches and public edifices, the architecture of which is much enhanced by the beauty of the fine white stone found in abundance in the neighbourhood, which admits of exquisitely minute cutting. L. has a large trade in olive-oil.

LECOMPTON, the capital of Kansas, United States of America, is situated on Kansas River, 60 miles from its mouth at Kansas City. It contains the state capitol, United States Land Office, and other government buildings. Pop. about 1600.

LECTERN, or **LETTERN** (*Lat. lectionem* or *lectionis*), a reading-desk or stand, properly movable, from which the Scripture lessons (*lectiones*), which form portions of the various church-services, are chanted or read. The lectern is of very ancient use, of various forms, and of different materials. It is found both in Roman Catholic churches and in the cathedrals and college-chapels of the Church of England. The most ancient lecterns are of wood, a beautiful example of which is that of Ramsey Church, Huntingdonshire (about 1450), represented in the wood-cut; but they were frequently also made of brass, and sometimes in the form of an eagle (the symbol of St John the Evangelist), the outspread wings of which form the frame

Lectern.

supporting the volume.—In some parts of the east of Scotland, the precursor's desk in the Presbyterian churches is called the *lectern*.

LECYTHIDACEÆ, a natural order of exogenous plants, or sub-order of *Myrtaceæ*, the distinguishing characteristic being that the fruit is a large woody capsule, with a number of cells, which in some species remains closed, and in some opens with a lid. All the known species, about forty, are natives of the hottest parts of South America. All are large trees. They have alternate leaves, and large showy flowers, solitary, or in racemes. The stamens are numerous, and a portion of them sometimes connected into a kind of petal-like hood. Brazil Nuts (q. v.) and Sapucaia Nuts (q. v.) are the seeds of trees of this order. The Cannon-ball Tree (q. v.) belongs to it. The capsules of some species are known as *monkey-pots*, *Monkeys* are very fond of the seeds.

LEDA, in Grecian Mythology, the wife of the Spartan king Tyndareus, whom Jupiter visited one night in the disguise of a swan. She became by the god the mother of Castor and Pollux, and after her death, was raised to a divinity under the name of Nemesis. The story has supplied a theme for many works of art.

LEDBURY, a small town of England, in the county of Hereford, is situated fourteen miles east-south-east of the city of that name, on the Hereford and Gloucester canal. Glove-making is the principal branch of industry. Pop. (1861) 3263.

LEDGER-LINE, a kind of tackle used in fishing. It consists of a bullet or piece of lead with a hole through the centre; through which a gut-line is threaded, having at the end of it a hook. About 18 or 20 inches above the hook, a shot or bead is fastened firmly to the line, to prevent the lead from slipping down the line nearer to the hook. The hook being baited, the tackle is then cast into the water. The lead rests on the bottom, and the line is kept tight, but without lifting the lead off the bottom. The moment a fish bites at the bait, it is felt by the angler, who immediately gives a strong pull or strike. This method of fishing is used chiefly for barbel or bream.

LEDRU-ROLLIN, ALEXANDRE AUGUSTE, a noted French democrat, was born in Paris in 1808, and studied for the bar, to which he was admitted in 1830. He was counsel for the defence in most of the prosecutions of opposition journals during the reign of Louis Philippe, and obtained a great reputation for eloquence among the lower orders. In 1841, he was elected deputy by the department of Sarthe, and became a prominent member of the extreme Left. In 1846, he published a Socialistic manifesto, entitled *Appel aux Travailleurs*, in which he declared 'universal suffrage' to be the only panacea for the miseries of the working-classes. He was also an ardent, or even a violent promoter of the reform-meetings that preceded the crash of 1848. On the outbreak of the revolution, he opposed the proposal of a regency, advocated the formation of a Provisional Government, and when this was carried out, was intrusted with the portfolio of the Interior. He was afterwards one of the committee of five in whose hands the National Assembly placed the interim government of the country. In this high position, he shewed great want of perception, firmness, and energy. In consequence of the insurrection of June 1848, he ceased to hold office, and then sought to recover (what he had lost by accepting office) his influence with the extreme democrats. He partially succeeded in his attempt, and even ventured on a candidature for the presidency, but obtained only 370,119

votes. The unsuccessful *émeute* of June 1849 put an end to L.-R.'s political rôle in France. He fled to England; and in less than a year politely published a work against the land which had given him an asylum, *De la Décadence de l'Angleterre* (2 vols. Par. 1850). He has also written a great many pamphlets, treatises, letters, &c., which do not possess any permanent interest.

LEDUM, a genus of plants, of the natural order *Ericæ*, sub-order *Rhodroë*, consisting of small evergreen shrubs with comparatively large flowers, of which the corolla is cut into five deep petal-like segments. The species are natives of Europe and North America; some of them are common to both. The leaves of *L. latifolium* are said to be used in Labrador as a substitute for tea, whence it is sometimes called *LAPRADOR TEA*. Sir John Franklin and his party, in the arctic expedition of 1819–1822, used in the same way the *Ledum palustre*, which produced a beverage with a small resembling rhubarb, yet they found it refreshing. The leaves of both these shrubs possess narcotic properties, and render beer heady. They are regarded as useful in agues, dysentery, and diarrhœa.

LEE, or **LEEWARD**, a nautical term for the quarter to which the wind is directed, as distinguished from *windward*, or the part whence the wind comes.

LEE, the name of a distinguished Virginian family. Their ancestor, RICHARD LEE, emigrated with a numerous household to America, in the reign of King Charles I., and settled in the country lying between the Rappahannock and Potomac rivers. He was a bold royalist, and during the Protectorate of Cromwell, was mainly instrumental in inducing the colony of Virginia to assume a semi-independent attitude.—RICHARD HENRY LEE, great-grandson of the preceding, and the most illustrious member of the family, was born at Stratford, in Virginia, January 20, 1732. He was educated first at home, and afterwards in England. He did not come prominently before his countrymen till after the British parliament had passed (1764) the act declaring its right to tax the colonies, and also the Stamp Act (1765), when he immediately became the centre of an active opposition among the colonists, associated himself with Patrick Henry (q. v.), and drew up most of the 'resolutions' of the period. He was sent as a delegate from Virginia to the first American Congress, which met at Philadelphia (September 5, 1774), and at once became a leader in the assembly. He wrote most of those addresses to the king, the people of England, and the colonies, which compelled the great Chatham to admit, that 'for solidity of reasoning, force of sagacity, and wisdom of conclusion, under such complication of circumstances, no nation or body of men can stand in preference to the general congress at Philadelphia.' When war between the mother-country and the colonies became inevitable, Lee was placed on the committees charged with preparing the munitions of war, and with devising all other means of offering a vigorous resistance to the British government. His labours at this time were enormous. On the 7th of June 1776, Lee made the most celebrated (and important) of all his speeches, when introducing before the congress of Philadelphia a measure declaring the 'united colonies' to be 'free and independent states,' and 'absolved from all allegiance to the British crown.' During the war of independence, he was—in spite of ill-health—one of the most active of the patriotic party, chiefly, however, as a civilian. In 1784, he was elected president of congress, and when the federal constitution was established, he entered the senate for Virginia.

Towards the close of his career, he became a decided federalist, although originally he had viewed that system of government with great suspicion, as tending towards a despotic centralisation of power. In 1792, he retired from public affairs, and died in his native state, June 19, 1794. His *Life and Correspondence* was published by his great-grandson, R. H. Lee (2 vols. Philadelphia, 1825).—LEE, ARTHUR, youngest brother of the preceding, was born in Virginia, December 20, 1740. He was educated at Eton, then studied medicine at Edinburgh, and after travelling on the continent for some time, returned to America, and started as a physician. Circumstances, however, soon drew him into the field of politics; he returned to England, advocated the rights of the colonies in the English newspapers, and in 1776, took up his residence at Paris, as the secret agent of the American congress. In this capacity, he was busily employed during the whole struggle, and conducted his business on the continent greatly to the advantage of the colonists. He died December 12, 1792. Lee, like his brother, was an admirable scholar and writer, enjoyed the friendship of some of the most eminent men of his time, Burke, Wyndham, Sir William Jones, the Abbé Raynal, and the Duke de Rochefoucauld. See *Life and Correspondence*, by R. H. Lee (2 vols. Boston, 1829).—LEE, HENRY, a distinguished American general, whose father was cousin of the preceding, was born in Virginia, January 29, 1756. He was one of the most daring, vigilant, and successful cavalry officers on the side of the colonists. 'Lee's Legion' was probably the most effective and courageous body of troops raised in America. In the famous retreat of Greene before Lord Cornwallis, it formed the rear-guard, the post of honour, and covered itself with glory. At the battles of Guilford Court House and Eutaw, at the sieges of Forts Watson, Mott, and Granby and Augusta, and at the storming of Fort Grierson, Lee particularly signalled himself. After the war, he was sent to congress as a delegate from Virginia, advocated the adoption of a federal constitution, and in 1792, was chosen governor of Virginia. In 1809, he published a valuable work, entitled *Memoirs of the War in the Southern Department of the United States*. He died at Cumberland Island, Georgia, March 25, 1816.—LEE, ROBERT E., General and Commander-in-chief of the army of the Confederate States of America, is a son of the preceding, and was born in Virginia about 1810. He was educated at the military academy of West Point, entered the army of the United States, served as captain of engineers under General Scott in the war with Mexico, was raised to the rank of lieutenant-colonel, and brevetted colonel for distinguished services. He was employed in the office of the commander-in-chief at Washington when Virginia seceded from the Union, April 1861, when he resigned his commission, and was appointed commander-in-chief of the forces of Virginia. When that state entered the Confederacy, he was appointed to its highest military rank of general, and though not the senior, was selected by President Davis as commander-in-chief. In July 1862, he defended Richmond against the Federal army under General McClellan, and after six days of sanguinary battles, drove him to the shelter of his gun-boats. Marching north, he defeated General Pope, August 29, in the second battle of Manassas. Crossing the Potomac into Maryland, with a force of 40,000, he was met at Antietam by General McClellan with 80,000, and after a bloody but indecisive conflict, September 17, recrossed the Potomac, and took a position at Fredericksburg, on the Rappahannock, where, December 13, he was attacked by General Burnside, whose army he defeated with great slaughter.

General Hooker, the successor of General McClellan, Pope, and Burnside, whom Lee had successively defeated, crossed the Rappahannock, May 1, 1863, and was attacked by General Lee on the 2d and 3d, routed with heavy loss, and compelled to escape in the night across the river. More recently, he has carried the war into the northern states, but with what result remains to be decided. General Lee married the adopted granddaughter and heiress of Washington, by whom he has five sons, all soldiers in the Confederate service—one a general, another a colonel, and the youngest, a boy of 18, a private artillery volunteer in the army under his father's command.

LEE, SAMUEL, D.D., an English orientalist and linguist, was born, 14th May 1783, at Longnor, in Shropshire, studied at Queen's College, Cambridge, and took his degree of B.A. in 1817. Two years after, he was chosen Arabic Professor in the same university, obtained the degree of D.D. from Halle (unsolicited) in 1822, and from Cambridge in 1833, was appointed Regius Professor of Hebrew in 1831, and died rector of Barley, in Hertfordshire, 16th December 1852. His *Grammar of the Hebrew Language* (2d ed. Lond. 1831), his *Book of Job, translated from the Original Hebrew* (3 vols. Lond. 1837), his *Hebrew, Chaldaic, and English Lexicon* (Lond. 1840), his translation from the Arabic of the *Travels of Ibn-Batuta* (Lond. 1833), have secured for him a very high reputation. His *Sermons on the Study of the Holy Scriptures* (1830), and *Events and Times of the Visions of Daniel and St John* (Lond. 1851), are also highly esteemed. He took charge, for the British and Foreign Bible Society, of editions of the Syriac Old Testament, and of the Syriac New Testament, or Peshito, of the Malay, Persian, and Hindustani Bibles, and of the Psalms in Coptic and Arabic.

LEE, FREDERICK RICHARD, R.A., an English landscape painter, born at Barnstaple, in Devonshire, about the close of last century, and first exhibited at the Royal Academy in 1824. He became an A.R.A. in 1834, and an R.A. in 1838. Lee is one of the most thoroughly national painters of his day, the characteristic scenery of his native country, its quiet river-banks, its parks, its leafy lanes, and its picturesque villages, forming the favourite subjects of his pencil. Among his best known and most admired pictures are 'The Broken Bridge,' 'The Mill,' 'The Watering-place,' 'The Fisherman's Haunt,' 'The Silver Pool,' 'The Ploughed Field,' 'A Devonshire Village,' 'A Village Green,' 'Cover Side,' 'Harvest Field,' 'A Devonshire Lane,' 'Penshurst Avenue,' 'Avenue in Shobrook Park.' Among his latest works are 'The Bay of Biscay,' 'Plymouth Breakwater,' 'View of Gibraltar from the Sands.' In 1848, he began to paint a series of works along with S. Cooper, the cattle-painter—the former executing the landscape, and the latter the animals.

LEECH, JOHN, an English artist, was born in London about 1816, and received his education at the Charter House. The reputation of this artist is almost entirely associated with *Punch*, to which, by this time, he has contributed many thousand humorous sketches. These sketches are frequently as full of grace as of humour; the drawing is often excellent; and his female faces have a quiet, healthful beauty, which would be attractive in the ball-room, but more attractive by the fireside and with children on the knee. In the *Punch* sketches, he has satirised keenly, yet on the whole humanely, the vagaries of male and female attire, the precocity of the young, the pomp of Paterfamilias, the pride of domestic

servants, and the singular relations which sometimes subsist between the parlour and the kitchen. To the future historian of the Victorian era, these hasty sketches will be invaluable.

L. has published, in a separate form, *The Rising Generation* (1848), and *Pictures of Life and Character* (1854), the latter being a collection of his most successful *Punch* contributions.

LEECH (*Hirudo*), a Linnean genus of *Annelida*, of the order *Suctorio*, now forming the family *Hirudinidae*, and divided into a number of genera, some of which contain many species. They are mostly inhabitants of fresh waters, although some live among grass, &c., in moist places, and some are marine. They are most common in warm climates. The body is soft, and composed of rings like that of the earthworm, but not furnished with bristles to aid in progression, as in the earthworm; instead of which, a sucking disk at each extremity enables the leech to avail itself of its power of elongating and shortening its body, in order to pretty rapid

therefore much more favourable for the health of leeches than the tanks and vessels formerly in use.

—The MEDICINAL L. (*H. medicinalis* or *Sanguisuga officinalis*) is a rare native of Britain; but leech-gathering is the occupation of some poor persons, particularly in Cumberland. Leeches, however, are generally imported from Hamburg and from the south of Europe. The collecting of leeches gives employment to many persons in some parts of Europe; and leech-gatherers sometimes adopt the simple mode of wading into the water, and seizing the leeches which attach themselves to their bare legs. Pieces of liver, &c., are sometimes used for bait, and a kind of net is sometimes used. Some parts of Europe are supplied from more eastern regions. Slight differences have led to the establishment of two species—one more northern, and one more southern—among those commonly imported into Britain. The more northern—which is that above named—has the belly spotted with black; the more southern (*H. provincialis*, or *Sanguisuga medicinalis* or *meridionalis*) has the belly unspotted. Other species are used for the same medicinal purpose of blood-sucking in other parts of the world. The ancients were well acquainted with leeches, but their medicinal use seems to have originated in the middle ages. Many millions of leeches are annually imported into Britain.—The HORSE-LEECH (*Hæmopsis sanguisuga*) is common in Britain; it is much larger than the medicinal species, but its teeth are comparatively blunt, and it is little of a blood-sucker—notwithstanding the popular notion—and useless for medicinal purposes. It feeds greedily on earthworms, which issue from the banks of the ponds or sluggish streams which it inhabits.—In many parts

locomotion. The mouth is in the anterior sucking disk. The mouth of many of the species, as of the common medicinal leeches, is admirably adapted not only for killing and eating the minute aquatic animals which constitute their ordinary food, but for making little wounds in the higher animals, when opportunity occurs, through which blood may be sucked. The mouth of the medicinal leech has three small white hard teeth, minutely serrated along the edges, and curved so as to form little semicircular saws, provided with muscles powerful enough to work them with great effect, and to produce a triradiate wound. The stomach is very large, and is divided into compartments, some of which have large lateral ones; and a leech which has once gorged itself with blood retains a store for a very long time, little changed, in these receptacles, whilst the digestive process slowly goes on. The circulating system consists of four great pulsating trunks, one dorsal, one ventral, and two lateral, with their branches; there is no heart. The aspiration of the blood takes place by numerous small apertures on the ventral surface, leading into respiratory sacs. Leeches are oviparous, and each individual is androgynous. They have small eyes—in the medicinal leeches ten—appearing as black spots near the mouth, and of the most simple structure. Leeches frequently change their skin; and one cause of the great mortality so often experienced among leeches kept for medicinal use, is the want of aquatic plants in the vessels containing them, among which to rub themselves for aid in this process, and for getting quit of the slime which their skins exude. Leech *aquaria* in which aquatic plants grow, are

Horse Leech.

of India, as in the warm valleys of the Himalaya, the moist grass swarms with leeches, some of them very small, but very troublesome to cattle and to men who have occasion to walk through the grass. Sir James E. Tennent's description of the land-leech of Ceylon (*Hæmaphysa Ceylanica*) is very amusing. In size, it is about an inch in length, and as fine as a common knitting-needle, but capable of distension to the thickness of a quill and a length of nearly two inches. It can innumerate itself

through the meshes of the finest stocking. It is always ready to assail a passing traveller or quadruped. The coffee-planters are obliged to wear leech-gaiters of closely-woven cloth for protection. Horses are driven wild by these pests, 'and stamp the

Land Leeches:
From Tennant's *Ceylon*.

ground in fury, to shake them from their fetlocks, to which they hang in bloody tangles.' The bare legs of palanquin-bearers are adorned with clusters of them like bunches of grapes. Their numbers have often occasioned the death of men compelled to spend days where they abounded. The moist valleys of Java, Sumatra, Chili, and other tropical countries, swarm with land-leeches as much as those of India and Ceylon.

LEECHING, or the application of **LEECHES** (q. v.), for the purpose of abstracting blood, is preferable to venesection or cupping in many forms of disease; as, for example—1. In local determinations of blood, unattended with febrile symptoms, as in acute inflammation of the female breast, when the pressure of the cupping-glass would cause intense pain. 2. In abdominal inflammations, especially in Peritonitis (q. v.), the application of leeches is often preferable to general blood-letting, particularly in patients of a weak constitution. 3. In various organic affections of the heart and lungs, leeching often affords great relief. Indeed, there are few diseases in which loss of blood is required, excepting erysipelas, in which the application of leeches is objectionable; although it is inexpedient, as compared with venesection, in those cases in which it is desirable to make an immediate impression on the disease (as in peritonitis in robust persons), or where the disease is very rapid and fatal (as in croup).

In the diseases of infants and young children, leeches must be applied with caution. Infants are sometimes completely blanched by the application of one or two leeches, and a case is recorded by Pelletan in which six leeches applied to the chest proved fatal to a child aged six years. In applying leeches, the part should be thoroughly cleaned, and the leeches, after being dried by rubbing them in a clean linen cloth, should be placed in an open pill-box, or in a wine-glass, and applied to the spot at which it is desired that they should attach themselves. When it is wished to affix a leech to the inside of the mouth, it is placed in a narrow tube called a leech-glass. When the animals will not attach themselves readily, they may sometimes be induced to bite by moistening the part with milk or blood.

The quantity of blood which a leech is capable of drawing may be estimated at an average at about a drachm and a half, although occasionally a leech will abstract between three and four drachms; and this quantity does not include that lost after the animal has fallen off, which is frequently, especially in children, very considerable. In order to cause the leech to disgorge the blood, the usual practice is to apply salt to its body.

When the leeches have fallen off, it is usually desirable to promote to some extent the flow of blood from their bites, and this is readily done by the application of warm fomentations or poultices. The bleeding generally stops spontaneously after a short time; if it goes on longer than is desirable, more exposure to the air, or the application of the fluff of a hat, or of a bit of cobweb, will usually check it, the fibrine of the blood coagulating on the applied filaments, and forming a small clot. If these means fail, a little cone of lint should be inserted into the bite, over which a compress should be laid and a bandage applied; or the bite should be touched with a stick of nitrate of silver (lunar caustic) scraped to a point.

Leeches, when applied to the mouth or interior of the nose, have been occasionally swallowed, and have given rise to very unpleasant symptoms. The best treatment in a case of this kind is to prescribe wine—half a glass, or even a glass, every quarter of an hour—which will speedily destroy the leech. A moderately strong solution of common salt would probably exert a similar fatal action on the animal.

LEEDS, the first town in Yorkshire, and fifth in England in point of population, is a parliamentary and municipal borough, being one of those which were enfranchised at the passing of the Reform Bill. It is situated in the north-west of the West Riding of Yorkshire, in the valley of the Aire, and is the centre of the clothing district. The extent of this and the other commercial pursuits of the town may be estimated from the following statistics of employments in L., as ascertained in 1858.

Employment.	Persons Employed.	Annual Total Wages.
Woolen manufacture,	16,163	£274,000
Worsted "	740	50,000
Flax,	3,000	120,000
Iron, and machine-making,	16,920	660,000
Iron-works and coal-miners,	3,000	120,000
Silk manufacture,	120	10,000
Paper "	115	15,000
Tobacco "	115	40,000
Clay-pipes, fire-bricks, &c.,	500	15,000
Earthenware,	500	35,000
Glass,	500	15,000
Oil,	500	35,000
Chemicals,	500	35,000
Leather,	2,000	100,000
Dyeing,	1,000	75,000

Public Buildings.—There are 86 churches in Leeds, of which 26 are in the town and 10 in the suburbs. Of these, 22 are parochial vicarages, and 14 are perpetual curacies. The chief is St Peter's, which is in Kirkgate, and was rebuilt in 1838 at a cost of £39,770. It is 180 feet long by 86 feet wide; the tower is 139 feet high, and contains a peal of 13 bells. It is a very noble edifice. The principal windows are of beautiful stained glass. It also contains some fine statues, one of which is erected in memory of those natives of Leeds who fell in the Crimea; the church has a good choir. The other principal buildings are chiefly of recent erection, and are as follows: The Town-hall is 250 feet long, 200 feet broad, and the tower is 225 feet high. It covers 5600 square yards. The great hall is 161 feet long, 72 feet wide, and 75 feet high. It is richly decorated, and contains one of the largest and most powerful organs in Europe, also statues of Edward Baines and Robert Hall, formerly members for the borough. There is also a colossal statue of the Queen in the vestibule, and of Wellington in the front of the building. Kirkstall Abbey, about three miles from L., was founded between 1147 and 1153 by Henry

de Lacie for the Cistercian order of monks. It is a fine old ruin, remarkable for its simple grandeur and unity of design. Adel Church, about four miles from L., is an interesting building, erected 1140. Near it was a Roman station, where several antiquities have been found. The Grammar-school was built in 1859, at a cost of £13,000. It is built in the shape of a cross in the Gothic style, decorated period, and was designed by E. M. Barry, Esq. The borough jail is a large castellated building at Armley, admirably adapted for its purpose. The Corn Exchange, a handsome building of an oval form; the Post-office, formerly the Court House, near which is a statue of Sir Robert Peel; the Queen's Hotel, recently erected by the Midland Railway Company; the Philosophical Hall, built in the Doric order of architecture, and having a fine museum, &c. The educational institutions comprise the Mechanics' Institute, founded 1824. It possesses a library of 12,000 volumes, reading-room and lecture-hall, day-schools, and evening classes; it has 1500 members. In connection with it is the School of Art, one of the most prosperous in the kingdom, and giving instruction in drawing to 3000 persons. The Working-Men's Institute, numbering, on an average, 2000 members: its attractions are lectures and entertainments, newspapers, indoor and outdoor games, refreshments at cost-price, all for a weekly subscription of 1d. Besides the above, there are about twelve smaller institutions for the promotion of popular instruction. There is also a library of 30,000 volumes, founded by Priestley in 1768. The number of subscribers is limited to 500. Among charitable institutions may be mentioned the Infirmary, which is about to be rebuilt on a new site from designs by George Gilbert Scott, R.A., and towards which upwards of £66,000 has been subscribed; the Dispensary; House of Recovery; Hospital for Women and Children; Tradesman's Benevolent Society; Industrial School, and handsome new workhouse; the Reformatory at Adel, where about 60 juvenile criminals are usefully employed in agricultural and other occupations. L. has also a Commercial News-room, a Stock Exchange, two general markets—one of which is a handsome structure of iron and glass—a cattle-market, coloured and white cloth halls, three railway-stations, seven banks, two theatres, one daily and three weekly newspapers. L. sends two members to parliament. Pop. in 1861, 207,165.

LEEK (*Allium Porrum*; see **ALLIUM**), a biennial plant, and a native of the South of Europe; with no proper bulb at the root, but generally a slight increase of the thickness of the stem; a stem about 3 feet high, leafy at bottom; the leaves about an inch wide; the flowers in a large and very dense terminal globular umbel, which is not bulbiferous. It has been long in cultivation, and some of the varieties exhibit the effects of cultivation in greatly increased size and delicacy. The lower part of the stem, before it has run up into a flower-stalk, blanched by earthing up or other means which also induce it to swell and extend, is much esteemed for culinary purposes. Its flavour is much milder than that of the onion, or any other species of *Allium*. The L. has long been an especial favourite of the Welsh; and much attention has of late been paid to its cultivation in some parts of Scotland. It is generally sown in spring, and is used during the following winter. It delights in a rich but light and dry soil. Gardeners often transplant seedling leeks, instead of merely thinning out the original rows; and sometimes make deep holes for them with the dibble, into which they merely throw a little earth to cover the roots, leaving the stem to swell in the open hole.

LEEK, a manufacturing and market-town of England, in the county of Stafford, 24 miles north-north-east of the town of that name. The parish church dates originally from 1180, and the town contains also numerous educational and benevolent institutions. Pop. (1861) 10,045, who are employed chiefly in the manufacture of silk goods.

LEET COURTS, in English Law, mean courts held in a manor, township, or hundred, for local purposes.

LEEUWARDEN, a town of the Netherlands, capital of the province of Friesland, in a rich and extensive plain, on the Harlingen and Gröningen Canal, 16 miles east-north-east of Harlingen. It contains a handsome town-hall, an ancient palace of the Princes of Orange, and many churches. Numerous canals intersect the town. L. has a society for the investigation of Frisian history, antiquities, and language, and another for the study of natural history. Linen fabrics and paper are manufactured, and a trade in horses is carried on. Pop. 24,461.

LEEUWENHOEK, or **LEUWENHOEK**, **ANTHONY VAN**, one of the earliest microscopic observers, was born at Delft, in Holland, in 1632, and died in the same town in 1723. The *compound microscope*, as it existed in his time, was very imperfect, and subject to many errors, which induced L. to employ only *simple microscopes*, that is to say, very small lenses of short focal length, which were fixed between two plates of metal that had been pierced with a very narrow opening. He bequeathed to the Royal Society of London (where they are carefully preserved) a collection of these microscopes. It was in the *Philosophical Transactions* of this Society, to which he contributed 112 papers, that most of his observations were originally published.

Amongst the most important of his investigations may be mentioned a Memoir communicated to the Royal Society in 1690, in which he discovered, and clearly demonstrated, the continuity of the arteries and veins through intervening capillaries, and thus afforded ocular demonstration of the truth of Harvey's views regarding the circulation; he also examined the structure of the crystalline lens and of the brain. He is perhaps most generally known as the discoverer of the *Rotifers*, and as being the first to recognise the property which these animals possess of alternately dying and being resuscitated, according as they are dried or provided with the water necessary for the maintenance of their vitality.

His writings were collected and published in Dutch at Leyden and Delft in seven 4to volumes, the publication extending from 1686 to 1732. A Latin translation, under the title of *Opera Omnia, seu Arcana Naturæ*, was published at Leyden in 1792; and an English translation was published by Mr Samuel Hoole, in two 4to volumes, in 1798—1800.

LEEWARD ISLANDS. See **ANTILLES**.

LEEWAY. When a ship is steering in a direction AB, and a strong wind is blowing as indicated by the arrow, the ship's actual course is the resultant of two forces, one represented by her headway (or locomotive power), the other by the force urging her in the direction of the wind. This resultant must be somewhat in the line CD; and with the

same power of wind, the angle BED will be great or small as the headway is diminished or increased. This angle represents the leeway; and the amount

of ground lost to leeward in a given distance sailed is shewn by the side of the triangle subtending this angle. In all computations of the course pursued, allowance has to be made for leeway. Some ships, in tolerable weather, make scarcely any perceptible leeway, while bad sailers fall off as much as seven points of the compass.

LEFEBVRE, FRANÇOIS JOSEPH, Duke of Danzig and Marshal of France, was born at Ruffach, in Alsace, 25th October 1755. He entered the army at the age of eighteen, and was a sergeant in the French Guards when the Revolution broke out. On the dissolution of his regiment, he was transferred to another, and on two occasions had the opportunity of rendering important help to the royal family. There was always something gallant and humane in the valour of Lefebvre. He rose in rank with wonderful rapidity. He took part with Bonaparte in the *coup d'état* of the 18th Brumaire, and it was he who, at the head of his grenadiers, burst into the hall of the Council of Five Hundred, and rescued his fainting chief. In 1804, he was made a Marshal of the Empire. At the battle of Jena, he commanded the infantry of the Guards. He also conducted the siege of Danzig, and after its capture was created Duke of Danzig. He distinguished himself in the early part of the Peninsular War, but was recalled to Germany, where he was invested with the command of the Bavarian army, and suppressed the insurrection in the Tyrol. During the Russian campaign, he had the command of the Imperial Guard, and in 1814, of the left wing of the army which resisted the advance of the allies in France. Submitting to the Bourbons after Napoleon's abdication, he was made a peer. He died 14th September 1820.

LEFKOSIA, called also **NIKOSIA**, ancient **LEUCOSIA**, capital of the Turkish island of Cyprus (q. v.), is situated in a plain surrounded by mountains, about 35 miles inland from Famagusta Bay. It is surrounded by walls 3 miles in circumference, and contains several buildings of interest, as the cathedral, now the mosque of St Sophia, the church of St Nicholas, and the governor's palace. The kings of Cyprus of the Lusignan dynasty resided here. Calico-printing, tanning, and silk-weaving are the principal employments of the inhabitants. Pop. 15,000.

LEFORT, FRANÇOIS, son of Jacques Lefort, member of the Grand Council of Geneva, was born at Geneva in 1656. He was descended from an old Scotch family that had been settled there for a century, and members of which still exist at Geneva. After serving for some time in the French and Dutch service, he went to Russia, where he obtained a captain's commission in the army. He fought with distinction against the Turks and Tartars under the command of Romadnofski, and took an active part in the intrigues which placed Peter the Great on the throne. The czar never forgot L., who became his chief favourite, and, next to Peter, the most important personage in Russia. He was a man of great acuteness and ability. He remodelled the Russian army, and also laid the foundation of its navy; he sought also to encourage manufactures, and to promote the improvement of agriculture, and obtained for strangers a certain measure of toleration in matters of religion. In 1694, he was made Grand Admiral and Generalissimo of the Russian Army, and in 1697, governor of Novogorod. When Peter the Great undertook his visit to foreign countries in 1697, Lefort was the chief of the embassy, in the train of which the czar travelled *incognito*. L. died in 1699. Compare Voltaire's *Histoire de Pierre le Grand*, and Golikof's *Vie de Lefort*.

LEG, THE, comprises all that part of the lower extremity which lies between the knee and the ankle. It consists of two bones, the tibia and fibula (see **SKELETON** and **FOOT**), and of masses of muscles (together with nerves and vessels) which are held in their position by coverings of fascia, and are enveloped in the general integument.

The shaft of the tibia is of a triangular prismoid form, and presents three surfaces and three borders. The internal surface is smooth, convex, and broader above than below; except at its upper third, it lies directly under the skin, and may be readily traced by the hand. The external and the posterior surfaces are covered by numerous muscles. The muscular mass forming the calf (formed by the *gastrocnemius*, *soleus*, and *plantaris* muscles) is peculiar to man, and is directly connected with his erect attitude and his ordinary mode of progression. The anterior border of the tibia, the most prominent of the three, is popularly known as *the shin*, and may be traced down to the inner ankle.

The fibula, or small bone of the leg, lies on the outer surface of the tibia, and articulates with its upper and lower extremities, and with the astragalus inferiorly. It affords attachments to many of the muscles of this region.

This region is nourished by the anterior and posterior tibial arteries into which the popliteal artery separates. Both these arteries occasionally require to be tied by the surgeon in cases of wounds or aneurism. The blood is returned towards the heart by two sets of veins—the deep, which accompany the arteries, and the superficial, which are known as the internal or long saphenous, and the external or short saphenous veins. These superficial veins are very liable to become permanently dilated or varicose (a condition the nature and treatment of which are considered in the article **VARICOSE VEINS**), if there is any impediment to the free transmission of the blood, or even from the mere weight of the ascending column of blood, in persons whose occupation requires continuous standing.

The nerves of the leg, both sensory and motor, are derived from the great sciatic nerve and from its terminal branches, the internal popliteal and the external popliteal or peroneal nerve.

In cases of fracture or *broken leg*, the two bones are more frequently broken together than singly, and the most common situation is at the lower third. The tibia is more often broken by itself than the fibula, in consequence of its sustaining the whole weight of the body, while the fibula has nothing to support.

LEGACY is a bequest or gift contained in the will of a deceased person of a chattel or sum of money or other thing. In England, it is provided by statute that if a legacy is given to the witness of a will, or to his or her wife or husband, the legacy is void; therefore, a legatee should never act as a witness. So bequests to superstitious uses are void, as, for example, to maintain a priest, or an anniversary or obit, or a lamp in a church, or to say masses for the testator's soul, or to circulate pamphlets inculcating the pope's supremacy. Legacies of money for charitable purposes, as for the use of schools, churches, &c., are valid, but if the money is directed to be laid out in the purchase of land for such purposes, the legacy is void by what is called the Mortmain Act (q. v.), 9 Geo. II. c. 36. The policy of this statute has often of late been questioned, and it is enough to say that there is a mode, often practised, of evading it.

Legacies are divided into specific and general. A specific legacy means a legacy of a specific thing, as a particular horse, picture, silver-plate, &c., or a sum of stock in the funds. A general

legacy means a sum of money, without saying out of what fund it is to come, and it is payable out of the assets generally. The important difference between the two kinds of legacy is this, that if the subject-matter of the specific legacy fail, as if the horse die or be previously sold, &c., the legacy is gone, and no compensation is given for it; while, on the other hand, if there is not enough to pay all the general legacies, then they must abate—that is, share the loss—whereas the specific legacy, if it exist, must still be paid in full. There are various rules of great nicety and intricacy connected with the proper construction of legacies in a will, which are too technical to be noticed. It is a general rule applicable to all legacies, that they are only payable if there is money enough for the purpose, after paying all the testator's debts, for the maxim applies, that a man must be just before he is generous. The rule is, that a legacy is not payable by the executor till a year has elapsed after the testator's death, for it is presumed he requires this time to inquire into the state of the property; and this is true even though the testator has ordered the legacy to be paid within six months after the death. If a legacy is left to an infant under twenty-one, it cannot be paid to the father, or any other relation, without the sanction of the Court of Chancery. If a legacy is left to a married woman, the husband is entitled to claim it, unless it is left to her separate use, or unless she is unprovided for by the husband; in which case, the Court of Chancery will order the amount, if exceeding £200, to be settled upon her exclusively. Interest is due on legacies from the time when the principal sum is payable—i.e., one year after the death—unless otherwise specified. If the legatee die before the testator, the legacy lapses—that is, becomes void; but there are some exceptions, as where the legatee is a child or grandchild of the testator.—In Scotland, the rules as to legacies are mainly the same, but not entirely. The details are too technical to require notice here. See Paterson's *Compendium of English and Scotch Law*, p. 233. In Scotland, a legacy can be enforced in six months after the testator's death, and bears interest from such death. If a legacy is left to a married woman, the husband is now in general bound, as in England, to settle it on the wife, by the statute 24 and 25 Vict. c. 86.

In the United Kingdom, a legacy or succession duty is levied on the amount of all legacies (except to husband or wife). Children and issue, also parents and ancestors, pay one per cent. duty; brothers and sisters, and their issue, pay three per cent.; uncles and aunts, and their issue, pay five per cent.; granduncles, &c., and their issue, pay six per cent. Strangers in blood, and distant relatives, also illegitimate children, pay ten per cent.

LEGAL, or **LEGAL REVERSION**, in Scotch Law, means the right of redemption of an adjudication of heritable property, equivalent in England to equity of redemption of a tenant in *feif*.

LEGATE, the name of the ambassador or representative, whether temporary or permanent, sent by the pope to a particular church. In the ancient church, we meet many examples of officials, called in Greek *apocrisiarii*, and in Latin *responsales*, at the court of Constantinople; but their commission was commonly temporary, and granted for some special object. In the later constitution of the church, three classes of legates are distinguished: 1. *Legati a latere*, 'legates despatched from the side' of the pontiff, who are commonly cardinals; 2. *Legati missi*, called also 'apostolic nuncios,' and including a lower grade called 'internuncios;' 3. *Legati nati*, 'legates born,' whose office is not

personal, but is attached by ancient institution or usage to the see or other ecclesiastical dignity which they hold. Of the last class there were examples in most national churches; thus, the Bishop of Thessalonica was legate born for Illyricum, the Bishop of Arles for Gaul, the Bishop of Mainz for Germany, the Bishop of Toledo (though his claim was often disputed) for Spain, the Bishop of Canterbury for England, &c. This institution, however, has gone entirely into abeyance; and, indeed, the authority of legates is much modified in the modern church. In the mediæval times, the legate claimed full papal jurisdiction in the country assigned to him, even overruling the local jurisdiction of the bishops of the national church. This led to many disputes; to refusals to receive legates, as in France, where the legate was obliged to wait at Lyon till his credentials should have been examined and approved at court; and to counter legislation, as in England, to the statute of 16 Richard II., commonly known as the Statute of Premunire; and the Council of Trent removed the ground of contention by abolishing all such claims to local jurisdiction as trench upon the authority of the bishops. The legate, in the modern church, is little other than the ambassador, mainly for spiritual purposes, of the pope. He is held as belonging to the diplomatic body, and by the usage of Catholic courts enjoys precedence of all other ambassadors. The legates at the second-rate courts have the title of *internuncio*. Legates are commonly bishops or archbishops, in *partibus infidelium*. The establishment of a nunciature at Munich, in 1785, led to an animated controversy. In the pope's own states, as they existed before the late revolution, the governors of the Legations (see ITALY, PAPAL STATES) were called *legates*.

LEGATO (Ital. tied), in Music, means that the notes are to be played as if bound or tied together, or in such a manner that the one note is as if were rounded off, or flows into the following one. Many musicians think that legato passages should be played slower, which is a great mistake. Wherever *Legato* is marked, either as the character of the whole piece, or only over a part of the notes, it is the sign that the music requires to be performed in a flowing manner, and without any interruption between the striking of the notes.

LEGATUM REI ALIENÆ, in the Roman Law, is the legacy of a thing which does not belong to the testator. In England and Ireland, such a legacy is simply null and void; but in Scotland, the Roman law has been adopted, by which, if the testator knew the thing bequeathed was not his own, the executor is bound to purchase something else, as compensation to the legatee.

LEGEND (Lat. *legenda*, things to be read, lessons) was the name given in early times, in the Roman Catholic Church, to a book containing the daily lessons which were wont to be read as a part of divine service. Then the narratives of the lives of saints and martyrs, as well as the collections of such narratives, received this name, because the monks read from them at matins, and after dinner in the refectories. Such legends were also inserted in the breviaries (see **BREVIARY**), in order that they might be read on the festivals of the saints and martyrs. Among the mediæval collections of legends, that drawn up by the Genoese archbishop, Jacobus de Voragine, in the second half of the 13th c., under the title of *Legenda Aurea* (the Golden Legend), or *Historia Lombardica*, is the most celebrated. But the most comprehensive and valuable work on the subject is that commenced by the Bollandists (q.v.) in the 17th c.—*Acta Sanctorum*

(q. v.)—and still going on. The way in which a credulous love of the wonderful, exaggeration of fancy, and ecclesiastical enthusiasm, at times even pious fraud, mixed themselves up in these narratives with true history, caused stories of a religious or ecclesiastical nature generally to be designated as legends, in contradistinction from authentic ecclesiastical history; and thus the word 'legends' also serves to separate religious from secular traditions, and from those wild tales (Ger. *märchen*) that delighted the peasantry of medieval Europe. Legends in this sense of the word, as spiritual or ecclesiastical sagas, are found not only in the Roman Catholic, but also in the Greek Church, and their origin reaches back to the earliest ages of Christianity—Christ himself, the Virgin, John the Baptist, the apostles, and other prominent persons of the gospel history having become, at a very early period, the subject of them. But this tendency to mythic embellishment shewed itself more especially in regard to Mary, the later saints, martyrs, and holy men and women. From the ecclesiastical literature of the Eastern and Western Churches, especially of the latter, the legends also found an entrance into the national literature of Christian nations. Among the Germans, this was very markedly the case after the second half of the 12th c., although specimens of legendary poems are not altogether wanting at an earlier period. We may mention, for example, the *Kaiserchronik* (Imperial Chronicle), where the legendary element forms a very important part of the whole; and Werner's versified *Mariensleben* (Life of Mary), written in 1173, &c. The authors of these works were ecclesiastics; but already laymen, too, had appeared in the same field. The poetic versions of the legend of St Oswald and that of Pilate sprung from this class; and in the following age, when the medieval poetry of Germany was in its richest bloom, and the fosterers of the poetic art were emperors and princes, rather than ecclesiastics, the legend was employed by laymen on a grand scale, as the subject-matter of epic narratives. Thus, Hartmann von Aue (q. v.) worked up into a poem the religious legends about Gregory; Konrad von Fuesstrunnen, those concerning the 'childhood of Jesus'; Rudolf von Ems, those about 'Barlaam and Josephat' (q. v.); and Reinbot von Durne, those about 'St George.' Between the 14th and 16th centuries, legends in prose began also to appear, such as Hermann von Fritzlar's *Von der Heiligen Lebe* (written about 1343), and gradually supplanted the others. Finally, in the 16th c., when Protestantism began to powerfully influence the whole of German literature, the legend disappeared from German poetry, or passed over into the moral-didactic and also the comic narrative, in which form it was employed by Hans Sachs with the happiest effect. Numerous attempts have been made to resuscitate it in modern times. The first of the recent poets who clearly apprehended the poetic and spiritual elements of the old Christian legend was Herder (q. v.); and since his day, many German poets—for example, the 'Romantic School'—have endeavoured to give these a new embodiment.

LEGENBRE, ADRIEN MARIE, an eminent French mathematician, born at Paris in 1762. He obtained, in 1774, a professorship of mathematics in the Military School at Paris, and in 1783 was admitted a member of the Academy. In 1787, he was employed by the French government, along with Cassini and Mechain, in measuring a degree of latitude, and was chosen to perform the calculations after the work of observation had been finished. In 1806, he was appointed by the imperial government president for life of the university, and after the

second Restoration, an honorary member of the Commission for Public Education, and chief of the committee of Weights and Measures. But because in an election to a place in the Academy he did not vote for the ministerial candidate, he was deprived, in 1824, of his pension of 3000 francs. He died 9th January 1833. L. is the author of *Théorie des Nombres* and *Éléments de Géométrie*, and particularly distinguished himself by his investigation of the difficult subject of the attraction of the elliptic spheroid, and of a method for determining the paths of comets.

LEGER-LINES, in Music, the name of those short lines above or below the staff which are used to express those notes which extend beyond the five lines of the staff.

LEGHORN (*Livorno*), one of the chief Mediterranean seaports, is a city of Tuscany, in the modern province of Livorno, 50 miles west-south-west of Florence, and 14 miles south-south-west of Pisa; lat. 43° 32' 7" N., long. 10° 17' 7" E.; pop. 78,850, including about 8000 Jews, who possess a considerable portion of the commercial wealth of the place.

L. is one of the leading emporiums of trade in Italy, and enjoys the advantage of being a free port, to which circumstance it owes its extensive import-trade both with England and France: in no continental town are the manufactures of these countries to be found on a larger scale or at a more moderate cost. The average annual import and export trade of L. amounts to about £8,000,000, upwards of 10,000 vessels being employed for the transport of the various commodities of this traffic. The town is partly intersected with canals, by which merchandise is conveyed from the harbour to the numerous warehouses of the city. The port consists of an inner and outer harbour, the latter being sheltered by a mole, which projects into the sea upwards of half a mile, close to the great light-house. To secure increased shipping accommodation, a new harbour has been lately constructed for the reception of vessels of considerable tonnage. The roadstead, which is capacious, lies west-north-west of the harbour, and is protected by towers and a castle. On an island south of the harbour stands the lazaretto.

The population comprises natives of many climes (Greeks, Armenians, Turks, Moors, &c.), whose foreign appearance and striking garb give a picturesque appearance to the place. This concourse of strangers is further enlarged in the summer season by a great influx of native and foreign visitors, who resort to L. for its baths and mineral springs, the latter of which enjoy high medical repute. The town itself is chiefly of modern origin, and destitute of the grand historical associations and classical monuments which invest most Italian cities with their highest interest; its fine Mediterranean site, animated aspect, and great commercial life, are its principal attractions. The streets are regular and well paved, but narrow, and in consequence of being flanked by high houses, they are for the most part dark and gloomy. The churches are numerous. Many of the private dwellings of L. are tasteful and luxurious, and charming villas abound in the environs. The public institutions are well organised, and include three hospitals, an observatory, a poor-house, and a free library. The circuit of the town has been lately much extended by the demolition of old fortifications, and the extension of the barriers or city walls. The manufactures of L. are various and important; it possesses great factories of oil, tobacco, soap, salt, and the well-known liqueur *Rosolio*; its distilleries and dyeing works are also celebrated. Its chief exports are raw and

manufactured silks, straw-hats and straw-plaiting, oil, fruits, borax, cheese, anchovies, marble, sulphur, and coral. Its imports comprise colonial produce, raw and manufactured cotton, and wool, cutlery, hardware, metallic goods, earthenware, and salted fish.

Towards the end of the 13th c., L. was an unprotected village, which only assumed some importance on the destruction of the port of Pisa, and especially on its being assigned to Florence in 1421. Alessandro dei Medici constructed its citadel and fortified the town; Cosmo I. declared it a free port, and from that time dates the rise of its prosperity. In the 17th c., under Ferdinand I., it was a town of great commercial importance; and during the French imperial occupation of Italy, L. was proclaimed the chief town of the department of the Mediterranean. Since 1830, L. has taken a foremost part in the revolutionary life of Italy.

LEGION, in the Roman military system, corresponded in force and organisation to what in modern times we should call a *corps d'armée*. It differed in constitution at different periods of Roman history. In the time of the Republic, a legion comprised 4500 men, thus divided: 1200 *hastati*, or inexperienced troops; 1200 *principes*, or well-trained soldiers; 1200 *velites*, or skirmishers; 600 *triarii*, or *pilani*, veterans forming a reserve; and 300 *equites*, knights who acted as cavalry, and belonged to families of rank. During this period the legions were formed only for the season; standing armies being of later growth.

The *hastati*, *principes*, and *triarii* formed three separate lines, each divided into 10 *maniples* or companies, of 120 men each in the case of the two front lines, and of 60 men in the *triarii*. A *maniple* was commanded by a centurion or captain, who had a second-centurion, or lieutenant, and two sub-officers, or sergeants, under him: as non-commissioned officers, there was a *decanus*, or corporal, to every squad or tent of ten men. The senior centurion of each line commanded that line, and had therefore functions corresponding to a modern lieutenant-colonel. The *primipilus*, or senior centurion of the *triarii*, was the most important regimental officer, and commanded the legion in the absence of the tribunes. The 300 cavalry formed a regiment of ten *turmas*, or troops of 30 horsemen, each under three *decurions*, of whom the senior had the command. The *velites* were light troops, not forming part of the line of battle; had apparently no officers of their own; and were attached to the 30 *maniples* in equal proportions. The staff of the legion consisted of six tribunes, who managed the paying, quartering, provisioning, &c. of the troops, and who commanded the legion in turns for a period each of two months. This changing command, although inconvenient, lasted till the times of the civil wars, when a *legatus*, or lieutenant-general, was appointed as permanent commandant of the legion.

The offensive weapons of the *hastati* and *principes* were two barbed iron-headed javelins, one of which was hurled at the enemy on the first onslaught, while the other was retained as a defence against cavalry. The *triarii* had long pikes. In addition to these arms, every soldier bore a short, strong, cut-and-thrust, two-edged sword. The legionaries' defensive armour consisted of plumed helmet, breast-plate, iron-bound boot for the right leg, and a semi-cylindrical shield 4 feet long by 2½ broad. The *velites* had no defensive armour, were lightly armed, and in action usually operated for flanking purposes. Each *maniple* bore an ensign aloft, and each legion had its distinguishing eagle. Up to the time of Marius, service in a legion was sought as honourable occupation, and men of some means were alone eligible; but Marius enlisted slaves, and turned

the legions into corps of a purely mercenary army. At the same period, the manipular formation was abolished, the three lines were assimilated, and the legion was divided into 10 cohorts, each of 3 maniples. Soon the cohorts were raised to 600 men, making the legion 6000 infantry besides cavalry and *velites*. It was ranged in 2 lines of 5 cohorts each; but Caesar altered the formation to 3 lines, of respectively 4, 3, and 3 cohorts.

During the later Empire, the legion became complex and unmanageable; many sorts of arms being thrown together, and balistæ, catapults, and onagers added by way of artillery. Having so degenerated from its pristine simplicity and completeness, the legionary formation was soon overthrown amid the incursions of the victorious barbarians.

LEGION, THE THUNDERING (Lat. *Legio Fulminatrix*), a legion of the Roman army which is the subject of a well-known miraculous legend. During Marcus Aurelius's war with the Marcomanni (174 A.D.), his army, according to this narrative, being shut up in a mountainous defile, was reduced to great straits by want of water; when, a body of Christian soldiers having prayed to the God of the Christians, not only was rain sent seasonably to relieve their thirst, but this rain was turned upon the enemy in the shape of a fearful thunder-shower, under cover of which the Romans attacked and utterly routed them. The legion to which these soldiers belonged was thence, according to one of the narrators, called the Thundering Legion. This legend has been the subject of much controversy; and it is certain that the last told circumstance at least is false, as the name 'thundering legion' existed long before the date of this story. There would appear, nevertheless, to have been some foundation for the story, however it may have been embellished by the pious zeal of the Christians. The scene is represented on the column of Antoninus. The event is recorded by the pagan historian Dion Cassius (lxxi. 8), who attributes it to Egyptian sorcerers; and by Capitolinus and Themistius, the latter of whom ascribes it to the prayers of Aurelius himself. It is appealed to by the nearly contemporary Tertullian, in his *Apology* (c. 5), and is circumstantially related by Eusebius, by Jerome, and Orosius. It may not improbably be conjectured, supposing the substantial truth of the narrative, that the fact of one of the legions being called by the name 'Thundering' may have led to the localising of the story, and that it may have, in consequence, been ascribed to this particular legion, which was supposed to have received its name from the circumstance.

LEGION OF HONOUR, an order of merit instituted under the French Republic in 1802 by the First Consul, as a recompense for military and civil services. It was ostensibly founded for the protection of republican principles and the laws of equality, and for the abolition of differences of rank in society, every social grade being equally eligible; but its real aim doubtless was, by popularising the idea of personal distinction, to pave the way for the establishment of the Empire and of the more exclusive titles of nobility that were to accompany it. The proposal for its institution was at first violently opposed by the legislative body and the tribunate, on democratic grounds, and carried eventually by a narrow majority.

The order originally comprised three classes—Grand Officers, Commanders, and Legionaries. The class of Grand Officers was, on the coronation of Napoleon I., divided into Knights of the Grand Eagle (the highest class), and Grand Officers. On the restoration of the Bourbons, the Legion was

retained, but remodelled so as to lose much of its original character. The eagle was called a cross, and the effigy of Henry IV. replaced that of Napoleon. The Knights of the Grand Eagle became Grand Crosses, the Legionaries were transformed into Knights, and the numerous educational institutions, founded by Napoleon for the children and relatives of the members of the order, were much reduced in scale. In 1837, a new military class called Officers was admitted. Under the Presidency of Louis Napoleon, part of the property of Louis Philippe, which had been restored to the state, was set apart as an endowment for the Legion, and new regulations were made regarding the pensions of the different classes. The original form of decoration was reintroduced, which has under the second Empire been somewhat modified. As now worn, it consists of a cross of ten points of white enamel edged with gold; the points are connected with a wreath of laurel proper, and in the centre, within an azure circle charged with the words 'Napoléon III., Empereur des Français,' is a head of the emperor. The cross is ensigned by the imperial crown of France, and worn attached to a red ribbon. The Grand Officers also wear on the right breast a silver star charged with the imperial eagle. The same star is worn on the left breast by the Knights Grand Cross, and their cross is attached to a broad red ribbon which passes over the right shoulder.

The vast numbers of this order, and the insignificance of many of the persons on whom it has been conferred, have detracted much from its value. In 1843, the members numbered 49,417; but since 1851, only one new nomination has been made for every two extinct ones. The College of the Legion is in possession of considerable means, which have been augmented by the addition of property belonging to Louis Philippe. Out of this fund pensions are paid to certain members of the order, including knights and legionaries who have been wounded, or have undergone the amputation of a limb in service. These pensions have sometimes amounted to as large a sum as six million francs annually. By the existing statutes, candidates in time of peace must have served in some military or civil capacity for twenty years; exploits in the field or severe wounds constitute a claim in time of war. Two distributions take place in the year. The nomination of military persons takes place on parade, and of civil in the courts of justice. No ignoble punishment can be inflicted on a member of the order so long as he belongs to it. To rise to a superior rank, it is indispensable, at least for natives of France, to have passed through the inferior grades.

LEGITIM, or BAIRN'S PART, in the Scotch Law, is the legal provision which a child is entitled to out of the movable or personal estate of the deceased father. In Scotland, a father is not allowed to disinherit his children to a certain extent, the extent varying according as the wife survives or not. If a wife survive, and also children survive, the movable estate is divided into three equal parts. One is the widow's *Jus Relictæ* (q. v.), another is the children's legitim, the other third is the Dead's Part (q. v.), which the father may bequeath by will if he pleases, but if he make no will, then it goes to the children as next of kin. If the wife is dead, then half is legitim, and the other half is dead's part. Moreover, a father, though in his lifetime he may, without any check from his children, squander his property, still is not allowed on his death-bed to make gifts so as to lessen the fund which will supply legitim. The children's claim to legitim may be qualified by an antenuptial contract of marriage, which provides some other provision to the children in lieu of legitim; but, as a general rule,

the children's claim cannot be defeated by anything the father can do by means of a will or what is equivalent to a will. The legitim is claimable by all the children who survive the father, but not by the issue of those children who have predeceased. It is immaterial what the age of the child may be, and whether married or not. Children claiming legitim must, however, give credit for any provision or advance made by the father out of his movable estate in his lifetime. All the children, though of different marriages, share in the legitim. In England and Ireland, there is no similar right to legitim, for the father can bequeath all his property to strangers if he please; but a similar custom once existed in the city of London, and York, now abolished by 19 and 20 Vict. c. 94.

LEGITIMACY, PETITION TO DECLARE. In Scotland, it has always been competent for a party who wished to establish that he was a legitimate person, to raise an action of declarator of legitimacy, when the court solemnly decided the question. In England, this could not be done, except indirectly in the course of some suit for another purpose, until 1858, when the statute 21 and 22 Vict. c. 93 allowed all natural-born subjects whose legitimacy was doubted to present a petition to the Divorce Court to have the question decided.

LEGITIMATION, in Scotch (and Foreign) Law, is the rendering legitimate a person who was born illegitimate. This is done by the father subsequently marrying the mother of the child, and hence it is often called legitimization *per subsequens matrimonium*. This effect, however, can only be produced provided at the time of the birth the parents might have been married, or there was no obstacle to their then marrying, if so inclined, as, for example, if they were both unmarried, and there was no impediment. Sometimes it has happened that the father, A, or mother, B, after the child's birth, marries a third person, and has children, and after the dissolution of the marriage, A and B then marry. In this perplexing case, the courts have held that the intervening marriage with a third party does not prevent the bastard child, born before that event, from being legitimated by the subsequent marriage of A and B. But it has not been settled what are the mutual rights of the children of the two marriages in such circumstances, though it appears that the legitimate-born children cannot be displaced by the legitimated bastard. The doctrine of legitimization *per subsequens matrimonium* is not recognised in England or Ireland, having been solemnly repudiated by the famous statute of Merton, and the maxim prevails there, 'once a bastard, always a bastard.' Legitimation is also recognised in Scotland, but not in England or Ireland, where the parents were not really married, though they both *bonâ-fide* believed themselves to be married. This is called a putative marriage. The law of Scotland on these subjects follows the canon law, and the French law is the same.

LEGS, HUMAN, are not unfrequently borne as charges in Heraldry, sometimes naked, sometimes booted, and they may be couped, i. e., cut evenly off, or erased, cut with a jagged edge, and that either at the thigh or below the knee. The knee when represented is always embowed. A remarkable device of three legs in armour, conjoined at the thighs, and flexed in triangle, forms the insignia of the ancient kingdom of Man (see fig.), with the appropriate motto, *Quocunque jeceris*

stabilis. 'The classical symbol of the island of Sicily (Trinacria) was formed of three naked legs similarly conjoined, and the triple-mountained Isle of Man might have awakened in its Norman sovereigns some recollections of their Mediterranean conquests.'—*Planché*.

LEGUME (*Legumen*), in Botany, a fruit consisting of a single carpel, two-valved, and with the seeds—one or many—attached to the ventral suture only. It is commonly called a *pod*, and occurs in most of the species of the great natural order *Leguminosæ* (q. v.), of which the Bean and Pea are familiar examples. The legume generally opens when ripe, and then both by the dorsal and ventral suture; whereas the *follicle*, which nearly resembles it, opens by a suture along its face, and is one-valved. A few legumes do not open, but the sutures are present. Some are divided by transverse partitions (*diaphragms*); and the kind called a *lomentum* is contracted in the spaces betwixt the seeds, and separates into pieces instead of opening.

LEGUMINE, or **VEGETABLE CASEINE**. The seeds of most leguminous plants (pease, beans, lentils, &c.), and of the sweet and bitter almond, contain a proteine or albuminous body, which in all its essential properties corresponds with the caseine of milk. For example, it is precipitated from its solutions by rennet, acetic acid, alcohol, &c., and is not coagulated by boiling; while, as in the case of milk, the application of heat occasions the formation of a pellicle on the surface. The affinity of the two kinds of caseine is further shewn by the fact, that cheese is made by the Chinese from pease and beans.

In order to obtain legumina, pease, beans, or lentils are well soaked in hot water, and after being reduced to a pulp, are mixed with a considerable quantity of water. The starch, membranes, &c., soon sink to the bottom, and the legumine must be precipitated by acetic acid from the decanted or filtered fluid. Dry pease contain about one-fourth of their weight of legumine.

LEGUMINOSÆ (*Fabaceæ* of Lindley), a great natural order of exogenous plants, containing herbaceous plants, shrubs, and trees, many of them of the greatest magnitude. The leaves are alternate, usually compound, and have two stipules at the base of the leaf-stalk, which often soon fall off. The inflorescence is various. The calyx is inferior, 5-parted, toothed or cleft, the segments often unequal. The petals are 5, or, by abortion, fewer, inserted into the base of the calyx, usually unequal, often *Papilionaceous* (q. v.). The stamens are few or many, distinct or variously united. The ovary is 1-celled, generally of a single carpel; the style simple, proceeding from the upper margin, the stigma simple. The fruit is either a Legume (q. v.) or a Drupe (q. v.). The seeds are solitary or numerous, occasionally with an aril, often curved: the cotyledons very large.—There are three sub-orders: 1. *Papilionaceæ*, with papilionaceous flowers; 2. *Casalpiniæ*, with irregular flowers and spreading petals; 3. *Mimosææ*, with small regular flowers.—This natural order contains almost 7000 known species, of which about 5000 belong to the sub-order *Papilionaceæ*. They are spread over all parts of the world, from the equator to the poles, but their number is greatest in tropical and sub-tropical regions. They are applied to a great variety of purposes, and some of them are of great importance in domestic economy, the arts, medicine, &c. To this order belong the Bean, Pea, Kidney-bean, and all kinds of *pulse*; Clover, Liquorice, Broom, Laburnum, Lupine, Senna, and many other medicinal plants; Tamarind, Logwood, Indigo, and many others

which afford dyes, &c.; the *Acacias*, *Mimosææ*, &c. Many species are interesting on account of their beauty of form, foliage, or flowers. In the seeds of many is found a nitrogenous substance called *Legumine* (q. v.) or *Vegetable Caseine*.

LETA, an important trading town of India, in the Punjab, is situated in a fertile district on the left bank of the Indus, 60 miles south of Dera Ismael Khan. Lat. 31° N., long. 71° E. Besides being a mart for the sale of the produce of the surrounding district, it carries on an extensive transit-trade between the Punjab and the regions west of the Indus. Provisions, metals, grain, and cotton and wool, are the chief articles of sale. Pop. 15,000.

LEIBNITZ, GOTTFRIED WILHELM VON, perhaps the most extraordinary example of universal scholarship upon record, was born, July 6, 1646, at Leipzig, where his father was professor of law. He passed through the elementary studies at the 'Nicholas School' of his native city, under Thomasius; but he derived much more of the vast store of miscellaneous learning which his after-life exhibits from his private studies in a library to which he had access, and thus entered the university with peculiar advantages, in his 15th year, selecting the law as his profession, but devoting himself also to philosophy and literature. He spent some time at the university of Jena, and on his return, presented himself for the degree in law, for which he composed two essays of very remarkable merit. In consequence of his youth, however, he was refused the degree at Leipzig, and ultimately (in his 20th year), in 1666, graduated at Altdorf, where he was offered, but declined, a professorship; accepting in preference the post of secretary and tutor in the family of the Baron von Boineburg, to whom he rendered, from 1667 till 1672, a variety of literary and politico-literary services, and through whose recommendation he was appointed member of the judicial council in the service of the Archbishop-elect of Mainz. In 1672, he accompanied Boineburg's sons to Paris, and there submitted to Louis XIV. an essay entitled *Consilium Ægyptiacum*, containing a plan for the invasion of Egypt, which is by some supposed to have led to the Egyptian expedition of Bonaparte in 1798. In the course of this tour, which extended also to London, he formed the acquaintance of the most eminent philosophers of France and England, and among them of Newton. On the death of the Elector of Mainz, L. declining an appointment at Paris which would have necessitated his becoming a Catholic, entered the service of the Duke of Brunswick, and followed that prince, in 1676, as privy-councillor and librarian, to Hanover, where he permanently fixed his residence. His literary services to this court were of a very miscellaneous character. After a tour of historical exploration, he prepared a series of works illustrating the History of the House of Brunswick, seven volumes of which were published by himself, and two have been edited in our own time by Dr Perz, *Annales Imperii Occidentis Brunsvicensis* (1843—1845). He undertook likewise the scientific direction and organisation of the royal mines, into which he introduced many improvements; and he also, at the desire of the prince, took an active part in the negotiations for church union, and the theological discussions connected therewith, which formed the subject of a protracted correspondence with the celebrated Bossuet (q. v.) and with M. Pellisson, and led to the preparation, on his own part, of a very curious exposition of doctrinal belief (published from his MS. within this century, under the title *Systema Theologicum*), which, although written in the assumed character of a Catholic,

was intended to form a basis of negotiation. His private studies, however, were chiefly philosophical and philological. His correspondence on these subjects was most extensive, and he contributed largely to almost every literary and scientific journal of his day. He was the chief organiser of the Academy of Berlin, of which he was the first president, and originated both at Dresden and Vienna a project for the establishment of similar bodies. It was to him, likewise, that Peter the Great, who invited him to a meeting at Torgau, and bestowed on him a pension of 1000 rubles, with the title of privy-councillor, owed the plan of the since celebrated Academy of St Petersburg. On the accession of the Elector George to the crown of Great Britain, as George I., L. was disappointed in his expectation of accompanying the prince to his new court; nor did he long survive that event. His death, which was rather unexpected, occurred at Hanover, November 14, 1716. His biographers justly complain that his memory was treated with but little honour by his contemporaries; but a tardy stonement for their neglect has been recently offered by the erection of a public monument in his native city of Leipzig. The scholarship of L., as regards the vastness of its range, is probably unexampled. He was eminent in languages, history, divinity, philosophy, political studies, experimental science, mechanical science, and even belles-lettres. But it is chiefly through his philosophical reputation that he lives in history. It would be difficult to convey, in a popular sketch, a correct notion of his philosophical system, especially as he has nowhere himself methodised it. In the main, he may be described as a Cartesian, but he differed from Descartes both in his method and in some of his principles. The most important peculiarities of L.'s system may be reduced to four: his doctrine as to the Origin of Ideas, his theory of MONADS (q. v.), the 'Pre-established Harmony,' and the theory of OPTIMISM (q. v.). Of these, three will be found discussed under separate heads. The Pre-established Harmony requires a few words of explanation. The object of this singular conception was to explain the mysterious problem of the joint action of mind and body, or even in general the joint action of any two or more of the so-called 'monads,' since L. held that no two 'monads' could act upon each other. Descartes had resolved this problem by his theory of assistance, which attributed all action to the direct assistance of God. L., rejecting this hypothesis, supposed the mind and the body to be two distinct and independent machines, each having its own independent, though simultaneous action; but both so regulated by a harmony pre-established by God, that their mutual actions shall correspond with each other, and shall occur in exact and infallible unison. This harmony L. explained by the example of two time-pieces, one of which should be made to strike just as the other pointed to the hour. In the same way, just at the moment when the mind freely determines itself to a particular act, the body, by a harmony pre-arranged by God, will produce the particular action which is required to give efficacy to the volition of the mind. One of the most painful incidents in the literary and scientific history of L., was his controversy with Newton as to priority in the discovery of the method of the calculus. See CALCULUS, FLUXIONS. L. was the inventor of a calculating-machine, the working-model of which is still preserved at Göttingen. His works were first collected by Dutens, in 6 vols. 4to, Geneva; his philosophical works by Raspe, Amsterdam, 1767; and his letters at Lausanne and Geneva, 2 vols. 4to, 1745. But these collections are very imperfect, and large additions have been made of

late years, both in Germany and in France, especially by Dr Guhrauer, to whom we are also indebted for a biography. See Leibnitz, *Eine Biographie*, 2 vols. 8vo, Breslau, 1842.

LEICESTER, a town of England, municipal and parliamentary borough, and capital of the county of the same name, is situated on the right bank of the Soar, about 100 miles north-north-west of London. It contains numerous interesting churches, one of which, St Nicholas, is partly built of bricks from an ancient Roman building in the vicinity. Besides the ecclesiastical edifices, there are a number of important educational and benevolent institutions. Manufactures of boots and shoes, and of woollen and hosiery goods, lace-making, wool-combing and dyeing, are extensively carried on. L. is the centre of a famous agricultural and wool-raising district. There are about twelve fairs annually. The town of L. returns two members to parliament. Pop. (1861) 68,056.

L., known to the Romans as *Rata*, derives its present name either from Leire, the former name of the Soar, or from its having been a *Civitas Legionum*, a station or camp (*castra*) of the legions, which the Saxons would translate into Legeo-ceaster, corresponding to the British or Welsh Caer-leon. Under the Lancastrian princes, its castle, now almost entirely destroyed, was frequently a royal residence. The ruins of the abbey of St Mary Pré, or De Pratis, where Cardinal Wolsey died, still exist.

LEICESTER, ROBERT DUDLEY, EARL OF, born in 1531, was the son of John Dudley, Duke of Northumberland. His father was executed on account of the part which he took in the cause of Lady Jane Grey, and he was himself imprisoned on the same account. He was liberated in 1554; and in 1558, on the accession of Elizabeth, the dawn of his fortune began. He was made Master of the Horse, Knight of the Garter, a Privy-councillor, High Steward of the university of Cambridge, Baron Dudley, and Earl of Leicester. For these high honours, he seems to have been indebted solely to a handsome person and a courtly manner, for the course of his life shews him to have been possessed of not one single quality either of head or heart deserving of admiration. When young, he married Amy, daughter of Sir John Robsart. The general voice of the times has charged him with being accessory to her murder; and it is certain that she died suddenly, and very opportunely for his ambitious views, he being at that time a suitor for the hand of Elizabeth. Elizabeth gave out that she wished him to marry Mary of Scotland; but in this the English queen was acting with her usual insincerity. She encouraged L. openly as a suitor long after his arrogance had disgusted the nobles, and his profligacy had brought him into disrepute with the nation. His marriage to Lady Essex for a time excited the anger of his royal mistress, but she soon forgave him. In 1585, he went into the Low Countries at the head of a military force; but on this, as on two subsequent occasions, he shewed himself utterly unfitted for command. He died suddenly, on September 4, 1588. It was commonly said that he was poisoned by his wife, she having given him a potion which he had intended for her.

LEICESTERSHIRE, an inland county of England, lies immediately south of the counties of Derby and Nottingham. Area, 514,164 acres; pop. 237,412. The surface of the county is covered throughout by low hills. The district in the south-west, still called 'Charnwood Forest,' retains its name, although it is now almost destitute of wood. The 'Forest' is occupied by hills, which, though

inconsiderable in height, are rugged, distinct, and individual in outline. From the highest of them, Bardon Hill, 853 feet in height, an extensive view is obtained. Chief rivers, the Trent, which forms for a few miles the boundary of the county, and its affluent the Soar. The climate is mild, and the soil, which varies in fertility, is chiefly loamy. The richest tracts are kept in pasture, for which this county is famous. In all, upwards of 250,000 acres are in grass. Grazing, and sheep and cattle breeding, are carried on with great skill and success. An improved long-horn is the favourite breed of cattle. The 'Stilton' variety of cheese is for the most part made in this county. Coal-mines are worked, and granite, coarse slate, and freestone are quarried. The county returns four members to parliament.

LEIGH, a small but rapidly increasing manufacturing town in Lancashire, England, a station on the Bolton and Liverpool Railway, is situated 13 miles west of Manchester. Silks, cambrics, muslins, and fustians, are extensively manufactured; cotton-spinning and weaving are carried on; there is a large foundry, where agricultural implements are extensively made; and in the vicinity are productive coal-mines and flour-mills. Pop. (1851) 5206; (1861) 10,621.

LEIGHTON, ROBERT, Archbishop of Glasgow, was born in Edinburgh, or, as others think, in London, in the year 1611. He entered the university of the former city in 1627, took his degree of M.A. in 1631, and afterwards proceeded to France. Here he resided with some relatives at Douay, and formed the acquaintance of several Roman Catholic students, whose Christian virtues confirmed the natural charity of his spirit. L., indeed, could never have been a bigot. Gentle, tender, and pious from his earliest years, he shrunk from all violence and intolerance; but his intercourse with men whose opinions were so different from his own, convinced his reason of the folly and sinfulness of 'thinking too rigidly of doctrine.' Returning to Scotland, he was appointed, in 1641, to the parish of Newbattle, near Edinburgh; but he was not militant enough to please his fierce co-presbyters. They appeared to him, who had studied far more deeply than any Scotchman of his time the various ecclesiastical politics of Christendom, truculent about trifles. According to Bishop Burnet, 'he soon came to dislike their Covenant, particularly their imposing it, and their fury against all who differed from them. He found they were not capable of large thoughts; theirs were narrow as their tempers were sour; so he grew weary of mixing with them.' Yet we cannot altogether approve the facility with which he fraternised with the party that had inflicted such horrid cruelties on his excellent father, Dr Alexander Leighton, in 1630, for merely publishing a book in favour of Presbyterianism. In 1652, he resigned his charge, and in the following year was elected Principal of the university of Edinburgh, a dignity which he retained for ten years. Earnest, spiritual, and utterly free from all selfish ambition, he laboured without ceasing for the welfare of the students. After the restoration of Charles II., L., who had long separated himself from the Presbyterian party, was, after much reluctance, induced to accept a bishopric. He chose Dunblane, because it was small and poor. Unfortunately for his peace, the men with whom he was now allied were even more intolerant and unscrupulous than the Presbyterians. The despotic measures of Sharpe and Lauderdale sickened him. Twice he proceeded to London (in 1665 and 1669) to implore the king to adopt a milder course—on the former of these

occasions declaring 'that he could not concur in planting of the Christian religion itself in such a manner, much less a form of government.' Nothing was really done, though much was promised, and L. had to endure the misery of seeing an ecclesiastical system which he believed to be intrinsically the best, perverted to the worst of purposes, and himself the accomplice of the worst of men. In 1670, on the resignation of Dr Alexander Burnet, he was made Archbishop of Glasgow; an office which he accepted only on the condition, that he should be assisted in his attempts to carry out a liberal measure for 'the comprehension of the Presbyterians.' His efforts, however, were all in vain; the high-handed tyranny of his colleagues was renewed, and L. felt that he must resign, which he did in 1673. After a short residence in Edinburgh, he went to live with his sister at Broadhurst, in Sussex, where he spent the rest of his days in a retired manner, devoted chiefly to works of religion. He died June 25, 1684. L.'s best works (he published nothing during his lifetime) are to be found in an edition published at London (4 vols. 1825). All his writings are pervaded by a spirit at once lofty and evangelical. The truths of Christianity are set forth in the spirit of Plato. It was this that recommended them so much to Coleridge, whose *Aids to Reflection* are only commentaries on the teaching of the saintly archbishop.

LEIGHTON-BUZZARD, a market-town of England, Bedfordshire, is situated in a large agricultural district, 40 miles north-north-west of London. It has claims to considerable antiquity—its church was erected in the beginning of the 13th c., and in its market-place is an ancient and elegant pentangular cross. Many of the inhabitants are employed in making straw-plait. Pop. (1861) 4882.

LEININGEN, the name of one of the wealthiest of the mediæval Houses of Germany, was formerly applied to a German county in the district of Worms and Spire, with which, in the beginning of the 13th c., the county of Dachsburg became connected as part of the family possessions. The family is one of the oldest still existing in Germany. In 1779, the head of one of the branches into which it had become divided, the Count of Leiningen-Hardenburg-Dachsburg, was raised to the rank of a prince; but the peace of Lunéville deprived him of his ancient possessions—about 252 square miles in extent, on the left bank of the Rhine. He received, however, a compensation in other parts of Germany; and though no longer an independent prince, he retains his rank and wealth, his possessions being within the territories of Baden, Bavaria, and Hesse.

LEINSTER, one of the four provinces of Ireland, occupies the south-east portion of the country, and is bounded on the E. by St George's Channel and the Irish Sea. Area, 4,876,211 acres; pop. (1861) 1,439,596. At the period of the invasion by England (1170), this province formed two kingdoms, those of L. and Meath. Previously to the reign of Henry VIII., the province had been divided into the counties of Dublin, Meath, Louth, Kildare, Carlow, Kilkenny, and Wexford. The following counties were erected subsequently: Wicklow, formed from a portion of the county of Dublin; West Meath and Longford, from a part of Meath; and King's and Queen's Counties formed out of part of Kildare.

LEIPOA, a genus of gallinaceous birds, of the family *Megapodidae*, of which the only known species is *L. ocellata*, a native of Australia, inhabiting sandy and bushy plains. It is called L.,

LEIPOA—LEIPZIG.

or NATIVE PHRASANT, by the colonists. Like the Australian jungle-fowl, the L. constructs mounds of sand, or earth, and leaves, in which to lay its

Leipon (*Leipon scutellata*).

eggs. More than a dozen are often found in a nest. They are about three times as large as those of a common fowl; and are much esteemed as food. When pursued, it seeks to escape rather by running and hiding in the bush, than by the use of its wings. Few birds seem more likely to prove useful in domestication than the Leipon.

LEIPZIG (formerly *Lipsitz*, said to mean the home of the linden or lime trees, from the Slavic *Lip* or *Lipa*, a lime-tree), a city of the kingdom of Saxony, situated about 65 miles west-north-west of Dresden, near the Prussian border, in a large and fertile plain. The Elster, the Pleisse, and the Parthe flow through or past the city, and unite about 3 miles below it. The inner or ancient city was formerly surrounded by walls, which have now disappeared, but it is still separated from the far more extensive suburbs (*Friedrichs-stadt*, *Johannes-stadt*, &c.) by promenades planted with beautiful avenues of lime and chestnut trees. Many of the streets of the inner city are narrow and crooked; those of the more modern part (which contains also a number of fine squares) are wide and well built. The sanitary state of the city has been much promoted by an extensive and costly system of sewers. The inner city is the principal seat of business and merchandise. Pop. (1861) 78,485, of whom 1200 are Catholics, and 400 Jews; the rest are Protestants, mostly belonging to the Lutheran Church. Of the public buildings of L., few are in any way remarkable. The best is the Augusteum, the seat of the university, finished, according to designs by Schinkel, in 1836. The court has a splendid appearance. Of the three castles which formerly existed, only one remains, the Pleissenburg, now used for government offices and barracks; and, a portion of it, as a wool-store; the ditch has become a place for drill; and the tower, an observatory. L. is the seat of courts and public offices for a large district, as well as of those properly belonging to the city itself. It has many beautiful institutions, and also many educational institutions, including the university and two gymnasia. The university owes its origin to the removal of a large number of German students from Prague to L. in 1409, in consequence of disputes between the Bohemians and Germans. It opposed a strenuous resistance to the Reformation. It has always maintained a high reputation among the universities of Germany, and many distinguished

names are connected with it. Connected with the university are 60 professors, and 70 private teachers. The number of students is about 800. In the early part of the present century, the number amounted to about 1300. The University Library contains 150,000 volumes and 2000 manuscripts, and there are also in connection with the university a botanic garden, and a number of museums devoted to different departments of science. The City Library contains 80,000 volumes and 2000 manuscripts. There are a number of scientific associations, and various associations and institutions for the cultivation of the fine arts. In particular may be mentioned the conservatorium of music, which is reckoned one of the first in Europe. See CONSERVATOIRE.

The three annual fairs (held at Easter, Michaelmas, and the New Year, and lasting from three to five weeks) add much to the importance of L., and render it, with the exception of Hamburg, the greatest seat of trade in Germany. The origin of these fairs is traced back for more than 600 years. They are attended by Jews, Turks, Greeks, Armenians, Persians, and even (of late) by Chinese. The accession of Saxony to the German Customs Union, (*Zollverein*), and the opening of railways, have of late years produced a great increase of the concourse and of the business at these fairs, which had previously begun to decline. Transactions to the extent of 70,000,000 thalers (above £10,000,000 sterling) now take place at an Easter fair. The wool-market, which was instituted in 1836, and is held for three days in June, is much frequented.

L. is the principal seat of the bookselling and publishing trade in Germany, and indeed, in this respect, ranks third among the cities of the world, coming immediately after London and Paris. Upwards of 150 houses are engaged in the book-trade. There were also, in 1854, 35 printing establishments. Here the German booksellers have founded a common exchange, and annual settlements of accounts take place at the Easter Fair. One thousand houses are then represented by their commissioners at Leipzig. In consequence of this activity, L. has become the principal seat of type-founding in Germany. Among its other manufactures are pianofortes, scientific instruments, wax-cloths, oils, chemical products, perfumes, &c.

The city sprung up round a castle built by King Heinrich I., at the junction of the Pleisse and the Parthe. It is first mentioned as a town in 1015, and in the latter part of the 12th c., had from 5000 to 6000 inhabitants. It gradually increased in prosperity and importance. The famous *Leipzig Conference* between Luther, Eck, and Carlstadt, in 1519, greatly tended to the promotion of the Reformation. L. suffered greatly in the Thirty Years' War, in which it was five times besieged and taken, and again in the Seven Years' War; and although the commercial changes connected with the French Revolution at first affected it very favourably, yet it suffered not a little amidst the terrible struggles of the years 1812 and 1813, when it was alternately in possession of the French and of the allies.

The immediate neighbourhood of L. has been the scene of two battles of great importance in the history of Germany and of Europe—the battle of Leipzig, or of Breitenfeld (q. v.), on September 7, 1631; and the great battle of Leipzig—called the *Battle of Nations*, which continued for three days—from the 16th to the 18th of October 1813. The latter was one of the most bloody and decisive of those which effected the deliverance of Europe from French domination. The troops under Napoleon in this battle amounted to about 180,000 men, and those of the allies, commanded by Prince Schwarzenberg,

Marshal Blucher, and Bernadotte, Crown-prince of Sweden, to almost 300,000. About 2000 pieces of artillery were brought to the field. The loss of the French was reckoned at about 38,000 killed and wounded, and 30,000 prisoners; that of the allies to about 48,000. The victory of the allies was complete, and the French were compelled to evacuate L., and to retreat towards their own country.

LEITH, an important seaport, a municipal and parliamentary burgh of Scotland, on the southern shore of the Firth of Forth, at the mouth of the Water of Leith, two miles north of Edinburgh, with which it is now connected by a continuous line of houses. Although not without many fine edifices, the town, as a whole, is rather mean in appearance, being irregular and dingy, especially in the older and central parts. The Custom-house, Town-hall, Royal Exchange, and recently-erected Corn Exchange, are handsome buildings. West of the town, on the shore, is Leith Fort, an artillery station. L. is connected by branch-lines with the various railways centring in Edinburgh. The harbour extends, by means of two piers, upwards of a mile into the Firth, and has a depth of from 20 to 25 feet at high-water. There are already three wet-docks, containing an area of 15 acres; and two new docks of large dimensions are in contemplation. There are six graving-docks; one of them, recently finished, being 400 feet long by 80 feet broad (at coping), and 24 deep on sill at spring-tides. In 1862, 4761 vessels, of 930,670 tons, entered and cleared the port. The trade of L. is chiefly in colonial and foreign produce. Among the imports for 1862 were 481,530 qrs. wheat; 213,538 qrs. barley; 47,075 qrs. oats; 51,547 qrs. beans and pease; 11,746 qrs. Indian corn; 86,192 sacks and barrels of flour; 58,352 loads of timber; 14,604 tons of guano. Wine and tobacco are also extensively imported. The Customs Duties for 1861 amounted to £472,433. The chief manufactures are ships (in wood and iron), machinery, sailcloth, rope, ale, rectified spirits, soap, bottles, flour (for which there are extensive mills). Pop. 33,530. L. unites with Portobello and Musselburgh in sending a member to parliament.

LEITRIM, a county of the province of Connaught, in Ireland, which reaches the sea on the Bay of Donegal, but is encircled on its other sides by the counties of Donegal, Fermanagh, Cavan, Longford, Roscommon, and Sligo. Area, 613 square miles, or 392,363 acres, of which 249,350 are arable, and 23,784 are covered by water. The surface of L. is irregular. It is divided into two parts by a considerable lake called Lough Allen. The southern division is broken up by low narrow ridges, which enclose numerous small lakes, the chief of which is called Lough Rinn. The more level portion of this division of the county forms part of the great limestone plain of Ireland, and contains some excellent arable and pasture land. The northern division is much more irregular in surface, being intersected by several ridges of considerable elevation. To the north of Lough Allen the soil, except at rare intervals, is unfavourable for agriculture, and the climate is damp and ungenial. The principal crops are potatoes, oats, and hay; but, on the whole, the condition of the agriculture is very backward, the total number of acres under crops of all kinds having been, in 1861, 89,864, and in 1862, 86,467. L., however, is more a grazing than a tillage district. Large quantities of horned cattle are raised in the southern division. The total number of cattle in 1862 was 76,891; of sheep, 13,442. Turf is abundant in all parts of the county. The population in 1861 numbered 104,615, of whom 93,844

were Roman Catholics, 9516 Protestants of the Established Church, and the rest Protestants of other denominations. The number of children receiving education in the schools of the Board of National Education in 1861 was 14,969, of whom 13,716 were Roman Catholics. The river Shannon (q. v.) enters this county near its source in Cavan, and traversing Lough Allen, passes out at the southern extremity of Leitrim. Of other rivers, the Bonnet, the Yellow River, and the Daff, may be specially mentioned. The only towns of any note are Carrick-on-Shannon, Manor-Hamilton, and Mohill. The northern division of the county is more rich in minerals than most districts of Ireland. Coal is found in the Lough Allen basin, the chief working-beds being in the Slieve-an-Ierin Mountains, where coal is raised for smelting purposes. In the same district is found iron, the ore of the Arigna mines yielding as much as 58.2 per cent. of metal. Lead ore is also abundant, although the mining operations have been discontinued. The occupation of the people being chiefly agricultural, there are hardly any manufactures.

L. anciently formed part of the territory of Breifne O'Rourk. It was reduced to the English submission in the reign of Elizabeth, but revolted in 1588, submitting once more in 1603, when the O'Rourk accepted a patent of the residue of his estate. The confiscations which followed the great civil war may be said to have extinguished the native proprietary and the family of O'Rourk.

LELAND, JOHN, D.D., an English divine and apologist for Christianity, was born at Wigan, in Lancashire, in 1691, became a dissenting minister in Dublin in 1761, and first appeared as an author in 1733, by publishing a reply to Tindal's deistical work, *Christianity as Old as the Creation*. In 1737, appeared another apology, *The Divine Authority of the Old and New Testament asserted against the Unjust Aspersions and False Reasonings of a Book entitled 'The Moral Philosopher'*. As the learning displayed in these works was great, and the abilities considerable, the university of Aberdeen conferred on L. the degree of D.D. His best work is *A View of the Principal Deistical Writers that have appeared in England*. It once held a high position in Christian apologetic literature, and many people still regard it as a satisfactory demolition of deism. L. died in 1766. To his honour it should be added, that though his life was one of controversy, the spirit of fairness and charity never forsook him.

LELY, SIR PETER (PETER VANDER FAES), was the son of one Vander Faes, a captain of a regiment of infantry, who was generally called Le Capitaine du Lys, or Lely, from having been born at the Hague, in a house the front of which was decorated with a fleur-de-lis. L. was born at Soest, in Westphalia, in 1618. His father placed him in the school of Peter Grebber, a painter of talent at Haarlem, where he remained two years. He commenced his career as a painter of landscapes and subjects from history; but his talent induced him to devote himself exclusively to portrait-painting, and soon after the death of Van Dyck, he settled in London. He was employed successively by Charles I., Cromwell, and Charles II., who nominated him court-painter, and conferred on him the honour of knighthood. He had great facility of execution, and his style, though deficient in all the higher qualities of art, was well suited for his position as the favourite portrait-painter of such a court as that of his chief patron. There is a large collection of his portraits at Hampton Court, well known to the numerous visitors of

LEMAN—LEMON.

the public apartments there as the Beauties of the Court of Charles II. He died in London in 1680.

LE'MAN, LAKE. See GENEVA, LAKE OF

LE'MBERG (formerly *Löwenburg*, 'city of the lion'; i. e., of *Leo* Danielowicz, Prince of Halicz, who founded it in 1259; Polish name, 'Lwów'), the capital of the Austrian kingdom of Galicia and Lodomeria, is situated on a small stream called the Paltew, in a narrow basin among hills. Lat. 49° 50' N., long. 24° E. Pop. 68,000, of whom 24,000 are Jews. L. is the seat of a Roman Catholic, a Greek United, and an Armenian archbishop, and has 29 (it once had 50) churches. It is one of the finest towns in Austria, yet the houses are, for the most part, roofed with shingle. The synagogues in particular are very beautiful. The university (*Alma Franciscana*), founded in 1784, has 35 professors and 1000 students. The university library contains 40,000 volumes, 350 MSS., and a collection of coins amounting to 10,000. Here also is the seat of the institute founded by Ossolinaki, with a library of 60,000 volumes, and 1200 MSS., chiefly of Polish literature. The trade and manufactures of L. are of great importance. The town is now regularly fortified.

LEMMA (Gr. a thing assumed), a preparatory proposition introduced for the purpose of rendering the demonstration of a theorem or construction of a problem more perspicuous. The term is confined to the science of mathematics.

LEMMING (*Lemmus* or *Georgiculus*), a genus of rodent quadrupeds, of the family *Myridæ*, and subfamily *Arvicolide*, nearly allied to voles, but differing from them in the extreme shortness of the ears and tail, and in having larger and stronger claws, more adapted for digging. They are also more heavily formed. The most noted species is the Scandinavian L. (*L.* or *G. Norvegicus*), an animal of about

with 14 of alumina, and a little oxide of iron, soda, and water. It long had a great and undeserved reputation in medicine, and being sold in little pieces, each stamped with a particular stamp, it acquired the name of *Terra Sigillata* (Sealed Earth). The belief in its medicinal power is of very great antiquity. The stamp in ancient times, Galen says, was the head of Diana, the tutelary goddess of Lemnos; but is now only the Turkish name of the mineral. The ancients had more than one legend respecting the discovery of the virtues of Lemnian Earth.

LEMNOS (now commonly called *Stalimne*), an island in the northern part of the Grecian Archipelago, about 40 miles west of the entrance to the Dardanelles. It is irregular in shape, and is nearly divided into two islands, by two deep bays—Port Paradise on the north, and Port St Antony on the south. Area, 150 square miles. Pop. about 12,000. The women are famed for their beauty. It is hilly, rather bare of wood, and bears unmistakable traces of volcanic action at an early period, which fact probably originated the ancient myth of Vulcan lighting on this island when Jupiter hurled him from heaven. *Moschylos*, a volcano, no longer active, was believed to be the workshop and favourite residence of this deity. The principal product of L. is the *Lemnian Earth* (q. v.), used in ancient times as a cure for wounds and serpent-bites, and still highly valued by both Turks and Greeks. The chief town, *Kastro* (on the site of the ancient *Myrina*), has a population of 2000. It furnishes excellent sailors.

LEMON (*Citrus Limonum*), a tree which has by many botanists been regarded as a variety of the Citron (q. v.), and, like it, a native of the north of India. Its leaves are ovate or oblong, usually serrulate, pale green, with a winged stalk; the flowers are streaked and reddish on the outside; the fruit is oblong, wrinkled or furrowed, pale yellow, with generally concave oil-cysts in the rind. In the

Lemming (*Lemmus Norvegicus*).

five inches long, with variegated black and tawny fur, an inhabitant of the northern Scandinavian mountains, where it ordinarily feeds on reindeer-moss and other lichens, grass, catkins of birch, &c. But, breeding often in the course of a year, and producing four or five at a birth, it multiplies so much, that, periodically, vast troops leave their native regions, migrating either toward the Atlantic Ocean or the Gulf of Bothnia. Bears, wolves, foxes, lynxes, follow and prey upon them. Hawks and owls also attend, and contribute to the diminution of their numbers. It is said that those which survive, after spending a winter in the region to which they have migrated, seek to find their way back to their original abode. In times of prevalent superstition, lemmings were often exorcised by the priests, and the peasantry of Norway supposed them to fall from the clouds. The Laplanders eat the lemming.

LEMNIAN EARTH, a mineral found in the island of Lemnos; massive, chalk-like, soft, yellowish gray, or whitish, and falling to powder in water. It consists of about 66 per cent. silica,

Lemon (*Citrus Limonum*).

common variety, which is very extensively cultivated in many tropical and sub-tropical countries, the pulp of the fruit is very acid, abounding in citric acid. There is, however, a variety called the Sweet L., occasionally cultivated in the south of Europe, of which the juice is sweet. It is *Citrus Lumia* of some botanists, and has both concave and convex oil-cysts in the rind. The acid juice of the

LEMONADE-LEMUR.

common L. is much used in the preparation of the well-known cooling beverage called *Lemonade*, and is also administered in various forms in febrile and scorbutic complaints. It is much used by calico-printers to discharge colours, to produce greater clearness in the white part of patterns, dyed with dyes containing iron. As a preventive of sea-scurvy, it is an important article of sea-stores. Citric acid and lemon-juice are likewise made from it in great quantities. The rind of the fruit (*Lemon-peel*), separated from the pulp, and kept in a dried state, is a grateful stomachic, and is much used for flavouring. The produce of the lemon-groves of Italy, the Tyrol, Spain, Portugal, the south of France, and other countries bordering on the Mediterranean Sea, is largely exported to more northern regions. Sicily alone exports annually 30,000 chests, each containing 440 lemons. The L.-tree is very fruitful; it is more hardy than the orange, and in some parts of the south of England produces very good crops, being trained to a wall, and protected by a movable frame in winter.—The L. is supposed to have been introduced into Europe during the Crusades. It is almost naturalised in the south of Europe. It is so completely naturalised in some parts of the south of Brazil, that the flesh of the cattle which pasture in the woods acquires a strong smell of lemons, cattle being very fond of the fallen fruit.

LEMONADE is formed by adding two lemons sliced, and two ounces of white sugar, to a quart of boiling water, and digesting till cold. It is a useful drink for allaying thirst, and as a refrigerant in febrile and inflammatory complaints, and in hæmorrhage, in which cases it should be given iced.

LEMON-GRASS (*Andropogon achenanthus*), a beautiful perennial grass, three or four feet high, with panicle mostly leaning to one side, and spikelets in pairs, or, if terminal, in threes. It is a native of India, Arabia, &c., and is extremely abundant in many places. It has a strong lemon-like fragrance, oppressive where the grass abounds. It is too coarse to be eaten by cattle except when young, and is therefore often burned down. Europeans in India make an agreeable stomachic and tonic tea of the fresh leaves. By distillation, an essential oil is obtained (*Lemon-grass Oil*), which is employed externally as a stimulant in rheumatic affections, and is yellow, with a strong lemon-like smell. This oil is used in perfumery, and is often called *Oil of Verbena* by perfumers. L. has been introduced into the West Indies, Australia, &c. See also **GRASS OIL**.

LEMON-JUICE is a somewhat opaque, very sour liquid, obtained from lemons by expression and straining. Its acidity is due to the presence of citric and a little malic acid. Its principal uses in medicine are the following: 1. As an anti-scorbutic. —'Those only,' says Sir Gilbert Blane, 'who have made themselves acquainted with the early part of the naval history of this country, can duly appreciate the value of this simple remedy.' Its active principle, citric acid, is now frequently substituted for it. 2. In rheumatism.—Dr G. O. Rees, who first employed it in this disease, 'considers the citric acid to undergo changes in the stomach, and to supply oxygen to such elements as tend to produce uric acid, and thereby to induce the formation of urea and carbonic acid instead.' 3. In the formation of effervescent draughts.—A scruple of bicarbonate of potash in solution, mixed with about three drachms and a half of lemon-juice, so as to form a citrate of potash, forms an excellent effervescent draught; it acts as a mild diaphoretic and diuretic, tends to allay febrile disturbance, and serves to check nausea and vomiting. If the object is

specially to determine to the skin, a draught composed of a scruple of sesquicarbonate of ammonia in solution, with six drachms of lemon-juice, so as to form a citrate of ammonia, is preferable. Effervescent draughts are often employed as agreeable vehicles for the exhibition of other remedies.

LEMONS, OIL OF or **EMASCOR OF**, is extracted from the minute cells which are visible on the rind of the lemon, by submitting raspings of the fruit to pressure in hair sacs. It may also be obtained by distilling the peel with water; but its flavour, when obtained in this way, is less agreeable, although the oil itself is purer, owing to the absence of mucilaginous matter. The distilled oil is sold under the name of *scouring-drops*, for removing grease-spots from silks and other fabrics. Pure oil of lemons is mainly composed of a hydrocarbon, *citron or citronyl*, $C_{15}H_{22}$, which is consequently isometric with oil of turpentine, with which it is often adulterated. It is principally used for the purpose of communicating an agreeable odour to other medicines, although it is sometimes taken in the dose of two or three drops on sugar as a carminative. From its agreeable scent, it is often added to evaporating lotions and to ointments.

LEMONS, SALT OF, a name commonly but improperly applied by druggists to binxalate of potash mixed with a little of the quadroxalate. This mixture occurs in the *Oxalis acetosella*, and hence it has been designated *Salt of Sorrel*. It is employed in taking out ink-spots.

LEMPRIERE, JOHN, D.D., born in Jersey about 1760, was educated at Westminster School and Pembroke College, Oxford, and died February 1, 1824. His name was once well known to every classical student in the British empire, but the rising generation is forgetting it, and it will soon become *vix et præterea nihil*. L's *Classical Dictionary* (*Bibliotheca Classica*, 1786) was for many years the standard work of reference in England on all matters of ancient mythology, biography, and geography. To elderly scholars, the name will call up many pleasant memories of years long gone by; but the book itself ceased to possess any intrinsic value after the publication of the magnificent classical dictionaries edited by Dr William Smith, 1842–1853. Another work of L's was *Universal Biography* (Lond. 1806).

LEMUR, a genus of mammalia which gives its name to the family *Lemuridae*, a family allied to monkeys, and, like them, quadrumanous, having on each of the four extremities a well-developed thumb

Lemur.

opposed to the fingers, but in other respects exhibiting an approach to the ordinary quadrupedal type. The general form is slender and elongated, the muzzle pointed, the eyes large, the ears very small, the hind limbs longer and larger than the fore limbs.

The molar teeth are furnished with pointed tubercles fitting into each other, as in *Insectivora*, and the whole dentition of many of the family is adapted to animal rather than vegetable food. All the *Lemuridae* are natives of the warm parts of the old world, and live chiefly in forests, most of them climbing trees with all the agility of monkeys. The name *L.* (Lat. *lemur*, a ghost) is allusive to their rapid and peculiar noiseless movements. They are graceful and beautiful creatures, and generally gentle and easily tamed; but they have neither the prying and mischievous dispositions, nor the intelligence of monkeys. The species of the genus *L.*, as now restricted, are all natives of Madagascar. They are gregarious, and their food consists partly of fruits. The names *Maki* and *Macaco* are given to some of them, and sometimes extended to all. The largest species is about the size of a large cat.—To the *L.* family belong also the *Loris*, *Indris*, *Galagos*, and *Tarsiers*.

LEMURES, the general designation given by the Romans to all spirits of departed persons, of whom the good were honoured as *Lares* (q. v.), and the bad (*Larvæ*) were feared, as ghosts or spectres still are by the superstitious. Like the latter, they were said to wander about during the night, seeking for an opportunity of inflicting injury on the living. The festival called *Lemuria* was held on the 9th, 11th, and 13th of May, and was accompanied with ceremonies of washing hands, throwing black beans over the head, &c., and the pronunciation nine times of these words: 'Begone, you spectres of the house!' which deprived the *L.* of their power to harm. Ovid describes the *Lemuria* in the fifth book of his *Fæsti*.

LENA, an important river of Eastern Siberia, rises amid the mountains on the north-west shore of Lake Baikal, in the government of Irkutsk, flows first in a north-eastern direction to the town of Jakutsk, then north to the Arctic Ocean, into which it falls by several mouths. Its course is 3000 miles in length, and its chief affluents are the Vilni on the left, and the Vitim, the Olekma, and the Aldan on the right. Navigation on the *L.* is open from May till November. During spring, the waters of the river regularly overflow their banks. Near the town of Jakutsk, the breadth of the river is 64 miles. *L.* is the principal artery of the trade of Eastern Siberia. Russian and Chinese goods, as well as Siberian furs, furnished by the natives, are exported from this river. The chief harbours on the river are Olekminsk, Jakutsk, and Kachugak, where £50,000 worth of goods from Irkutsk are shipped annually.

LENCIŹA, an ancient Polish town, in the government of Warsaw, about 90 miles west-south-west of the city of that name. It contains the ruins of a castle of Kasimir II., erected in 1180. Pop. 5955, half of whom are Germans and Jews. Linen and woollen cloths and soap are manufactured.

LENKORAN, a Russian seaport on the Caspian Sea, and a district town in the government of Baku, in the Caucasus, in lat. 38° 46', is a place of great importance for the trade between Russia and Persia; but a defective harbour, and the vicinity of warlike tribes, have hitherto rendered its natural advantages of little avail. Pop. 5644.

LENNÉP, JAN DANIEL VAN, a Dutch philologist, was born at Leeuwarden, in the province of Friesland, in 1724, and studied at Franeker and Leyden. In 1753, he was appointed Professor of Ancient Languages at Groningen, and fifteen years afterwards at Franeker. He died in 1771. The works which principally obtained him a reputation for learning and acuteness, are his *Etymologicum Linguae Græcæ*, and his *De Analogiâ Linguae Græcæ*, both of which

were posthumously published. The progress of etymological science, however, has rendered them useless.—DAVID JACOB VAN LENNÉP, a member of the same family as the preceding, was born at Amsterdam, 15th July 1774, devoted himself to the study of philology, and ultimately became Professor of Rhetoric at Leyden. He died 10th February 1853. Besides being one of the best Latinists among his countrymen, he wrote several exquisite pieces of poetry in his mother-tongue. His principal writings are *Carmina Juvenilia* (Amst. 1791), *Exercitationes Juris* (Leyd. 1796), valuable annotated editions of some of the classic authors, and a metrical Dutch translation of the *Works and Days* of Hesiod (Amst. 1823).—His son, JACOB VAN LENNÉP, born at Amsterdam, 25th March 1802, is proudly called by his countrymen, the 'Walter Scott of Holland.' Educated for the law, he passed as a barrister, and soon achieved a great reputation for legal knowledge. Yet without neglecting his extensive practice, he has for more than thirty years cultivated literature with untiring assiduity, and, considering the drudgery of his professional work, with astonishing success. *L.* first appeared as an author shortly before 1830, in a work entitled *Vaderlandsche Legendes* (National Legends). Since then, his most popular works have been the comedies, *Het Dorp aan die Grenzen* (The Frontier Village, 1830), *Het Dorp over die Grenzen* (The Village over the Frontier, 1830), and the novels, *Onze Voorouders* (Our Forefathers), *De Roos van Dekama* (The Rose of Dekama, 1837—English by Woodley, 1847), and *De Pleegzoon* (The Adopted Son—English by Hoskins, New York, 1847). *L.*, who possesses a remarkable knowledge of the English language and literature, has translated into Dutch some of Shakspeare's finest plays, and of Byron, Southey, and Tennyson's poems. A complete edition of his dramatic works, comprising tragedies, comedies, and operas, appeared at Amsterdam in 1852—1855. He has been engaged for several years on an edition of the great Dutch poet Vondel.

LENNOXTOWN, a village of Stirlingshire, Scotland, is situated in a picturesque district on Glazert Water, at the terminus of the Campsie Railway, eleven miles north-north-east of Glasgow. It contains (1861) 3184 inhabitants, employed chiefly in the print-works and alum-works in the immediate neighbourhood.

LENOCINIUM is a term borrowed from the canon law, and used in English, but more frequently in Scotch law to denote a husband's connivance in his wife's adultery. The wife can set up such defence to a suit for divorce, on the ground of her adultery so procured.

LENS (Lat. 'a lentil') is a thin circular section of any transparent substance, adapted to magni-

Fig. 1.—Lenses.

1, double-convex; if the surfaces are of equal curvature, equi-convex; 2, plano-convex; 3, convexo-plane; 4, double-concave, or concavo-concave; 5, plano-concave; 6, concavo-plane; 7, convex-meniscus; 8, concave-meniscus; 9, convexo-concave; 10, concavo-convex. The arrow shows the direction in which the light is supposed to fall upon the lenses.

fying purposes by having its two surfaces either both spherical, or one of them plane and the other spherical. The above figure represents, in

transverse section through their centres, the different forms of lenses. All these separate forms are arranged into two classes, those which are thickest, and those which are thinnest, in the centre, the first being generally denominated *convex*, and the second *concave* lenses. The effect produced by lenses upon rays of light passing through them, is, as in prisms, to bend the rays towards the thickest part of the lens; so that when a pencil of parallel rays passes through a convex lens, the emergent rays are *Convergent* (q. v.), while, if a concave lens be used, they are *Divergent* (q. v.), and the point to which the rays converge, or from which they diverge, approaches nearer to the lens as its curvature increases. This point is called the principal focus, and is real, i. e., the rays actually pass through it, for a convex lens; but virtual or imaginary, for one that is concave. As a simple illustration of the mode in which this point is determined, we shall take the case of parallel rays falling directly upon a double convex lens (fig. 2). Here, O is the centre of the curved surface PAP', and O' of the surface PBP'; q is the point towards which the rays tend while passing through the lens, and F the point to which they converge after emergence. Let OA = r, O'B = s, Aq = f', and BF (the focal length) = f; then, if

Fig. 2.

the thickness of the lens is so small as to be neglected, which may always be done when the curvature of the lens is small, Aq = Bq, and AF = BF. By the demonstration given under the article

DIOPTRICS, we find $f' = \frac{\mu}{\mu - 1} r$, for the refraction at the first surface; and, for the second surface, we find, in the ordinary treatises on Optics, that when a pencil of converging rays emerges from a lens, $\frac{\mu}{f} = \frac{\mu - 1}{s} - \frac{1}{f'}$. Adding this formula to the

former, we obtain $0 = (\mu - 1) \left(\frac{1}{r} + \frac{1}{s} \right) - \frac{1}{f}$ or $\frac{1}{f}$

$= (\mu - 1) \left\{ \frac{1}{r} + \frac{1}{s} \right\}$; and if the lens be equi-convex

($r = s$), and of glass ($\mu = \frac{3}{2}$), we have $\frac{1}{f} = \frac{1}{r}$ or $f = r$.

This result is equally correct for a double concave lens; but if the thickness of the lens be taken into account, there is a small quantity which is additive to the value of $\frac{1}{f}$ in the convex, but subtractive in the concave lens. The determination of the principal focus in the other and less common forms of lenses, will be found in any of the ordinary text-books. All the lenses figured in fig. 1, though they may be of the same focal length, have peculiar properties which render them suitable for particular optical instruments; thus, the convexo-plane lens has only one-fourth of the aberration of a plano-convex, or two-thirds of an equi-convex or equi-concave of the same focal length—but, in general, the equi-convex is the most desirable form of lens. This aberration* has been to opticians what refraction

is to the astronomer, an unwelcome intruder, which spoils his finest theories, and sets a limit to the accuracy of his results. But, in the case of lenses, the aberration has been destroyed by combining lenses of equal and opposite aberrations, as, for instance, uniting, by means of Canada balsam, a double convex with a double concave. A still better method would be the formation of lenses having one side spherical, and the other of an ellipsoidal or a hyperboloidal form; this, however, has not yet been successfully accomplished.

LENT (Ang.-Sax. *lencden* = Ger. *lenz*, spring; Gr. *Tessaracoste*; Lat. *Quadragesima*), the fasting-time before Easter, which is observed in the Roman, and in the Greek, and other Oriental churches. Under the head of *FAST* have been considered the doctrinal and historical questions connected with the general practice of fasting. It remains only to explain briefly what is peculiar in the institution and the observance of the Lenten fast. It is certainly of very ancient, if it be not even of primitive institution. The earliest allusions to it speak of it as an established usage handed down from the Fathers. The forty days' period, as commemorative of our Lord's forty days' fast, or of the similar perfunctory fasts of Moses and of Elias, commences with Ash-Wednesday, between which day and Easter-Sunday (omitting the Sundays on which the fast is not observed), forty clear days intervene. The rigour of the ancient observance, which excluded all flesh, and even the so-called 'white meats,' is now much relaxed; but the principle of permitting but one meal, with a slight refection or collation, is everywhere retained. In Spain, during the Crusades and the wars with the Moors, a practice arose of permitting, in certain cases, the substitution of a contribution to the holy war for the observance of the Lenten abstinence; and although the object has long since ceased, the composition is still permitted, under the same title of the *Cruzada*. In the Greek Church, the ante-paschal fast is of 48 days; but it is only one of four similar fasting periods observed in that church. See *FAST*. In the Anglican Church, Lent is retained as a church season of the calendar, with special services, and proper collects and prayers; but the observance of the fast is left to the discretion of each individual.

LENTANDO, in Music, the same as *rallentando* or *ritardando*, meaning a gradual decrease in the speed of the movement.

LENTIBULARIAEÆ, a natural order of exogenous plants, allied to *Primulaceæ*, but distinguished by an irregular corolla, and diandrous flowers. It has also intimate relations with *Scrophulariaceæ*. It contains nearly 200 known species, all herbaceous, and all living in water or marshes. They abound chiefly in the tropics. A few species of Bladderwort (q. v.) and Butterwort (q. v.) are its only representatives in Britain.

LENTIL (*Ervum lens*), an annual plant of the same genus with Tares (q. v.), a native of the countries near the Mediterranean, and which has been cultivated from the earliest times, yielding an esteemed kind of pulse. The English translation of the Bible is probably correct in calling the *red pottage* with which Jacob purchased Esau's birth-right, *pottage of lentils*; the red colour being very characteristic of this, which is still a very common article of food in the East. The L. is extensively cultivated in the south of Europe, Egypt, and the East, and to some extent in other parts of the world. It has a weak and branching stem, from 6—18 inches high, and pinnate leaves with 6—8 pair of

* The directions which have been given for finding the foci of lenses, apply only to rays which pass through and near the centre of the lens; the rays which pass near the edges converge to a different focus, and the distance between these two foci is called the longitudinal aberration.

leaflets, the upper leaves only running into tendrils. The flowers are small, white, lilac, or pale blue, the corolla much concealed by the calyx, which is divided almost to its base into five narrow teeth. The pods are very short and blunt, thin, two-seeded, and smooth; the seeds have the form of a round lens, convex on both sides. There are numerous

Lentil.

varieties, having white, brown, and black seeds, which also differ considerably in size, the greatest diameter of the largest being about equal to that of moderate-sized pease. Lentils are a very nutritive food, containing an uncommonly large amount of nitrogenous substances, and more easily digested than pease. They have recently become common in the shops of Britain in a form resembling *split pease*, and in that of meal (*L. farina*), which is the basis, if not the whole substance, of *Revalenta Arabica* and *Ervalenta*, so much advertised as food for dyspeptic patients, at prices greatly exceeding those for which *L.* meal can be obtained under its own name. Lentils mixed with pease in the making of pea-soup, greatly diminish its tendency to produce flatulence. Lentils are also excellent food for horses; and the herbage used as green food for cows, renders them extremely productive of milk. The *L.* grows best in a light and rather dry soil. In a very rich soil, it produces comparatively few pods. Some of the varieties succeed well even on very poor soils. The whole life of the plant is shorter than that of any other of the *Leguminosae* cultivated in Britain. The seed may be sown in April in the climate of Britain; but although there is nothing in the coldness of the climate to prevent the successful cultivation of lentils, it seems to be too moist for them, the ripe or ripening seeds being very apt to be injured by moisture. There is no evident reason, however, why this plant should not be cultivated for green food of cattle.

LENTINI, a town of Sicily, in the province of Syracuse, stands near the lake of the same name, on a hill 15 miles south-south-west of Catania, and has about 5000 inhabitants. It has a large gunpowder mill, and derives a good revenue from the fishery in Lake Lentini.

LENTO, or LENTAMENTE, in Music, means

slow, gentle. According to the best authorities, the movement implied by *Lento* is quicker than *Adagio*, or between it and *Andante*.

LEO, the fifth sign of the ZODIAC (q. v.).

LEO, the name of twelve among the popes of the Roman Catholic Church, of whom the following call for particular notice.—LEO I., surnamed 'the Great,' who is held a saint of the Roman Catholic Church, and is one of the most eminent of the Latin Fathers, was born of a distinguished Etrurian family at Rome about the end of the 4th century. Of his early life, little is known. On the death of Sixtus III. in 440, *L.* was chosen as his successor. It is in his pontificate that the regular series of papal letters and decretals may be said to commence. Leo's letters, addressed to all parts of the church, exhibit prodigious activity and zeal, and are used by Roman controversialists as an evidence of the extent of the jurisdiction of the Roman see. In a council held at Rome in 449, he set aside the proceedings of the council of Ephesus, which had pronounced in favour of Eutyches (q. v.), summoned a new council at Chalcedon, in which his legates presided, and in which Leo's celebrated 'Dogmatical Letter' was accepted 'as the voice of Peter,' and adopted as the authentic exposition of the orthodox doctrine on the person of Christ. The history of Leo's interposition with Attila in defence of the Roman city and people will be found under the head ATTILA; and his subsequent similar interposition with Genseric, if less dramatic in the incidents with which history or legend has invested it, was at least so far successful as to save the lives of the citizens, and the public and private buildings of the city of Rome. Leo died at Rome in 461. His works, the most important of which are his Letters and Sermons, were first printed in 1479, and afterwards by Quessel (2 vols. Paris, 1676); but a much more complete and trustworthy edition is that of Cacciari (3 vols. fol. Rome, 1753—1755), and of the Brothers Ballerini (Venice, 1757).—The pontificate of LEO III. is chiefly noticeable as the epoch of the formal establishment of the Empire of the West. He was a native of Rome, and was elected pope on the death of Adrian I. in 795. During the greater part of the 8th c., the popes, through the practical withdrawal of the eastern emperors, had exercised a temporal supremacy in Rome, which was fully recognised by the gift of Pepin, and placed under the protectorate of the Frank sovereigns, who received the title of Patrician. The pontificate of Leo, however, was a troubled one, and in 799 he was treated with much violence, and obliged to flee to Spoleto, whence he afterwards repaired to Paderborn, in order to hold a conference with Charlemagne. On his return to Rome, he was received with much honour by the Romans, and the chiefs of the conspiracy against him were sentenced to banishment. In the following year (800), Charlemagne, having come to Rome, was solemnly crowned and saluted emperor by the pope, and the temporal sovereignty of the pope over the Roman city and state, under, however, the suzerainty of the emperor, was formally established. In 804, Leo visited Charlemagne at his court at Aix-la-Chapelle. With Charlemagne's successor, Louis le Débonnaire, Leo was embroiled in a dispute about the right of sovereign jurisdiction in Rome, which had not been brought to a conclusion when Leo died in 816.—LEO X., Giovanni de' Medici, the second son of the celebrated Lorenzo de' Medici, was born at Florence in December 1475. From his cradle, he was destined to the ecclesiastical career. His education was intrusted to the ablest scholars of the age; and through the influence of his father with the pope, Innocent VIII., he was

created cardinal at the unprecedented age of thirteen years, in 1488. In the expulsion of the Medici from Florence, after the death of Lorenzo, the young cardinal was included, and he used the occasion as an opportunity of foreign travel. He was employed as legate by Julius II.; and during the war with the French, he was taken prisoner in the battle of Ravenna, but soon afterwards effected his escape. On the death of Julius II. in 1513, Cardinal de' Medici was chosen pope at the early age of 37, under the name of Leo X. His first appointment of the two great scholars Bembo and Sadoleto as his secretaries was a pledge of the favour towards learning which was the characteristic of his pontificate; but he did not neglect the more material interests of the church and the Roman see. He brought to a successful conclusion the fifth council of the Lateran (see COUNCIL), and the schism which was threatened by the rival council of Pisa. He concluded a concordat with Francis I. of France, which continued to regulate the French church till the Revolution. In the political relations of the Roman see, he consolidated and, in some degree, extended the re-conquests of his warlike predecessor, Julius II., although he also used his position and his influence for the aggrandisement of his family. His desertion of the alliance of Francis I. for that of his young rival, Charles V., although the subject of much criticism, was dictated by a sound consideration of the interests of Italy. But it is most of all as a patron of learning and art that the reputation of Leo has lived with posterity. Himself a scholar, he loved learning for its own sake; and his court was the meeting-point of all the scholars of Italy and the world. He founded a Greek college in Rome, and established a Greek press, which he endowed munificently (see LASCARIS). In the encouragement of art, he was no less munificent. Painting, sculpture, architecture, were equally favoured; and it is to his vast project for the rebuilding of St Peter's, and to the step to which he had recourse for procuring the necessary funds—his permitting the preaching of an indulgence, one of the conditions of obtaining which was the contribution to this work—that the first rise of the Reformation in Germany is ascribed. He himself seems to have regarded the movement as of little importance, describing it as 'a squabble among the friars;' and though he condemned the propositions of Luther, and issued a commission to inquire into his doctrines, his measures, on the whole, were not marked by much severity. His personal habits were in keeping with his taste—splendid and munificent in the highest degree; but in his moral conduct he maintained a strict propriety, and his character, although not free from the stain of nepotism, the vice of that age, and more modelled on the ideal of an enlightened prince than on that of a zealous and ascetic churchman, was beyond all imputation of unworthiness or irregularity. His death, which occurred rather suddenly during the public rejoicings in Rome for the taking of Milan, was by some ascribed to poison; but there seems no solid reason for the suspicion. It took place December 1, 1521, in the 46th year of his age. See Roscoe's *Life and Pontificate of Leo X.* (4 vols. Liverpool, 1805; Italian by Bossi, 12 vols. Milan, 1818).

LEO III., FLAVIUS, surnamed 'the Issaurian' (from his birthplace), Emperor of Constantinople (718–741 A.D.), was, like most of the eastern emperors, first a soldier in the imperial army, and soon rose to eminence through his military talents. Anastasius II. appointed him to guard the Asiatic portion of the empire from the ravages of the Arabs, who were headed by the celebrated Moslema; but on

the deposition of the former by Theodosius III., Leo, outwitting his Arab opponent, marched against the usurper, whom he compelled to resign his crown, which he himself assumed (March 718). Leo was scarcely seated on the imperial throne, when the Calif Suleiman laid siege to Constantinople by land and sea; this, the third siege of the capital by the Arabs, lasted for two years, but was finally raised through the energy of Leo. The governors of several provinces had meantime rebelled, and it cost Leo several years of petty warfare before peace was restored to the empire. The opportunity having at length arrived for which he had long watched, Leo issued an edict condemning the worship of images in the Catholic churches throughout the empire. In this he seems to have been actuated by a double motive—the restoration of purity of worship in the Catholic churches, and the removal of a grievous eyecore to many of his subjects, Christian, Mohammedan, Jewish, and Oriental. The edict produced a most startling effect; rebellions broke out in all quarters, and Ravenna, Rome, and the other Greek possessions in Italy were finally severed from the empire. Leo, enraged at his losses, determined to take revenge on their author, the pope, and accordingly removed Greece, Illyria, and Macedonia from his spiritual jurisdiction, subjecting them to the Patriarch of Constantinople, thus creating a permanent breach between the Latin and Greek churches (734). During the remainder of his reign, little of importance occurred, excepting an indecisive war with the Arabs, and a great earthquake (October 740), which caused dreadful calamities throughout the empire. Many of the principal buildings and monuments in Constantinople were thrown down; the towns of Nicomedia, Pnenetis, and Nicæa in Bithynia, were completely destroyed, and in Egypt several towns disappeared with all their inhabitants. Leo died 18th June 741.

LEOBSCHÜTZ, a town of Prussia, capital of the circle of the same name, near the river Zinna, 32 miles south of Oppeln, has large corn and flax markets, and manufactures of various kinds. Pop. 7890.

LEOMINSTER, a market-town, and municipal and parliamentary borough of England, in the county of Hereford, situated 12 miles north of the city of that name, on the river Lug. It returns two members to parliament. The immediate vicinity of L. is the most celebrated cattle-breeding district in the world—all the prize 'Herefords' at the shows being bred and fed here. Pop. (1861) 5658.

LEON, the name of a city and of a lake, called also Managua, in Nicaragua, in lat. 12° 25' N., and long. 86° 57' W. It stands near the north-west extremity of the lake of its own name, distant about 10 miles from the Pacific Ocean, is finely situated in a most picturesque district, and contains a cathedral, a noble edifice, and a university. From the top of the cathedral a beautiful and extensive view, embracing 13 volcanoes, may be obtained. Pop. about 35,000.—The lake measures 35 miles by 15. It derives considerable importance from its being an essential part of perhaps the most promising route across Central America between the Atlantic and the Pacific. Between it and the former ocean lies the still larger Lake of Nicaragua, into which it empties itself, with a fall of only 28 feet.

LEON (the *Legio septima gemina* of the Romans), capital of the former Spanish province of the same name, is situated between the rivers Bernesga and Torio, in a beautifully wooded plain, 85 miles north-west of Valladolid. Part of the old Roman

wall, 20 feet thick, is still standing. The streets are crooked and dirty, but the churches are both numerous and splendid, especially the cathedral, a specimen of the purest Gothic, containing the tombs of many sovereigns of L., saints, and martyrs. The trade of L. is now unimportant. Pop. 9603.

LEON, formerly a kingdom, and subsequently a province of Spain, now subdivided into the smaller provinces of Salamanca, Zamora, and Leon, is situated in the north-west of Spain, south of Asturias, and bordering on Portugal. Area about 15,000 square miles. Pop. 861,434. The country, which is intersected by the Douro, is mountainous, generally fertile, but miserably cultivated. It affords pasturage to vast flocks of merino sheep. The inhabitants are for the most part uneducated and lazy, but are very high-spirited, rich in peculiar customs, of pure Spanish descent, sincere, hospitable, and brave. It is said that in the high districts south of Salamanca, remnants of the pure Gothic tribes exist, and at Astorga, remnants of the old Celtiberi—the *Maragatos*. The means of communication are everywhere very defective. The Kingdom of Leon was erected, in 746, by Alfonso the Catholic out of the provinces he had wrested from the Saracens, and the older kingdom of Asturias, and in 1230 it was permanently united to Castile.

LEONARDO DA VINCI. This great genius, whose works in painting are classed with those of Raphael and Michael Angelo, was also a sculptor, architect, and engineer, and he cultivated successfully anatomy, botany, mathematics, astronomy, poetry, and music. He was born, in 1452, at Vinci, in the Val d'Arno, near Florence; his father, Pietro da Vinci, notary to the signiory of Florence, placed him in good time with Andrea Verrocchio, who was an able sculptor, and a good painter; but in painting, his pupil soon surpassed him. In 1483, he went to Milan, and the Duke Lodovico il Moro conferred on him an annual pension of 500 dollars. Besides performing various services for the duke, particularly as an engineer, he instituted an Academy of Arts in 1485. This Academy, of which he was named director, was attended by many eminent artists, and influenced most beneficially the Lombard school of painting. It was in 1497, when 45 years of age, that he executed his famous fresco, 'The Last Supper,' which was painted in oil on the wall in the refectory of the Dominican convent of Santa-Maria-delle-Gracie. He remained in Milan till 1500, when, on its occupation by the French, he returned to Florence, and in 1502 was appointed architect and chief engineer to Cesare Borgia, captain-general of the pope's army. In 1503, he was employed by Soderini Gonfaloniere of Florence to paint one end of the council-hall of the Palazzo Vecchio. For this, L. only completed the celebrated cartoon called the 'Battle of the Standard;' another cartoon for a painting in the same apartment, the equally celebrated design called the 'Cartoon of Pisa,' having been executed at the same time by Michael Angelo. He returned to Milan in 1513. In 1513, he visited Rome in the train of Giuliano de' Medici, who went there to assist at the coronation of his brother, Leo X.; and in 1515, accompanied Francis I. to Bologna, where he signed the concordat with Leo X. On the pressing invitation of Francis, he accompanied that monarch to France, in 1516, along with his pupils Salai and Melzi. In bad health during the whole period he was in France, he executed no paintings there, being chiefly occupied in engineering. His death occurred at Amboise, 2d May 1519. The genius of L. was universal: painting was not his sole occupation. He imparted to his works certain

qualities of the highest kind, for his drawing evinces very great delicacy and elevation of style, not modelled on the antique, but formed on a profound knowledge of nature; and in his treatment of light and shadow, he infused a degree of power, combined with softness, into his productions that invests them with a peculiar charm; while the influence of his style has operated powerfully on the schools of Milan and Parma. L.'s Treatise on Painting, *Trattato della Pittura*, has been published in several languages. The principal edition is that published at Paris, in folio, by Du Fresnoie, illustrated with drawings by Nicolas Poussin; the best, as regards the text, was published at Rome in 1817. Mr Hallam says, in his *Introduction to the Literature of Europe*: 'Leonardo's greatest literary distinction is derived from those short fragments of his unpublished writings that appeared not many years since, and which, according, at least, to our common estimate of the age in which he lived, are more like revelations of physical truths vouchsafed to a single mind, than the superstructure of its reasoning upon any established basis. The discoveries which made Galileo and Kepler and Maestlin and Maurolicus and Castelli, and other names illustrious, the system of Copernicus, the very theories of recent geologists, are anticipated by Da Vinci, within the compass of a few pages, not, perhaps, in the most precise language, or on the most conclusive reasoning, but so as to strike us with something like the awe of preternatural knowledge.' The writings referred to by Mr Hallam were published by Venturi at Paris, in 1797, under the following title: *Essai sur les Ouvrages Physico-Mathématiques de Léonard da Vinci, avec des Fragments tirés de ses Manuscrits apportés de l'Italie*. These MSS. were afterwards restored to Milan, where they are still preserved.

LEONFORTE, a Sicilian town, in the province of Messina, situated in a mountainous neighbourhood, on the shore of the Mediterranean. It is surrounded by walls, and has a pop. of 11,170 inhabitants. There is a thriving trade in oil, wine, and grain.

LEONIDAS I., son of Anaxandrides, king of Sparta, succeeded his half-brother, Cleomenes I., about 491 B.C. When the Persian monarch Xerxes approached with an immense army, L. opposed him at the narrow pass of Thermopylæ (480 B.C.) with a force of 300 Spartans, and rather more than 5000 auxiliaries. The Persians attempted in vain to win over L. by the promise of making him ruler of the whole of Greece; and when Xerxes sent a herald calling the Greeks to lay down their arms, the Spartan answered: 'Let him come and take them.' The treachery of one Ephialtes having made it impossible to bar any longer the progress of the foe, L. and his little band threw themselves on the swarming myriads, and found a heroic death.

LEONINE VERSES, the name given to the hexameter and pentameter verses, common in the middle ages, which rhymed at the middle and end. They were so named after Leoninus, a canon of the church of St Victor, in Paris, about the middle of the 12th c., or, as others say, after Pope Leo II., who was a lover and improver of music. Traces of this kind of versification appear here and there in the Roman poets, especially in Ovid, in some of whose Epistles, indeed, they are as common on an average as once in every eight lines. Camden gives some curious specimens from Walter de Mapes, Michael, the Cornish poet, and Dan Elingham, a monk of Linton. The story of the Jew who, having fallen into a refuse-pit on Saturday, would not be helped out, because it was his Sabbath, while the Christian, who offered him assistance, refused to do

so next day, because it was *his*, has been thrown into Leonine verse as follows :

*Tende manus Salomon, ego te de stercore tollam ;
Sabbata nostra colo, de stercore surgere noto.
Sabbata nostra quidem Salomon celebrabis ibidem.*

Leonine verse is not uncommon in English poetry, e. g. :

*Arethusa arose from her couch of snows
In the Acroceraunian mountains,
From peak and from crag, with many a jag,
Shepherding her bright fountains.*

LEOPARD (*Felis leopardus*), one of the larger *Felidae* (q. v.), now generally supposed to be identical with the panther (*F. pardus*), although by some they are regarded as varieties, and others still suppose them to be distinct species. Great confusion has prevailed in the nomenclature; the *panther* and *pardalis* of the ancients are not certainly known; the jaguar was erroneously described as the panther by Buffon; the puma is often called panther in

Leopard (*Felis leopardus*).

America; the L. is known by the name of tiger in Africa; and as Sir J. E. Tennent tells us, it is by mistake often called cheetah in Ceylon. Supposing the L. and panther to be one species, we may describe it as characterised by a peculiar gracefulness, slenderness and flexibility of form, with a very long tail, and spotted fur, the spots being arranged in numerous rows along the sides, and each spot composed of five or six small spots arranged in a circle or rosette. The general colour is yellowish; the lower parts lighter; the spots darker than the general colour of the fur. The L. is extremely agile, and possesses the power of leaping and also that of climbing trees in great perfection. It haunts wooded places, and is seldom to be found in open regions of long grass, like the tiger. When pursued, it takes refuge, if possible, in a tree, and if hard pressed, springs down on its assailants. It is cunning, and adopts devices similar to those of the fox for carrying on its depredations, and concealing its place of retreat. Deer and antelopes are its habitual prey; but it is equally ready to feed on pigs, poultry, or whatever may be found in the vicinity of a farm or village. The size and strength of the L. render it as dangerous to man as any of the *Felidae*; but it generally seems to dread and flee from man, unless assailed. It is very capable of domestication.

LEOPARD, in Heraldry. The leopard has been described by some heralds as the issue of the pard and lioness; and the circumstance that such hybrids are unproductive, is assigned as a reason for appropriating that animal to the armorial ensigns of abbots and abbesses. However, the representations of leopards, at least in English heraldry, are so exactly like those of the lion passant gardant, that it has been made a question whether there is any difference between the two, and it has more

especially been a keenly contested point whether the three animals in the royal escutcheon of England were lions or leopards. In early times, we find them blazoned in both ways, and the true solution of the *quæstio verata* seems to be, that at one period the heraldic leopard came to be considered as a mere synonym for the lion passant gardant, though the two animals were originally regarded as distinct. In the infancy of heraldry, before distinctive appellations were invented for the different attitudes of animals, it was customary to draw a lion in the attitude since called rampant, and a leopard as passant gardant. This difference of position sufficiently indicating which animal was meant, they were otherwise similarly represented, and no attempt was made to exhibit the spots of the leopard. By and by, as coats of armour were multiplied, it became necessary to difference them by varying the position of the animals depicted; and the blazoners of those days, thinking more of attitude than of zoology, had recourse to a compromise in their nomenclature. The lion was naturally supposed to be rampant and in profile, the leopard passant gardant. When the conventional animal that might stand for either was passant and in profile, he was designed a *lion-leopard*; and when rampant gardant, he was a *leopard-lionné*. The king of beasts was very early assumed as his appropriate insignia by the sovereign of England, as well as by the sovereigns of other countries in Western Europe. The lion was at first borne singly, and his natural attitude, like that of other lions, was considered to be rampant. But when a second and third lion were added, it became less convenient to draw them in the rampant attitude, and the lions became lions-leopard or passant, as seen in the seal of King John; a further change of position to passant gardant made them heraldically leopards. Edward III., Edward the Black Prince, and Richard II., speak of their crest of the leopard. Nicholas Serby was designated Leopard Herald in the reign of Henry IV.; and it was not till the middle of the 15th c. that the lions of England regained their original name.

Though leopards, properly so called, hardly occur in English heraldry, having passed into lions passant gardant, their heads or faces are occasionally borne. If no part of the neck is shown, the proper blazon is a leopard's face; if a portion of the neck is drawn, it is a leopard's head, erased or coupé, according as it is cut off evenly or with a jagged edge.

LEOPARDI, GIACOMO COUNT, a modern poet and classical scholar of Italy, was born at Recanati, a town in the march of Ancona, on the 29th June 1798. Without the aid of instructors, L., at the age of seventeen, had attained to a degree of classical scholarship almost marvellous. Latin and Greek he mastered as his own mother-tongue, and composed some of his philological criticisms at the age of nineteen, when he was elected member of the Academy of Science at Viterbo. Shortly after, he departed from his secluded home for Rome, where he won the friendship of several celebrated men, amongst others, of Niebuhr, who was deputed to offer him the chair of Greek philosophy, in the university of Berlin, which he declined. Ill health acting on the temperament characteristic of genius, seems to have cast a gloom over his spirit, which deeply tinged his general impressions of men and things. On his return from Rome to his native place, his health grew seriously impaired, from the ardour with which he pursued his varied studies. He finally took up his abode in Florence, where he published his admired *Cassow* and other works, amidst a conflict with failing health, straitened

finances, and deep despondency. In this bitter crisis of his life, he formed a warm friendship with the historian Antonio Ranieri; and by the delicate and incessant cares of Ranieri and his sister, the shattered, suffering poet was shielded to the hour of his death. From this period, a sensible softening of spirit became manifest in his writings; it seemed as if the poet had learned to value and cling to life and friends only when summoned to relinquish both. He died in his friend's arms at Naples, 14th June 1837, at the age of 39. His remains lie in a small church at Posillipo. The works of L. are all more or less the reflex of his morbid, desponding mind. They are remarkable for originality, vigour, and elegance of style. His collected works were published in 1849, by Le Monnier, at Florence, under the title of *Versi e Prose di Giacomo Leopardi*. His Italian love-sonnets are full of fire and grace; and his ingenious imitations of the antique form of composition, written in Greek and Latin, were so perfect, as to be mistaken by many for genuine long-lost gems of classical literature.

LEOPOLD I., GEORGE CHRISTIAN FREDERICK, King of the Belgians, son of Francis, Duke of Saxe-Coburg, was born 16th December 1790. He received an excellent literary and scientific education, and at the conclusion of his studies had the reputation of being one of the best informed princes in Europe. The marriage of his sister Juliana with the Grand Duke Constantine having closely allied the House of Saxe-Coburg with the imperial family of Russia, he became a general in the Russian army; but the menaces of Napoleon compelled him, in 1810, to resign his commission. He afterwards again joined the Russian army, and was present at the battles of Lützen, Bautzen, Leipzig, and Kulm. Having visited England after the peace of 1815, he won the affections of the Princess Charlotte, the heiress of the throne. L. was now naturalised by act of parliament in 1816, and received an annual pension of £50,000, with the title of Duke of Kendal. The marriage took place on 2d May 1816; but the princess died in childhood on 5th November 1817, and her child did not survive. Prince Leopold now lived in complete retirement, sometimes in London, and sometimes at his seat of Claremont. He received, in February 1830, the offer of the crown of Greece, and at first favourably entertained the proposal, but afterwards rejected it, because of the dissatisfaction of the Greeks with the arrangements determined upon by the Great Powers. In June 1831, he was elected, by a National Congress, king of the Belgians, and on 21st July of that year, his inauguration took place at Brussels. In 1832, he married the Princess Louise, daughter of Louis Philippe, King of the French, who died in October 1850, and by whom he has issue the Crown Prince Leopold, Duke of Brabant, another son and a daughter. As a monarch, he has conducted himself with great prudence, firmness, and moderation, with constant regard to the principles of the Belgian constitution, and an evident anxiety to advance the national welfare.

LEOPOLD OF RABENBERG or BAMBERG, the descendant of a noble family which derived its origin from the Frankish kings, was the first hereditary Markgraf of Austria (983 A.D.), and his descendants continued to rule over that country till the line became extinct, in the person of Frederick the Warlike, in 1246. This family played an important part in the Guelph and Ghibelline conflicts of the 12th c., and obtained the duchy of Bavaria, in 1138, on the rebellion of Henry the Proud, but after a long conflict with his son, Henry the Lion, was compelled to resign it to that prince in 1156.

LEPANTO (ancient *Nausipactus*), now called by the Greeks *Epacta*, the chief town of the eparchy of the same name, in the province of *Ætolia-Acarnania* in Greece, is situated on the north side of the Gulf of Lepanto, 25 miles east of Missolonghi. The town, which is ill built, and has a miserable appearance, is the seat of an archbishop, and has an excellent port. Pop. 2000. In the middle ages, it was given by the Greek emperors of the East to the Venetians, who fortified it so strongly, that in 1477, it stood a siege of four months by 30,000 Turks, and was only taken in 1499 by Bajazet II., at the head of 150,000 men. Near L., took place the celebrated naval battle between the Turks and Christians in 1571, in which the latter, commanded by Don John of Austria, (q. v.), achieved a decisive victory.

LEPIDODENDRON, a genus of fossil plants, abundant in the coal measures. Some species were of small size, but the greater number were large trees, 40 or 60 feet long, and more than 4 feet in diameter. They taper upwards, and branch generally in a dichotomous manner. The surface is

Lepidodendron.

either covered with narrow, sharp-pointed, scale-like leaves, or marked with lozenge-shaped spaces—the scars of the fallen leaves—arranged in a spiral manner. The leaves which are found separated from but associated with the trunks, have been placed in a provisional genus under the name of *Lepidophyllum*. The fruits are elongated, cylindrical bodies, composed of a conical axis, around which a great quantity of scales are compactly imbricated.

Brogniart and J. D. Hooker consider that *Lepidodendron* are gigantic Lycopods. Their modern representatives would thus be a class of small, generally creeping, moss-like plants, the largest not being more than three or four feet high. In their form and in the structure of their fruit, they certainly approach them more nearly than any other living plants; Lindley, however, sees in the *Coniferae*, and especially in the Norfolk Island pines, the closest resemblances to this ancient class of plants.

LEPIDOPTERA (Gr. scaly-winged), an order of insects, undergoing complete metamorphosis, having the mouth in their perfect state exclusively adapted for sucking, and further characterised by four membranous wings covered with minute, closely set scales. The order contains a vast number of species, abounding chiefly in warm climates; but the British species alone are about two thousand. The L. are very naturally divided into three great sections—*Diurna*, *Crepuscularia*, and *Nocturna*, so named because almost all those of the first section are to be

seen on wing only during the day, those of the second more generally during the twilight, whilst those of the third are more nocturnal; their popular designations respectively being BUTTERFLIES, HAW-MOTHS, and MOTHS. See these heads. Among the *L.* are included many of the largest and most beautiful of insects, with colours as exquisitely varied as they are brilliant; there are also many—particularly among the moths—of small size and sober hue, but not one of them can be denied the praise of beauty. The difference between the larvæ and the perfect insects in food, structure, and habits, is very wonderful. The larvæ are described in the article CATERPILLAR, the pupæ in CHRYSALIS. The perfect insect feeds only on the nectareous juices of plants. The principal organs of the mouth are the *maxillæ*, the mandibles and labrum being reduced to mere rudiments; and the maxillæ appear in the form of two long slender filaments, which combine to form a proboscis or trunk, spirally rolled up when not in use. This trunk is capable of great variety of movement, and is of extremely delicate structure.—The scales of the wings are of very various forms, but with a general similarity. Some of them are figured in the article BUTTERFLY. The wings are generally large, and are not folded when at rest. The three segments of the thorax are much united. The abdomen has neither sting nor ovipositor. None of the *L.* form societies, although great numbers are often found together. SILK is the product of some of them.

LEPIDOSIREN (or *Protopterus*), a very remarkable genus of animals, one of the connecting links between Amphibia (or Batrachia) and Fishes, and ranked by some naturalists with the former, and by some with the latter. Owen strenuously maintains the proper place of this genus to be among fishes. There are several species of *L.*, of which the best known is *L. annectans*, an inhabitant of the upper part of the river Gambia. It is about a foot long. The bones are very soft and cartilaginous, or even gelatinous, except those of the head, which resemble in substance those of osseous fishes. The scales are cycloid. The dentition is very remarkable. The

Lepidosiren.

jaws are furnished with an undulating ribbon of bone, covered with enamel, the undulations of the upper and lower jaw adapted to each other, and along the edges are small sharp teeth. There are free filamentary gills situated under gill-covers, as in osseous fishes, but two of the arterial arches, which ordinarily supply the gills of fishes with blood, are represented in *L.* by trunks, which proceed to the double air-bladder, and ramify over its cellular surface, so that the air-bladder, having a communication with the mouth, is capable of serving to a certain extent the purposes of lungs, and the animal is enabled to sustain a torpid existence during the dry season in mud, in which it forms for itself a kind of nest, which has been likened to the cocoon of an insect, by means of a mucous secretion from its body. Specimens of *L. annectans* have sometimes been brought from Africa with plants, among the roots of which they had taken up their residence. Numerous specimens have been kept alive in the Zoological Gardens of London and the Crystal Palace, and their habits have been carefully studied. They do not seem to need the

annual period of torpidity, for which, as forced upon them in their native country, they are so well prepared. They readily eat any kind of animal food, frogs are particularly acceptable; and when placed in the same tank with gold-fishes, they kill them by a single bite close to the pectoral fins, approaching them from below, biting out the piece, and often eating no more of the fish than that one bite. In its native country, the flesh of the *L.* is much esteemed.

LEPIDUS, an illustrious Roman family of the ancient Æmilian gens. It makes its first appearance in history about the beginning of the 3d c. before Christ; and was long one of the most distinguished in the patrician order, reckoning among its members many who held the greatest dignities in the state, consuls, augurs, prætors, military tribunes, censors, and heads of the priesthood. It disappears about the close of the 1st c. A. D. The only individual, however, who requires special mention, and that not because of his talents, but because of the important events in which he took a part, is MARCUS ÆMILIUS L., who, when war broke out (49 B. C.) between Cæsar and Pompey, declared for Cæsar, who appointed him, during his own absence in Spain, Dictator of Rome, a *Magister Equitum* (47 B. C.), and his colleague in the consulate (46 B. C.). He afterwards supported Antony, and became one of the triumvirate with Octavianus and Antony; but his weakness of character, and want both of military talents and of statesmanship, made him of very inferior importance to the other two, who assigned him Africa as his province (40—39 B. C.). After the defeat of Sextus Pompeius, he thought to have maintained himself in Sicily against Octavian, but his soldiers deserted him, and went over to his rival, who, however, allowed him to retain his wealth and the dignity of *pontifex maximus*. He died 13 A. C.

LEPORIDÆ. See HARE.

LEPRA is a Greek term which is now generally employed by medical writers to designate a scaly affection of the skin. These scales occur in circular patches of a grayish colour, with a red, slightly elevated margin. If the scales fall off or are removed, the surface of the skin is red and shining, and new scales rapidly form. The patches vary in size, being often about an inch in diameter, and sometimes much larger. Lepra most commonly occurs on the limbs, and especially on those parts where the bones are most thinly covered. Its duration is uncertain, and if not interrupted by treatment, it will frequently continue for years, without materially affecting the general health. It is not contagious. The local application of tar ointment, or the iodide of sulphur ointment, will sometimes remove it. If it does not yield to this treatment, small doses of Fowler's Arsenical Solution (three to five minims) may be prescribed, twice or thrice a day, either in water or in the decoction of dulcamara, which is supposed to be specially beneficial in chronic skin diseases.

LEPROSY. This term has been very vaguely used both by medical and other writers; we shall here restrict it to the *Lepra tuberculosa*, as it appears to have prevailed during the middle ages and down to modern times in Europe, and as it is now met with in various warm climates; the scaly variety, which in reality is a perfectly separate disease, being noticed in the article LEPRA. The affection here discussed is identical with the *elephantiasis* of the Greeks, and the *lepra* of the Arabians, while it is altogether different from the *elephantiasis* of the Arabians, and the *lepra* of the Greeks, which latter is the scaly *lepra* of our own day.

The most prominent symptoms of leprosy are summed up by Dr Copland in his *Medical Dictionary* as follow: 'Dusky red or livid tubercles of various sizes on the face, ears, and extremities; thickened or rugose state of the skin, a diminution of its sensibility, and falling off of the hair, excepting that of the scalp; hoarse, nasal, or lost voice; oæna; ulcerations of the surface and extreme fœtor.' These tubercles vary in size from that of a pea to an olive. Of all parts, the face is particularly affected, and especially the nose and ears.

The leprosy of Iceland, described by Dr (now Sir Henry) Holland and others, that of the Farøe and Shetland Islands, described by Dr Edmonston and others, and that still met with in Africa, in the East and West Indies, and in many tropical islands, are all identical with the disease now described—the leprosy of the middle ages.

Closely allied to it, and often confounded with it, are: 1. The *Lepra Anæsthesiaca* of Winterbottom, Copland, and others, which is characterised by remarkable absence of sensibility of the general surface, by comparative smoothness of the skin, and ulceration and falling off of the fingers and toes. The cases recorded by Winterbottom and Copland were seen in Africa.

2. The *Jewish Leprosy*, regarding which nothing certain is known. The term leprosy (or *Berat* in the Hebrew) was probably applied by the priests to various cutaneous affections, particularly those which were of a chronic and contagious nature. 'It is probable,' says Dr Copland, 'that framboesia or the yaws (a tuberculous disease) was one of these, as well as other inveterate cutaneous maladies arising from the modes of living, the habits and circumstances of the Jews at that time, and of the Egyptians; and that these maladies have changed their characters, owing to changes in the nature and combinations of their exciting causes.'

Nothing certain is known regarding the causes of this disease. The investigations of Mr Stewart at Tranquebar, where it is very prevalent, led him to conclude: 1. That women are less liable to this malady than men; 2. That it is hereditary; 3. That its contagiousness is extremely problematical; 4. That a fish-diet is found to render every symptom worse; 5. That poor living, want of cleanliness, and exposure to cold and damp, are constant attendants on this affliction. Dr Copland ascribes its origin to the use of semiputrid meat and fish, and of rancid oils; to insufficient vegetable food; and to the contact of matter discharged from leprosy sores.

The disease may continue without causing death for many years. When it is far advanced, it is probably incurable, and even in the early stages, its cure is uncertain. Probably such alterative medicines as corrosive sublimate and arsenious acid in minute doses are the most likely to be of service. Sulphur fumigating baths, and various medicated water-baths, have also been recommended.

LEPSIUS, KARL RICH., a distinguished German investigator of Egyptian antiquities, was born at Naumburg, 20th December 1813. His father, an advocate and magistrate there, was a zealous antiquary, and published many works on the antiquities of that part of Germany. The younger L. studied at Leipzig, Göttingen, Berlin, and Paris. His first work was his *Die Paläographie als Mittel der Sprachforschung* (Berl. 1834), for which he obtained the Volney prize of the French Institute. This was followed by works on the most ancient alphabets and other kindred subjects. In 1836, he associated himself intimately with Bunsen at Rome, and eagerly prosecuted his favourite studies there. Between 1834 and 1842, he published his

Lettre à M. Rosellini sur l'Alphabet hiéroglyphique (Rome), and a number of dissertations on the monuments of Egyptian art and their general architectural style, which were inserted in the *Transactions* of the Archaeological Institute. He also applied himself to the study of the ancient Etrurian and Oscan languages, the remains of which he published in his *Inscriptiones Umbricæ et Oscæ* (Leip. 1841), and other works. In 1842, he was placed at the head of an antiquarian expedition sent to Egypt by the king of Prussia, and on his return was appointed ordinary professor in Berlin. He now began to give to the world the results of his Egyptian researches, in his *Denkmäler aus Aegypten und Aethiopien* (in folio, 1853—1857), a magnificent work, published at the expense of the king of Prussia. His *Chronologie der Aegypter* (vol. i. Berl. 1849), and *Ueber den ersten Aegypt. Goetterskreis*, have laid the foundation for a scientific treatment of the earlier parts of Egyptian history. He has connected with the study of the more familiar departments of Egyptian archaeology, the investigation of the languages, history, and monuments of the regions further up the Nile. His *Briefe aus Aegypten, Aethiopien, und der Halbinsel des Sinai* (Berl. 1852), *Ueber einige Ergebnisse der Aegyptischen Denkmäler*, &c. (1853), and *Das allgemeine linguistische Alphabet* (1856), are also valuable works.

LEPTOSPERMUM, a genus of trees and shrubs, natives of Australia, New Zealand, &c., of the natural order *Myrtaceæ*, sub-order *Leptospermeæ*. They are evergreen, with leaves somewhat resembling those of myrtles. Some of them bear the name of TEA-TREE, as *L. lenigerum*, *L. baccatum*, *L. flexuosum*, and *L. grandiflorum*, because the leaves have been used as a substitute for tea. *L. scoparium* is sometimes called the *New Zealand Tea-plant*, sometimes the *Broom-tree* or *Dogwood-tree*. It is common both in New Zealand and Australia. Captain Cook's crew used its leaves for tea. They have a pleasant smell when fresh. Beer brewed with them acquires a pleasant flavour.

LERICI, a town and port on the Gulf of Spezia, which has recently gained celebrity by the imprisonment of Garibaldi within its fortress. Pop. 5217. The port is frequented by numerous vessels; the town is walled, and protected by a castle. In the 11th and 12th centuries, L. was included in the territory of Pisa, when it was strongly fortified against the rival states of Lucca and Genoa. At L., the famous transfer of Andrea Doria's services from Francis I. to the Emperor Charles V. took place.

LERIDA, a town of Spain, capital of the province of the same name, on the river Segre, a tributary of the Ebro, about 100 miles west-north-west of Barcelona. It is built partly on a plain and partly on an eminence. The town—which is important in a military point of view—is surrounded by walls and a wet fosse, and commanded by the citadel. It is a gloomy labyrinth of mean-looking streets. The castle has an old cathedral attached to it of the 13th c.; the town, a new and imposing one of the 18th century. L. carries on manufactures of woollen, cotton, leather, glass, and gunpowder. Pop. 19,581.

L. is probably the Celtiberian *Ilerda*. In the neighbouring plain, Scipio Africanus defeated Hanno, and at a later period Cæsar, the lieutenants of Pompey. A council was held at L. 564 A.D.

LERNE'ADA, an order of Crustacea, having the mouth formed for suction alone, and in organisation very inferior to any of the other crustaceans, so that the genus *Lernæa*, from which the order derives

its name, was placed even by Cuvier not among crustaceans, but *Entozoa*. The true relations of these creatures, however, after having been rendered probable by others, were finally demonstrated by Von Nordmann. A remarkable circumstance is that, when young, they resemble the higher crustaceans much more than in their mature state; having then organs for swimming, which they are capable of doing with great agility, and eyes—or an eye as in *Cyclops*, to which they exhibit much general resemblance; whilst, when mature, they are fixed to a single spot, as parasites on fishes, and are destitute both of eyes and of organs of locomotion. The number of the *L.* is very great, each kind of fish having apparently its own peculiar species of parasite. Some of them adhere to the eyes of fishes, which they render blind, some to the gills, some to other parts of the body. The ancients were acquainted with such parasites of the tunny and sword-fish, and Aristotle mentions them as causing great annoyance to the fishes infested by them. The *L.* assume in their mature state very various and grotesque forms.

LEROY DE SAINT ARNAUD, JACQUES, a French marshal of the second Empire, was born at Paris, 20th August 1801, entered the army in 1816, but found it necessary more than once to leave it, so that, in 1831, after a lapse of fifteen years, he was only a lieutenant. In 1837, he was appointed captain of the foreign legion, and first rose to eminence in the African wars. The valour he exhibited at the siege of Constantine won him the cross of the Legion of Honour. In 1840, he became a *chef de bataillon*; in 1842, a lieutenant-colonel; and in 1844, a colonel. During the rising of the desert tribes under Bou-Maza, Colonel L. de St A. signalled himself at the head of the column placed under his orders, reduced the Dahra to subjection, and made Bou-Maza a prisoner. On the termination of the campaign, he was promoted to be a Commander of the Legion of Honour. In 1847, he was raised to the rank of a field-marshal; and in the early part of 1851 carried on a bloody but successful warfare with the Kabyles. He was now appointed a general of division. At this period, Louis Napoleon was plotting the overthrow of the republic, and was on the look-out for resolute and unscrupulous accomplices; and accordingly, about the beginning of autumn, L. de St A. appeared in Paris, and was immediately appointed to the command of the second division of the city forces. On the 26th October he became war minister, and took an active part in the *coup d'état* of 2d December, and the subsequent massacres at the barricades. On the breaking out of the Crimean war in 1854, he was intrusted with the command of the French forces, and co-operated with Lord Raglan in the battle of the Alma, 20th September. He died nine days afterwards, the victim of an incurable disease.

LEBWICK, a burgh of barony, chief town of the Shetland Islands, is situated on the Mainland, on Bressay Sound, 110 miles north-east of Kirkwall. The town presents a strange appearance from having no regular streets, the only thoroughfares between the houses being badly kept and winding pathways. The harbour is commodious and safe. Pop. (1861) 3061. In 1861, 304 vessels, of 50,742 tons, entered and cleared the port. Fishing is the chief branch of industry.

LESAGE, ALAIN RENÉ, a French dramatist and novelist, born 8th May 1868, at Sarzeau, now in the department of Morbihan, and studied under the Jesuits. In 1892, he came to Paris, to pursue his philosophic and juristic studies, and to seek

employment. His personal qualities attracted the favourable regard of a lady of rank, who offered him her hand; but in 1895 he married the daughter of a citizen of Paris. He renounced the practice of his profession as an advocate to devote himself to literature, and lived entirely by his literary labours, till the Abbé de Lyon gave him a small pension of 600 livres. Some of his dramatic pieces attained great popularity; and in 1709 he was offered 100,000 francs to suppress one of them. *Turcaret*, a bitter satire on the financiers of the time, but he refused the offer. His comic novels, which have never been excelled by anything of the same kind, won for him a still higher place in literature, particularly *Le Diable Boiteux*, *Les Aventures de Guzman d'Alfarache*, and *Gil Blas de Santillane* (2 vols. Par. 1715), which is universally regarded as his master-piece. He died 17th November 1747. A complete edition of his works was published in Paris in 1730. The novels above named have been translated into different languages, and *Gil Blas*, in particular, is extremely popular even in translations.

LESBOS, the ancient name of an island in the Grecian Archipelago, belonging to Turkey, called, during the middle ages, *Mitylene* (from its capital city), and hence, by the modern Greeks, *Mitylen* or *Meino*, and by the Turks *Midilli*. It lies 40 miles south-east of Lemnos (q. v.), near the coast of Asia Minor, from which it is distant only 10 miles; area, about 600 square miles; pop. about 40,000, of whom from 15,000 to 18,000 are Turks, the rest are Greeks. *L.* is rather mountainous, but only one of the mountains attains an elevation of 3000 feet. The climate is salubrious beyond that of any other island in the *Ægean*, and the soil is fertile. Anciently, it was famous for its wines—Horace celebrates the *innocentis pocula Lesbii*—but the modern produce is indifferent. Its figs, however, are excellent; but its principal exports are oil, timber, and gall-nuts. The chief town is Castro (q. v.).—*L.* was the birthplace of Terpander, Arion, Alcæus, Sappho, Pittacus, Theophrastus, and Cratippus.

LESION, a term in Scotch Law to denote injury or prejudice sustained by a minor or by a person of weak capacity, sufficient to be a ground of action to reduce or set aside the deed which caused the lesion. See *INFANT*.

LESLIE, LESLY, or LESLEY, THE FAMILY OF. The first trace of this Scottish historical house is found between the years 1171 and 1199, when David, Earl of Huntingdon and the Garioch, brother of King William the Lion, granted a charter to Malcolm, the son of Bartholf, of the land of Leslyn (now written Leslie), a wild pastoral parish in Aberdeenshire. Bartholf's descendants, taking their surname from their lands of Leslie, acquired large domains before the end of the 13th c., by marriages with the heiresses of Rothes on the Spey, and with one of the co-heiresses of Abernethy on the Tay. Sir Andrew of Leslie appears as one of the magnates of Scotland in 1320, and from this time the family figures more or less prominently in the history of the country.

EARLS AND DUKE OF ROTHES.—It became ennobled in 1457, when George of Leslie, of Rothes, and of Leslie upon Leven (the family had transferred the name of its first possession in the Garioch to the lands of Fethkil, in Fife) was made Earl of Rothes and Lord Leslie. The third earl was the father of Norman Leslie, Master of Rothes, the chief actor in the murder of Cardinal Beaton. The fifth earl, although a man of dissolute life, distinguished himself as one of the ablest of the Covenanting leaders. His son, scarcely less able, though almost uneducated,

became Lord Chancellor of Scotland in 1667, and in 1680 was created Duke of Rothes, Marquis of Ballinbreich, Earl of Leslie, &c. These honours, being limited to the heirs-male of his body, became extinct upon his death without male issue in 1681. The earldom of Rothes went to his eldest daughter, whose descendant, the present Countess of Rothes, is the sixteenth who has held the dignity.

EARL OF LEVEN.—Before the family forsook its first seat in Aberdeenshire, it had thrown off branches, some of which still flourish there. The chief, that of Balquhain, has given birth by itself or by its offshoots to several men of mark, such as the learned John Leslie, Bishop of Ross (born in 1527, died in 1596), the devoted champion of Mary, Queen of Scots; Sir Alexander Leslie of Auchintoul, a general in the Muscovite service, who died governor of Smolensko in 1663; and Charles Leslie, chancellor of the diocese of Connor, author of a *Short Method with the Deists*, who died in 1732. A still more distinguished man was Alexander Leslie, a soldier of fortune, who, bursting the trammels of illegitimate birth and a scanty education (he could write his name, but nothing more), rose to be a field-marshal of Sweden under the great Gustavus Adolphus. He was recalled to Scotland in 1639, to take the command of the Covenanting army; and in 1641 was made Earl of Leven and Lord Balgony. He died in 1661, leaving two grandchildren, the younger of whom married the Earl of Melville, and left a son, who became third Earl of Leven and second Earl of Melville. His descendant is now eleventh Earl of Leven and tenth Earl of Melville.

LORDS LINDORES.—The second son of the fifth Earl of Rothes was created Lord Lindores in 1600. The title has been dormant since the death of the seventh lord in 1775.

LORDS NEWARK.—David Leslie, fifth son of the first Lord Lindores, served with distinction under Gustavus Adolphus of Sweden, and returning to Scotland, on the outbreak of the Great Civil War, was one of the leaders of the Parliamentary army at Marston Moor, and surprised and routed Montrose at Philiphaugh. He was defeated by Cromwell at Dunbar in 1650, and after ten years' imprisonment in the Tower, was set at liberty at the Restoration. He was made Lord Newark in 1661, and died in 1692. The title has been dormant since the death of his great-grandson, the fourth lord, in 1791.

COUNTS LESLIE.—Walter Leslie, a younger son of the House of Balquhain, distinguished himself in the Austrian army, and in 1637 was created a count of the empire, as a reward for his services in the murder of Wallenstein. He died without issue in 1667, when he was succeeded by his nephew, James, a field-marshal in the Austrian service, who died in 1694. The title, it is understood, became extinct in 1844.

The history of the Leslies was written by Father William Aloysius Leslie, a younger brother of the second count, in a large and sumptuous folio published at Grätz in 1692, with the title of *Laurus Lesliana Explicata*. The *Pedigree of the Family of Leslie of Balquhain* was printed at Bakewell in 1861, for private circulation. Some histories of the family still remain in MS. One of them boasts that 'at one time three Leslies were generals of armies in three kingdoms—Walter, Count Leslie, in Germany; Alexander Leslie, Earl of Leven, in Scotland; and Sir Alexander Leslie of Auchintoul, in Muscovy.'

LESLIE, SIR JOHN, a celebrated natural philosopher, was born in Largo, Fife, 16th April 1766. While a boy, shewing a strong bias for the exact

sciences, he was sent to St Andrews University in 1779. In 1785, he entered the Edinburgh Divinity Hall, but devoted most of his time to the sciences, particularly chemistry. In 1788, he left Edinburgh, and after being two years in America, as tutor to the sons of a Virginian planter, he returned to London in 1790. From that time till 1805 he was employed as tutor to the family of Mr Wedgewood, at Etruria, Staffordshire, in travelling on the continent, in contributing to the press, and in making experimental researches: the fruits of his labours were a translation of Buffon's *Natural History of Birds* (1793), the invention of a Differential Thermometer, a Hygrometer, and a Photometer, and the publication of an *Experimental Inquiry into the Nature and Propagation of Heat* (1804), a most ingenious work, constituting an era in the history of that branch of physical science, and for which the Royal Society awarded him the Rumford medals. In March 1805, he was, after a great deal of opposition from the Edinburgh clergy, elected Professor of Mathematics in the university of Edinburgh, and soon after commenced the publication of his *Courses of Mathematics*. In 1810, L. invented the process of artificial congelation, performed the experiment in the following year before the Royal Society of London, and in 1813 published a full explanation of his views on the subject; subsequently, he discovered a mode of freezing mercury. In 1819, he was transferred to the chair of Natural Philosophy, a position better adapted to his peculiar genius, and in 1823 published one volume of *Elements of Natural Philosophy*, never completed. In 1832, he was created a knight of the Guelphic Order; and on November 3 of the same year expired at Coates, a small estate which he had purchased near Largo. Besides the instruments above mentioned, he invented an Æthioscope, Pyroscope, and Atmometer, and contributed many articles to various periodicals on Heat, Light, Meteorology, the Theory of Compression, Electricity, Atmospheric Pressure, &c. His last important work was his discourse on the *Progress of Mathematical and Physical Science during the Eighteenth Century*, which constitutes the fifth dissertation in the first volume of the *Encyclopædia Britannica*.

LESLIE, CHARLES ROBERT, R. A. This distinguished artist was born in London in 1794. His parents were Americans resident there at the time of his birth; they went back to America in 1799, taking with them Charles Robert along with their other children. His father died in 1804, leaving the family in straitened circumstances. Young L. having, from infancy, been fond of drawing, wished to be a painter; but his mother not having the means of giving him a painter's education, he was bound apprentice to Messrs Bradford and Inakeep, booksellers and publishers in Philadelphia. He had been three years at his apprenticeship, when he managed to execute a drawing of the popular actor, George Frederick Cook. The likeness having been pronounced excellent by a number of connoisseurs, a subscription was raised to enable the rising artist to study painting two years in Europe. He accordingly returned to England in 1811, and entered as a student in the Royal Academy. He seems at first to have attempted subjects in what is called the classical style, together with portraits; but by degrees he came to follow out the bent of his genius, and turn his attention to works in that style in which he distinguished himself—viz., genre-painting of the highest class. The first picture that brought him into notice was 'Sir Roger de Coverley going to Church,' exhibited in the Royal Academy in 1819. In 1821, his picture of

'May-day in the Reign of Queen Elizabeth' secured his election as an Associate of the Academy; and 'Sancho Panza and the Duchess,' painted for Lord Egremont, and exhibited in 1824, his best work (of which there is a repetition among the paintings of the British school bequeathed by Mr Vernon to the National Gallery), obtained for him the rank of Academician. After this, till near the period of his death, there were few exhibitions of the Royal Academy to which L. did not contribute. L.'s principal pictures are embodiments of scenes from the works of many of the most popular authors—Shakespeare, Cervantes, Lesage, Molière, Addison, Sterne, Fielding, and Smollett. His works have had a great influence on the English school; and though he almost always executed repetitions of his principal works—a practice that generally leads to decrease the value of pictures—his pictures bring immense prices. Great power of expression, and a delicate perception of female beauty, are the leading points in L.'s pictures. In the early part of his career, his style may be objected to as deficient in colour, and rather dry and hard; but the influence of Newton, his talented compatriot, led him to direct his attention to the works of the Venetian masters, and impart greater richness to his colouring. Later in life, the example of Constable inclined him to strive at producing *empasto*, or fullness of surface, in his pictures. L. accepted the appointment of Professor of Drawing at the military academy of West Point, New York; but he gave up this occupation after a five months' residence, and returned to England. In 1848, he was elected Professor of Painting at the Royal Academy, but resigned in 1851. He died in London in May 1859. His lectures were published in 1845 under the title of *A Handbook for Young Painters*—a very sound and most useful work on art. A life of his intimate friend and brother-artist, Constable, whose great talent he was the first fully to appreciate, was published by him in 1845, and deservedly ranks with the best writings of that class. The *Autobiographical Recollections of Leslie*, edited by Tom Taylor, Esq. (Lond. 1860), is a very interesting book.

LESSING, GOTTHOLD EPHRAIM, an illustrious German author and literary reformer, was born January 22, 1729, at Kamen, in Saxon Upper Lusatia, where his father was a clergyman of the highest orthodox Lutheran school. After spending five years at a school in Meissen, where he worked very hard, he proceeded to the university of Leipzig in 1746, with the intention of studying theology. But he soon began to occupy himself with other matters, made the acquaintance of actors, contracted a great fondness for dramatic entertainments, and set about the composition of dramatic pieces and Anacreontic poems. This sort of life pained his severe relatives, who pronounced it 'sinful,' and for a short time L. went home; but it was his destiny to revive the national character of German literature; and after one or two literary ventures at Leipzig of a trifling character, he proceeded to Berlin in 1750, where he commenced to publish, in conjunction with his friend Mylius, a quarterly, entitled *Beiträge zur Historie und Aufnahme des Theaters*, which only went the length of four numbers. About this time also appeared his collection of little poems, entitled *Kleinigkeiten*. After a brief residence at Wittenberg, in compliance, once more, with the wishes of his parents, he returned to Berlin in 1753, and in 1755 produced his *Miss Sara Sampson*, the first specimen of *bourgeoisie* tragedy in Germany, which, in spite of some hostile criticism, became very popular. L. now formed valuable literary friendships with Gleim, Ramler, Nicolai, Moses

Mendelssohn, and others. In company with the last two, he started (1757) the *Bibliothek der Schönen Wissenschaften*, the best literary journal of its time, and still valuable for its clear natural criticism; he also wrote his *Fabeln*, his *Literaturbriefe*, and a variety of miscellaneous articles on literature and aesthetics. Between 1760—1765, he lived at Breslau as secretary to General Tauenzien, governor of Silesia. The year after his return to Berlin, he published his master-piece, the *Laocoon*, perhaps the finest and most classical treatise on æsthetic criticism in the German or any other language. In 1767, appeared *Minna von Barnhelm*, a national drama, hardly less celebrated than the *Laocoon*; and in 1768, his *Dramaturgie*, a work which exercised a powerful influence on the controversy between the French and the English styles of dramatic art—i.e., between the artificial and the natural, between the conventional and the true, between shallow and pompous rhetoric, and genuine human emotion. In 1770, L. was appointed keeper of the Wolfenbüttel Library. Two years later appeared his *Emilie Galotti*; and between 1774—1778, the far-famed *Wolfenbüttelschen Fragmente eines Ungenannten*. These Wolfenbüttel Fragments are now known to have been the composition of Reimarus (q.v.), but the odium of their authorship fell at the time on L., and he was involved in much bitter controversy. In 1779, he published his *Nathan der Weise*, a dramatic exposition of his religious opinions (his friend Moses Mendelssohn is said to have been the original of Nathan); and in 1780, his *Erziehung des Menschen*, a work which is the germ of Herder's and all later works on the Education of the Human Race. He died February 15, 1781. L. is one of the greatest names in German literature. If his works seem hardly equal to his fame, it is because he sacrificed his own genius, as it were, for the sake of others. When he appeared, the literature of his country was corrupted and enlaved by French influences. The aim of L. was to reinvigorate and emancipate the national thought and taste; and the splendid outburst of national genius that followed, was in a large measure the result of his labours. Compare Adolf Stahr's *G. E. Lessing, Sein Leben und Seine Werke* (2d. edit. Berlin, 1862).

LETHAL WEAPON, in Scotch criminal law, means a deadly weapon by which death was caused, as a sword, knife, pistol.

LETHÉ, in Grecian Mythology, the stream of forgetfulness in the lower world, from which souls drank before passing into the Elysian Fields, that they might lose all recollection of earthly sorrows.

LETTER OF MARQUE (because the sovereign allowed a market or mart—i.e., authorised the disposal of the property taken), the commission authorising a privateer to make war upon, or *seize* the property of, another nation. It must be granted by the Lords Commissioners of the Admiralty, or by the vice-admiral of a distant province. Vessels sailing under such commissions are commonly spoken of as *letters of marque*. Making war without letters of marque by a private vessel is piracy. Letters of marque were abolished among European nations at the treaty of Paris in 1856.

LETTERS, a legal term used in the United Kingdom in combination with other words. *Letters of Administration* in England and Ireland mean the legal document granted by the Probate Court to a person who is appointed administrator to a deceased person who has died intestate. See ADMINISTRATION, WILL, INTERSTACY. *Letter of Attorney*, or power of attorney, in English law, is a writing or deed authorising an agent (whether he is a certificated attorney or not) to do any lawful act

LETTERS—LETTERS AND ARTICULATE SOUNDS.

in the stead of the party executing it. *Letters conform*, in Scotch law, mean a writ issued by the supreme court enforcing a decree of an inferior court. *Letter of credit* is an authority from one banker to another to pay money to a third person. *Letters of execupation*, in Scotch criminal law, are a warrant obtained by a prisoner to summon witnesses on his behalf at his trial. *Letter of guarantee*, in Scotch law, means a writing guaranteeing a debt or engagement of another. *Letter of licence* is a deed or instrument executed by the creditors of a trader who is insolvent, giving him time to pay, and, in the meantime, to carry on his business under surveillance. *Letters missive*, in England, is an order from the Lord Chancellor to a peer requesting the latter to enter an appearance to a bill filed in Chancery against such peer; in Scotland, the word means any written agreement or memorandum relative to some bargain as to mercantile matters, or as to the sale of land or houses or the letting of land. *Letters patent* mean a writing of the Queen, sealed with the Great Seal of Great Britain, authorising or appointing the party to whom it is addressed to do some act, or execute some office, as creating a peer; a judge, a Queen's Counsel; also granting a patent right to a person who is the first inventor of some new contrivance. See **PATENT**. *Letters of request*, in English ecclesiastical law, mean a writ which commences a suit in the Court of Arches against a clergyman, instead of proceeding, in the first instance, in the Consistory Court. *Letters of safe conduct* mean a writ, under the great seal, to the subject of a state at war with this country, authorising and protecting such subject while dealing or travelling in this country, so that neither he nor his goods may be seized, as they otherwise might be.

LETTERS AND ARTICULATE SOUNDS.

Letters are conventional marks or visible signs of the elemental sounds of spoken language. The earliest symbols of sounds represented syllables rather than simple sounds (see **ALPHABET**, **HEROGLYPHICS**, **CHINESE LANGUAGE**). It was only gradually that syllables were reduced to their ultimate elements, and all alphabets yet bear marks of their syllabary origin (see letter **K**), displaying various imperfections both of excess and defect.

Articulate sounds are divided into vowels and consonants; and the latter are subdivided into voiceless and vocal elements (otherwise called 'sharps' and 'flats'), obstructive and continuous elements (otherwise called 'mutes' and 'semi-vowels'), and liquids. Many other divisions have been proposed, but the above classification embraces all real varieties. The elements are likewise classified according to the organs which form them, as labials, linguals, gutturals, nasals, &c. A physiological description of the articulate sounds used in English speech, will shew the necessary extent of a perfect system of letters, and exhibit the shortcomings of our present alphabet.

All the elements of speech are susceptible of separate formation; and in the following description, reference is always intended to the exact sound of each element, and not to the names of the letters.

Emitted breath mechanically modified forms every articulate sound: The breath is first modified in the throat, by a certain amount of constriction in the larynx, wanting which restraint, the air would flow out noiselessly, as in ordinary breathing, or gushingly, as in sighing. The breath is thus economised into a steady stream, and rendered audible by the degree of roughness or 'aspiration' it acquires when forced through a narrow aperture. This 'aspirated' current of air, when articulated, forms whispered speech. In passing through the larynx, the breath is further acted on by the

opposing ligaments of the glottis (the aperture of the larynx), and sonorous voice is produced. The vocalised or aspirated breath receives vowel and articulate modification in its passage through the mouth. When the mouth is sufficiently open to allow the breath to flow without obstruction or oral aspiration, the air is moulded into the various qualities of vowel-sound; and when the channel of the mouth is obstructed, or narrowed so much as to cause a degree of aspiration of the breath between the tongue and the palate, the lips, &c., consonant-sounds are produced.

The upper part of the mouth is an immovable arch: all variations in the shape of the oral passage are consequently effected by the tongue and the lips. [A nasal variety of vowel-sounds occurs in French—represented by *n* after the vowel-letters. These sounds are formed by depressing the soft palate, which otherwise covers the inner end of the nostrils, and allowing part of the breath to pass through the nose, while the remainder is modified in the usual way.]

Vowels.—When the tongue is raised in its greatest convexity towards the roof of the mouth, but without being so close as to roughen or asperate the breath, the resulting vowel quality is that heard in the word *ee*; and progressively less degrees of elevation produce a series of lingual vowels, of which *Ä* is the most flattened—the lips being equally expanded throughout the series, to allow the breath to escape without labial modification.

When the aperture of the lips is contracted in the greatest degree short of asperating the breath, the resulting vowel-quality is that heard in the word *ooze*; and progressively less degrees of labial contraction form a series of labial vowels, of which *Äu* is the most open—the tongue being retracted throughout the series, to direct the breath without lingual modification forward against the lips.

A third series of vowels is formed by combining elevated positions of the tongue and contracted positions of the lips, or retracted positions of the tongue, and expanded positions of the lips. Of this labio-lingual series, the German *ü* is the most contracted, and the English sound heard in the word *err* the most open.

The following table shews the principal vowels of each class:

	Lingual.	Labio-Lingual.	Labial.
Close,	<i>ee(i)</i>	<i>ü</i>	<i>oo(x)</i>
Medial,	<i>ai(i)</i>	<i>ou</i>	<i>oi(k)</i>
Open,	<i>e(re)</i>	<i>ö</i>	<i>o(re)</i>
	<i>ah</i>	<i>e(rr)</i>	<i>au(i)</i>

The possible modifications of the oral channel are endless, and untraceably minute, as are the shades of vowel-quality heard in dialects, and among individual speakers. In English, there are altogether *thirteen* established varieties, as heard in the words *ee, ill, ale, ell, an, ask, ah, err, up, all, ore, old, ooze*. Besides these, which a perfect alphabet must represent, we have the diphthongal sounds heard in the words *ie, oval, oil*, and the aspirated compound *yoo*—the sound of the letter *u* in *use*—which is often, but erroneously, supposed to be a diphthongal vowel.

The Aspirate H.—The letter **H** (see **ASPIRATE**) represents an expulsive breathing, modified by the form of the vocal element which follows it—as in *he, hay, high, hoe*, &c., in which the **H** will be observed to have the quality of *ä, ä, i, ö, &c.*, but without the laryngeal contraction, and consequent aspiration of the breath, which forms a whispered vowel.

Consonants.—When the tongue is raised convexly against the back of the palatal arch so as to stop the breath, the separation of the tongue from the roof

or back of the mouth is accompanied by a percussive effect, which is represented in the English alphabet by C, K, and Q, and by G when the obstructed breath is vocalised. While the tongue is in this obstructive position, if the soft palate be depressed so as to uncover the inner end of the nostrils, the breath will pass through the nose. This, with vocalised breath, is the formation of the element represented in English, for lack of an alphabetic character, by the digraph *ng*.

[The percussive effect of K—G is slightly modified by the point at which the tongue leaves the palate before different vowels, as in the words *key* and *caw*; the consonant of the latter word being struck from the soft palate, and that of the former word further forward, from the hard palate. A peculiar Anglicism of pronunciation is derived from the substitution of the anterior for the posterior formation of K—G in certain words, as *kind*, *card*, *guide*, *guard*, *girl*, &c.]

When the fore-part of the tongue is raised to the front of the palate, so as to stop the breath, the separation of the tongue is accompanied by the percussive effect which is represented by T, and by D when the obstructed breath is vocalised. The uncovering of the end of the nostrils while the tongue is in this obstructive position produces, with vocalised breath, the sound represented by N.

When the lips are brought in contact (the lower lip rising to join the upper lip), their separation from the obstructive position is accompanied by the percussive effect represented by P, and by B when the obstructed breath is vocalised. The uncovering of the nares while the lips are in contact, produces, with vocalised breath, the sound represented by M.

The remaining consonants are all of the continuous or non-obstructive class; the organs of articulation being so placed as merely to narrow the apertures, central or lateral, through which the breath issues with a degree of hissing or asperation.

The elevation of the base of the tongue so as to leave a narrow aperture between its centre and the back-part of the palate, forms, with vocalised breath, the sound of Y initial as in *ye*. The sound of *y* resembles that of the vowel *é*, but with the contracted aperture and resulting oral asperation of the breath essential to a consonant. The same position with voiceless breath forms the German *ch* as in *ich*—an element which is heard in English as the sound of H before *é*, as in *hue*. [The Scotch guttural heard in *loch* differs from this only in the more retracted position of the tongue, which is approximated to the soft instead of the hard palate. The same position with vocalised breath produces the soft Parisian *burr*. The approximation of the concave root of the tongue to the fringe of the soft palate causes the uvula to flutter in the breath, and forms the rough Northumbrian *burr*.]

The elevation of the middle of the tongue towards the front of the palatal arch, with a narrow central passage for the breath, produces the element which, for lack of an alphabetic character, is represented by the digraph *Sh*; and the same position forms, with vocalised breath, the common element heard in *pleasure*, *seizure*, &c., but which has no appropriate literal symbol in English.

The approximation of the flattened point of the tongue to the front of the mouth, so as to leave a narrow central passage between the tongue and the upper gum, forms the sound represented by S; and by Z when the breath is vocalised.

The elevation of the tip of the tongue towards the rim of the palatal arch causes a degree of vibration of the edge of the tongue, and consequent asperation of the breath, proportioned to the degree of elevation, which is the English sound of the letter R.

[R final, or before a consonant, has little or no asperation, but has almost the pure sonorousness of a vowel, as in *err*, *earn*, &c. The roughly trailed Scotch or Spanish R is formed by the quivering of the whole fore-part of the tongue as it is laxly approximated to the palate.]

The approximation of the lower to the upper lip, so as to leave a central aperture for the breath, produces, with vocalised breath, the sound of W initial, as in *woo*. The sound of *w* resembles that of the vowel *oo*, but with a more contracted aperture. The same position, with voiceless breath, forms the element represented, for lack of an alphabetic character, by the digraph *Wh*.

The remaining varieties of English articulate sounds are formed by forcing the breath through lateral apertures, instead of one central aperture.

When the fore-part of the tongue is spread against the front of the palate, and vocalised breath passes laterally over the middle of the tongue, the sound of L is heard. [The same position of the tongue forms, with voiceless breath, the sound of *Ll* in Welsh. The English L, as heard before *ü* (= *yoo*) is modified by convexity of the back-part of the tongue towards its position for Y, forming the sound which is represented in Smart's Dictionary by *L'*, as in *lure*, pronounced *loor*. A peculiar Gaelic variety of L is formed by raising the back-part of the tongue to the soft palate, and passing the voice laterally over the root of the tongue.]

When the tip of the tongue is applied to the upper teeth (or the gum), and the breath is emitted laterally over the point of the tongue, the sound of the digraph *Th* as in *thin* is heard; and, with vocalised breath, the sound of *Th* in *then*—neither of which elements is represented in our alphabet.

When the middle of the lower lip is applied to the edge of the upper teeth, and the breath is emitted laterally between the teeth and the lip, the sound represented by F is produced; and, with vocalised breath, the sound of V.

Liquids.—The voice is so little intercepted in passing through the nostrils (forming *m*, *n*, or *ng*), and through the wide apertures of L, and also of R when not initial in a syllable, that the sound has almost the pure sonorousness of a vowel; and these elements have received the name of *Liquids*, to designate their property of syllabically combining with voiceless consonants—seeming to flow into and to be absorbed by them, and losing much of their natural quantity as vocal sounds; as in *lamp*, *temse*, *tent*, *sense*, *tenish*, *ink* (= *ingh*), &c.; *milk*, *spilt*, *help*, *self*, *else*, *Welsh*, *health*, &c.; *hark*, *heart*, *harp*, *serf*, *earth*, *harsh*, *horse*, &c. The characteristic effect of the Liquids will be best perceived by contrasting such words as *temse* and *Thames*, *hence* and *hens*, *else* and *ells*, *curse* and *curs*—in which the normal influence of vocal consonants on subsequent elements is manifested in the vocalising of the sibilant in the second word of each pair.

From this review of the physiological varieties of articulate sounds, it will be evident that our alphabet of 26 letters is very imperfect, both by redundancy and deficiency. (1.) The same sounds are represented by more than one letter; as C, K, and Q; C and S; G and J. (2.) The same letter represents more than one sound; as C, which is sometimes K, and sometimes S; G, which is sometimes the vocalised form of K, and sometimes J; N, which is sometimes N, and sometimes *ng*; S, which is sometimes S, and sometimes Z; and Y, which is sometimes a consonant (when initial), and sometimes a vowel, sounded like the letter L. (3.) Single letters are used to represent articulate compounds; as G and J, which are sounded *dzh* [the voiceless form of J is represented by *ch*, as in *chair*]; U, which is

sounded *yoo*; and *X*, which is sounded *ks*, and sometimes *gz*. (4) The alphabet contains no characters for six of our undoubted consonant elements—viz., *Wh*, *Th(in)*, *Th(en)*, *Sh*, *Zh*, *Ng*. (5) Each vowel-letter represents many sounds; and the lack of seven characters to denote the excess of our vowel-sounds over the number of our vowel-letters, is supplied by about sixty combinations of two or of three letters, so that the original phonetic character of the alphabet is almost entirely lost in the confusion of our orthography.

Consonants form, as it were, the bare and bony skeleton of speech; vowels give definite shape and individuality to words. Thus the consonants *sprt* constitute the common skeleton of such diverse words as *sport*—*spirit*, *sprat*—*sprike*, *spirit*, *support*, *separate*, *aspirate*—*asperate*, which receive their distinct configuration and filling up from the vowel-sounds, which cover the consonant skeleton with moulded elegance and variety. Consonants are thus the more stable elements of words, and their interchanges in the corresponding words of allied tongues are found to follow certain general laws dependent on the relations and affinities of letters. See GRAMM'S LAW. These relations are exhibited in the following table:

	SHUT.		OPEN.		NASAL.	
	Sharp.	Flat.	Sharp.	Flat.	Sharp.	Flat.
1. Labials.	<i>p</i>	<i>b</i>	<i>f</i> <i>wh</i> <i>sh</i>	<i>v</i> <i>w</i> <i>zh</i>	†	<i>m</i>
2. Linguals.	<i>t</i>	<i>d</i>	<i>s</i> <i>ss</i> <i>h</i> (Welsh)	<i>z</i> <i>zh</i> <i>gh</i> (Welsh)		<i>n</i>
3. Gutturals.	<i>k</i>	<i>g</i>	<i>ch</i> (Welsh) <i>ch</i> (Welsh)	<i>gh</i> <i>g</i>		<i>ng</i>

In pronouncing the letters of the first class, the lips are chiefly concerned; in the second, the principal organ is the tongue, or the tongue and the teeth (whence they are also called *dentals*); and in the third, the back-parts of the tongue and palate are employed. But while all the sounds of each class have thus a common organic relation, the first pair differs from the other letters of the same class by being *obstructive* or *shut*—otherwise called *Mute* (q. v.); the remaining letters, having open apertures, are *continuous* or *sibilant* in effect—otherwise called *Asperate* (q. v.). The difference also between the members of the several pairs is of the same kind throughout; *p* differs from *b* as *f* does from *v*, or *t* from *d*, or *ch* from *gh*.

Various attempts have been made, hitherto unsuccessfully, to introduce a system of phonotypes, in which each sound should be represented by one invariable character; see PHONETIC WRITING. In Mr Ellis's *Plea for Phonetic Spelling*, and Mr Melville Bell's *Principles of Speech*, the student will find the most recent and complete developments of the theory of Articulate Sounds which have appeared in this country.

LETTER-WOOD, one of the most beautiful productions of the vegetable kingdom; it is the heart-wood of a tree, found sparingly in the forests of British Guiana, the *Piratinera Guianensis* of Aublet, and the *Brosimum Aubletii* of Poeppig,

belonging to the Bread-fruit family (*Artocarpaceae*). It grows from 60 to 70 feet high, and acquires a diameter of from 2 to 3 feet. The outer layers of wood (alburnum) are white and hard; the central portion, or heart-wood, which rarely exceeds 7 inches in thickness, is extremely hard and heavy, and is of a rich dark-brown colour, most beautifully mottled with very deep brown, almost black spots, arranged with much greater regularity than is usually the case in the markings of wood, and bearing a slight resemblance to the thick letters of some old black-letter printing. Its scarcity and value make it an article of rare and limited application. It is used only in this country for fine veneer and inlaying work, and in Guiana for small articles of cabinet-work. The natives make bows of state of it, but are said to prefer a variety which is not mottled.

LETTRES DE CACHET, the name given to the famous warrants of imprisonment issued by the kings of France before the Revolution. All royal letters (*lettres royales*) were either *lettres patentes* or *lettres de cachet*. The former were open, signed by the king, and countersigned by a minister, and had the great seal of state appended. Of this kind were all ordinances, grants of privilege, &c. All letters-patent were registered, or *enterained*, by the parliaments. But these checks on arbitrary power did not exist with regard to *lettres de cachet*, also called *lettres closes*, or sealed letters, which were folded up and sealed with the king's little seal (*cachet*), and by which the royal pleasure was made known to individuals or to corporations, and the administration of justice was often interfered with. The use of *lettres de cachet* became much more frequent after the accession of Louis XIV. than it had been before, and it was very common for persons to be arrested upon such warrant, and confined in the Bastille (q. v.), or some other state prison; where some of them remained for a very long time, and some for life, either because it was so intended, or, in other cases, because they were forgotten. The lieutenant-general of the police kept forms of *lettres de cachet* ready, in which it was only necessary to insert the name of the individual to be arrested. Sometimes an arrestment on *lettres de cachet* was a resource to shield criminals from justice.

LETTUCE (*Lactuca*), a genus of plants belonging to the natural order *Compositae*, sub-order *Ochioraceae*, having small flowers with imbricated bractes, and all the corollas ligulate, flatly compressed fruit, with a thread-like beak, and thread-like, soft, deciduous pappus.—The GARDEN L. (*L. sativa*) is supposed to be a native of the East Indies, but is not known to exist anywhere in a wild state, and from remote antiquity has been cultivated in Europe as an esculent, and particularly as a salad. It has a leafy stem, oblong leaves, a spreading flat-topped panicle, somewhat resembling a corymb, with yellow flowers, and a fruit without margin. It is now generally cultivated in all parts of the world where the climate admits of it; and there are many varieties, all of which may, however, be regarded as sub-varieties of the COSS L. and the CABBAGE L., the former having the leaves more oblong and upright, requiring to be tied together for blanching—the latter with rounder leaves, which spread out nearer the ground, and afterwards *bol* or roll together into a head like a small cabbage. The L. is easy of digestion, gently laxative, and moderately nutritious, and is generally eaten raw with vinegar and oil, more rarely as a boiled vegetable. The white, and somewhat narcotic milky juice of this plant is inspissated, and used under the name of *Lactucarium* (q. v.), or *Thridace*,

* The 'sharp' or voiceless *t* is of frequent but unrecurrent occurrence. It is heard in French, as the sound of *t* final after a consonant, as in *theatre*; and in Scotch, as a substitute for *thr*, as in *three*, pronounced *ree*.

† The 'sharp' forms of the nasals are in constant use as interjectional sounds, as in *humph*! (pronounced 'Am/), 'Am/ (expressive of sneering), and 'mhm/ used as an affirmative in Scotland.

as an anodyne, sedative, opiate medicine. The best and most useful kind of this juice is obtained by making incisions in the flowering stems, and allowing the juice which flows to dry upon them. Lettuces are sown in gardens from time to time, that they may be obtained in good condition during the whole summer. In mild winters, they may be kept ready for planting out in spring.—The other species of this genus exhibit nothing of the bland quality of the garden lettuce.—The STRONG-SCENTED L. (*L. virosa*) is distinguished by the prickly keel of the leaves, and by a black, smooth seed, with a rather broad margin. It is found in some parts of Britain. *Lactucarium* is prepared from its fresh-gathered leaves, in the flowering season. The leaves have a strong and nauseous, narcotic and opium-like smell.—*L. perennis* adorns with beautiful blue flowers the stony declivities of mountains and clefts of rocks in some parts of Germany, as in the Harz, &c., but is not a native of Britain, which, however, possesses one or two other species in qualities resembling *L. virosa*.

LEUCADIA, the ancient name of SANTA MAURA (q. v.).

LEUCHTENBERG. See BEAUFARNAIS.

LEUCINE (derived from the Greek word *leucos*, white) belongs to the class of bodies to which chemists now apply the term amido-acids, and which are substances in which one equivalent of the hydrogen of the radicle of an acid is replaced by one equivalent of amidogen (NH_2). The empirical formula for leucine is $\text{C}_6\text{H}_{11}\text{NO}_4$, while that of caproic acid (whose amido-acid it is supposed to be) is $\text{C}_6\text{H}_{11}\text{O}_4$. It is obvious that if for one of these twelve equivalents of hydrogen one equivalent of amidogen is substituted, the latter formula becomes $\text{C}_6\text{H}_{11}(\text{NH}_2)\text{O}_4$, which contains the same equivalents as the formula $\text{C}_6\text{H}_{11}\text{NO}_4$, but indicates more closely their mode of grouping.

Leucine is of great importance in physiological chemistry, being a constituent of most of the glandular juices of the body. Considering the sources from which it is obtained artificially, there can be no doubt that the leucine found in the body is one of the numerous products of the regressive metamorphosis of the nitrogenous tissues.

LEUCIPPUS, the founder of the Atomistic School of Grecian philosophy, and forerunner of Democritus (q. v.). Nothing is known concerning him, neither the time nor the place of his birth, nor the circumstances of his life.

LEUCISCUS, a genus of fresh-water fishes, of the family *Cyprinidae*, containing a great number of species, among which are the Roach, Ide, Dace, Graining, Chub, Red-eye, Minnow, &c. There are no barbels. The anal and dorsal fins are destitute of strong rays.

LEUCOCYTHEMIA (derived from the Greek words *leucos*, white, *cytos*, a cell, and *hæma*, blood) is a disease in which the number of white corpuscles in the blood appears to be greatly increased, while there is a simultaneous diminution of the red corpuscles. The disease was noticed almost at the same time (in 1850) by Bennett of Edinburgh and Virchow of Würzburg; the former giving it the name standing at the beginning of the article, while the latter gave it the less expressive name of *Leukæmia*, or *White Blood*.

The increase of the white or colourless corpuscles seems to be always accompanied, and probably preceded, by other morbid complications, of which the most frequent are enlargement of the spleen, of the liver, and of the lymphatic glands. In nineteen cases, it was found that enlargement of the spleen

was present in sixteen, enlargement of the liver in thirteen, and enlargement of the lymphatics in eleven instances. Hence, tumefaction of the abdomen is one of the most prominent symptoms.

The microscopic examination of a single drop of blood is sufficient to determine the nature of the disease. The causes of leucocythemia are unknown; and although the most varied remedies have been tried, the disease is almost invariably fatal.

LEUCOL, LEUCOLINE, or QUINOLINE ($\text{C}_{10}\text{H}_7\text{N}$), is one of the compounds obtained by the distillation of coal-tar. It is also obtained by the distillation of quinine, cinchonine, or strychnine with potash. It is a colourless and strongly refracting oil, which boils at about 460° , has a specific gravity of 1.081, is insoluble in water, is soluble in alcohol and ether, and neutralises acids, forming crystallisable salts with them. On boiling two parts of leucol with three of iodide of amyl, crystals are obtained, which, when dissolved in water, treated with an excess of ammonia, and boiled for some time, yield a resinous substance, which is readily soluble in alcohol, and furnishes a splendid blue dye.

LEUCOMA (derived from the Greek word *leucos*, white) is the term applied to a white opacity of the cornea—the transparent front of the Eye (q. v.). It is the result of acute inflammation, giving rise to the deposition of coagulable lymph on the surface, or between the layers of the cornea. It is sometimes re-absorbed on the cessation of the inflammation, and the cornea recovers its transparency; but in many cases it is persistent and incurable.

LEUCTRA, anciently, a village of Boeotia, in Greece, famous for the great victory which the Thebans under Epaminondas (q. v.) here won over the Spartan king Cleombrotus (371 B.C.), in consequence of which the influence exercised by Sparta for centuries over the whole of Greece was broken for ever.

LEUK, a small town (pop. about 600) in the canton of Valais, Switzerland, on the right bank of the Rhone, 15 miles above Sion. It is noted in association with the *Baths* of Lenk, situated 8 miles northward at the head of the valley of the Dala and the foot of the ascent over the Gemmi pass. At this place, which is 4500 feet above the sea, there is a hamlet of 300 inhabitants, and several lodging-houses and hotels for the accommodation of patients and travellers. The springs have a high temperature (120°F.), are slightly saline, chalybeate, and sulphureous, and are used both for drinking and bathing. They are chiefly useful in diseases of the skin; and one peculiarity is the length of time the patients remain in the baths—as long as 8 hours a day. For this purpose there are several apartments of 20 feet square, in which as many as 15 or 20 persons of both sexes, clad in long woollen dresses, bathe in common; sitting up to their necks in water, they beguile the time with conversation, chess, reading the newspapers, &c. There appears to have been a bathing establishment here as early as the 12th century.

LEUTHEN, a village of Prussia, in Lower Silesia, 9 miles west of Breslau. Pop. 894. It is celebrated for the victory won there, 5th December 1757, by Frederick the Great, with 33,000 men, over the Austrians under Prince Charles of Lorraine at the head of 92,000. The Austrians lost 7000 killed and wounded, 21,500 prisoners, and 134 pieces of artillery; the Prussians only 3000 killed and wounded. The result of this victory was the reconquest of the greater part of Silesia by the Prussians.

LEVANT—LEVER.

LEVANT, THE—from the Italian *Il Levante*, the *Orient*, or *Rising*, that is, the East—a name employed throughout the whole of Europe to designate the eastern parts of the Mediterranean Sea and adjacent countries. In a wider sense, it is applied to all the regions eastward from Italy, as far as the Euphrates and the Nile; but more generally is used in a more restricted sense, as including only the coasts of Asia Minor, Syria, and Egypt.

LEVANT AND COUCHANT, a phrase in English Law applied to cattle which have strayed into another's lands, and have been so long there that they have lain down and slept there.

LEVARI FA'CIAS, WRIT OF, in English Law, is a writ of execution issued upon a judgment, by which the judgment creditor takes the real and personal estate, such as lands, houses, furniture, &c., of his debtor to satisfy his debt. The mode by which this was done was by the sheriff drawing the rents and paying the creditor. The writ is now practically superseded by the writ of *Elegit* (q. v.) as regards real estate, and *Fieri Facias* (q. v.) as regards personal estate.

LEVEE, the state ceremonial of the sovereign receiving visits from those subjects whose position entitles them to that honour. By the usage of the court of Great Britain, a levee differs from a drawing-room in this respect, that gentlemen only are present (excepting the chief ladies of the court), while at a drawing-room both ladies and gentlemen appear. The name is owing to such receptions being originally held in the monarch's bedchamber at the hour of rising (*Fr. lever*).

LEVEE, the French name for an Embankment (q. v.).

LEVEL AND LEVELLING. Level is a term applied to surfaces that are parallel to that of still water, or perpendicular to the direction of the plumb-line; it is also applied to the instrument employed in determining the amount of variation from perfect levelness. The instrument is a cylindrical glass tube very slightly convex on one side, and so nearly filled with water, or, what is better, with alcohol, that only a small bubble of air remains inside. The level is then mounted on a three or four legged stand, with its convex side upwards, and by means of a pivot and elevating screws, is made capable of assuming any required position. If the level be properly constructed, the bubble should lie *exactly* in the middle of the tube when the instrument is properly adjusted, and, at the same time, the line of sight of the telescope attached to the level should be accurately parallel to the surface of still water. In ordinary levels, this first condition is seldom seen, and, instead, two notches are made on the glass to mark the position

a pole from 10 to 14 feet high, and graduated to feet and inches, or feet and tenths of feet. If he wishes to measure the height of A above B, he may do this by beginning either at A or B. Let the latter be the case, then one assistant is placed at B, holding his pole upright; the other is sent forward to C (which must be below the level of the top of the pole at B); the surveyor, who places himself between them, reads off the height Bb, which he puts down in the back-sight column of his book, and then turns the level to C, reading off Co, which is entered in the front-sight column. The surveyor and his assistant at B then take up new positions, the latter at D; the back-sight Cc and the front-sight Dm are read off, and the process is repeated till one of the assistants reaches A. The excess of the sum of the back-sights over that of the front-sights gives the height of A above B. A little consideration will shew that this method can only hold true when practised on a small scale, and consequently in extensive surveys, the level (as found by the above-described method) requires to be reduced by an allowance for the earth's curvature.

LEVEN, LOCH, a beautiful sheet of water, of an oval form, in the east of Kinross-shire, Scotland, measuring between 10 and 11 miles in circuit, and dotted here and there with small islands, the chief of which are, St Serf's Inch, at the east end, 80 acres in extent, with the remains of a religious house of great antiquity (see *CULDEES*), and another of 5 acres, opposite the town of Kinross, on which stand the ruins of Loch Leven Castle. The loch is supplied by several small streams, and empties itself by the Leven into the Firth of Forth. It has long been celebrated for the quantity and quality of its trout, which are of excellent flavour, and average about a pound in weight, although some are found of 4, 6, and even 10 lbs. Pike and perch also occur; a pike was caught in 1846 weighing 29 lbs. The rich colour of the Loch L. trout is due to the abundance of a certain kind of crustacea upon which they feed. Loch Leven Castle is connected with several events in Scottish history, the most noted being the imprisonment of Queen Mary in June 1567. Here she was forced to sign her abdication of the throne; and, after one unsuccessful attempt, succeeded, by the aid of George Douglas, the governor's brother, and of Willie Douglas, 'a foundling,' supposed to be a relative of the family, in effecting her escape (2d May 1568).

LEVEN, LOCH, an arm of the sea, or rather of Loch Linnhe (q. v.), on the west coast of Scotland, between Argyll and Inverness, is about 11 miles in length by, on an average, less than one mile in breadth, and is remarkable for the wildness and grandeur of its scenery. The current produced in this loch by the ebb and flow of the tide runs at the rate of at least 4 miles an hour.

LEVER, the most simple and common, but, at the same time, most important of the seven mechanical powers, consists of an inflexible rod—straight or bent, as the case may be—supported at some point of its length on a prop which is called the *fulcrum*, and having the *weight* to be moved and the *power* to move it applied at other two points. In the accompanying illustration (fig. 1, a), AB is the lever, F the fulcrum, A and B the points of application of P and W, the power (or pressure) and weight respectively.

Fig. 1, a.

If the arms AF and BF be equal, the power P and the weight W must also be equal to produce equilibrium; if the arm of the power, AF, be longer

of the two extremities of the bubble when the instrument is level. The tube and bubble should be of considerable length to insure accuracy. The leveller requires two assistants, each furnished with

than the arm of the weight, BF, then, to produce equilibrium, the power P must be less than the weight W, and *vice versa*; if AF be double the length of BF, then P, to produce equilibrium, must be half of W; and, generally, as is shown in the elementary treatises on mechanics, the power and weight are in the inverse ratio of their distances from the fulcrum. This is equally true for straight or bent levers; but (fig. 1, b), the distance of the

Fig. 1, b.

power and weight from the fulcrum is not, in all cases, the actual length of the arms, but the lengths of perpendiculars from the fulcrum upon the directions of the power and weight. This principle holds good, whatever be the relative positions of the power, weight, and fulcrum; and as there can be three different arrangements of these, we thus obtain what are called 'the three kinds of levers.' The first kind (fig. 2) is where the fulcrum is placed between the power and the weight; the Balance (q. v.), spade (when used for raising earth), see-saw, &c., are examples of this; and scissors and

Fig. 2.

Fig. 3.

pincers are examples of double-levers of the same kind. Levers of the second kind (fig. 3) are those in which the weight is between the power and fulcrum; examples of this are the crowbar, when used for pushing weights forward, the oar—the water being the fulcrum, and the row-lock the point of application of the weight—and the wheelbarrow; and of double-levers of this kind we have nut-crackers as an example. In levers of the

Fig. 4.

third kind (fig. 4), the power is between the weight and the fulcrum. Fishing-rods, whips, umbrellas, and most instruments used with the hand alone, are levers of the third kind, and shears, tongs, &c., are examples of double-levers of this class. It is evident that, to produce equilibrium in levers of the first kind, the power may, according to the ratio of the lengths of the arm, be either greater or less than the weight; in the second kind, it must always be less; and in the third kind, always greater. This is expressed in technical phrase by saying that the first kind of lever gives a mechanical advantage or disadvantage (see MECHANICAL POWERS), the second always gives a mechanical advantage, and the third always a mechanical disadvantage. Levers of the second kind, having the same mechanical advantage, are, when worked by man, twice as powerful as those of the first kind, because in the one case he uses his muscular force as the power, in the other case only his weight. Levers of the third kind are used when velocity, or a large extent of motion, is required at the expense of power, and we consequently find this form much used in the

structure of the limbs of animals. The structure of the human arm (fig. 5) is a very good example of this; the fulcrum is the socket (C) of the elbow joint, the power is the strong muscle (the biceps

Fig. 5.

which passes down the front of the Armurer, and is attached, at A, to the radius (see ARM); the weight is the weight of the forearm, together with anything held in the hand, the two being supposed to be combined into one weight acting at B. By the arrangement, a large extent of motion is gained, by a slight contraction or extension of the muscle.

When a large mechanical advantage is required, this may be obtained, without an inordinate lengthening of the lever, by means of a combination of them (as in fig. 6). Here the levers have their arms in the ratio of 3 to 1, and a little consideration will make it plain that a power (P) of 1 lb. will balance

Fig. 6.

a weight of 27 lbs.; but in this instance the particular defect of the lever as a mechanical power shows itself prominently; for if the weight has to be lifted two inches, the power requires to be depressed (2×27 or) 54 inches; and as the extent of sweep of the power cannot be largely increased without inconvenience, the advantages of this machine are confined within narrow limits.

LEVER, CHARLES, Irish novelist, was born in Dublin, 31st August 1806. He was educated for the medical profession, studying first at Trinity College, and afterwards on the continent. After taking his degree at Göttingen, he was attached (as physician) to the legation at Brussels, and, on his resignation of that post, became editor of the *Dublin University Magazine*. He opened his brilliant literary career by *Harry Lorrequer*; and since that period he has published a whole library of fiction, the larger proportion of which was issued in the serial form with illustrations. Among L.'s best novels may be specified *Charles O'Malley*, *Tom Burke*, *Roland Cashel*, *The Knight of Gwynne*, *The Dodd Family Abroad*, *Davenport Dunn*. When he undertook the editorship of the famous Irish magazine, L. fixed his residence in the neighbourhood of Dublin; but when, after a few years' trial, his work became distasteful, he removed to Florence, where he at present (1863) resides.

The earlier novels of L. are remarkable for a certain boisterous mirth and whirl of incident. His ladies and gentlemen seem under the influence

of champagne, his peasants and servant-men of 'potheen.' Latterly, the current of his genius has become broader and clearer, and several of his recent works, while they are not devoid of the early flash and outbreak, aim after something of a thoughtful interest, and an artistic development of character.

LEVERET, the young of the hare during the first year of its age.

LEVERRIER, URBAIN JEAN JOSEPH, a French astronomer of great celebrity, was born at St Lô, in the department of Manche, 11th March 1811. He was admitted into the Polytechnic in 1831, and was subsequently employed for some time as an engineer in connection with the Tobacco Board. In 1836, he published *Mémoires sur les Combinaisons du Phosphore avec l'Hydrogène et avec l'Oxygène*. His *Tables de Mercure*, and several memoirs on 'the secular inequalities,' opened to him the door of the Academy in 1846; and at the instigation of Arago, he applied himself to the examination of the disturbances in the motions of the planets, from which the existence of an undiscovered planet could be inferred; and as the result of his laborious calculations, directed the attention of astronomers to the point in the heavens where, a few days afterwards, the planet Neptune was actually discovered, the same thing being also, by a remarkable coincidence, done about the same time, and independently, by the English astronomer Adams (q. v.). For this L. was rewarded with the Grand Cross of the Legion of Honour, a professorship of astronomy in the Faculty of Sciences at Paris, and various minor honours. When the Revolution of 1848 broke out, L. sought distinction as a democratic politician; the department of La Manche chose him in May 1849 to be a member of the Legislative Assembly, where he at once became counter-revolutionary; and in 1852, Louis Napoleon made him a senator. After the death of Arago, an imperial decree of January 1854 conferred upon L. the directorship of the Observatory of Paris.

LEVI, the third son of Jacob and Leah (Gen. xlix. 34). He is conspicuous through the part he took with his brother Simeon in the wholesale slaughter of the inhabitants of Shihem, together with Hamor and Shechem their princes, while in a defenceless state, in order to avenge the wrong inflicted by the latter on Dinah. Jacob, even on his deathbed, could not forgive this, their bloody 'anger and self-will,' and pronounced this curse on them both, that they should be scattered among Israel (Gen. xlix. 7). How this was fulfilled in the case of Levi, whose descendants, singled out for the service of the sanctuary and the general instruction of the people, had to reside in cities set aside for them throughout the length and the breadth of the land, will be more fully shewn under LEVITES. In Egypt, the House of Levi had divided itself into three families, those of Gershom, Kehath, and Merari.

LEVYATHAN, a scriptural term for a great 'sea-monster,' but more especially a Crocodile (q. v.). In the Prophets and Psalms, it is occasionally used as a symbol of Egypt and Pharaoh. Many wondrous allegorical tales are connected with this word in the Talmud and Midrash.

LEVITA, ELIJAH (*Halvi, Ben Asher; Ashkenasi* = the German, *Habachur* = the Master, *Hamedak-dak* = the Grammarian), a Jewish grammarian and exegete, who, though much overrated, still holds a high rank among Hebrew scholars, was born at Neustadt on the Aisch, near Nuremberg, in 1470. One of the then frequent expulsions of the Jews forced him to seek refuge in Italy, where he held a high position as teacher of Hebrew, first in Venice,

next in Padua, finally in Rome (1514). Cardinal Egidio here became his patron and pupil, but even he could not prevent L.'s again being expelled this city, together with his Jewish brethren, in 1527. He then returned to Venice, where he lived for the most part until his death, 1549. His principal exegetical and biblical works are a *Commentary on Job in verse*, a *German Translation of the Psalms*, an *Edition of the Psalms with Kimchi's Commentary*, an *Edition of the Targum to Proverbs*, and of *Kimchi's Commentary to Amos*. His grammatical works are chiefly: *Masoreth Hammaseoreth* (Tradition of Traditions), a treatise on the vowel-points, &c., in the Old Testament; *Tub Taam* (Good Judgment), a treatise on Accents; *Sefer Habachur* or *Dikduk* (Grammar), besides many minor treatises. In the field of lexicography, he has contributed *Meurgeman* (= Dragoman), an attempt at a Talmudical and Targumical Dictionary; *Tishbi*, a complement to Hebrew dictionaries; *Shemoth Debarim* (The Names of Things), a Hebrew-German dictionary; *Nimukim*, glosses to David Kimchi's *Book of Hebrew Roots*, &c. Most of L.'s works have been repeatedly edited and partly translated by Buxtorf, Münster, Fagius, and others, who owed most of their Hebrew knowledge to L. exclusively: a fact not generally recognised.

LEVITES, the descendants of Levi (q. v.), who were singled out for the service of the sanctuary. The term is more particularly employed in contradistinction to Priests (q. v.), in designating all those members of the tribe who were not of the family of Aaron. It was their office—for which no further ordination was required in the case of the individual—to erect, to remove, and to carry the tabernacle and its utensils during the sojourn of the Israelites in the wilderness. When the sanctuary had found a fixed abode, they acted as its servants and guardians, and had to assist the priests in their holy functions in the sanctuary and in their medical capacity among the people. The vocal and instrumental music in the temple was likewise under their care, as were also the general instruction of the people, certain judicial and administrative functions, the keeping of the genealogical lists, and the propagation of the Book of the Law among the community. In order to enable them better to fulfil these functions, no special part of the land was allotted to them, but they were scattered—in accordance with Jacob's last words (Gen. xlix. 7)—in Israel; forty-eight Levitical cities, among which there were also certain 'cities of refuge,' being set aside for them on both sides of the Jordan; without, however, preventing their settling wherever else they pleased. Their revenues consisted of the annual Tithe (q. v.), and of a share in the second tithe, due every third year, and in the sacrificial repasts. The length of their service varied at different times. No special dress was prescribed for them until the time of Agrippa.

While in the desert not more than 8580 serviceable men strong, they had, under David, reached the number of 38,000 men fit for the service, 24,000 of whom this king selected, and divided them into four classes—sacerdotal assistants, doorkeepers, singers and musicians, and judges and officers. A very small number only returned from the exile, and all the Mosaic ordinances with respect to their cities, tithes, share in sacrificial repasts, &c., were virtually abrogated during the second temple. Nothing but the service in the temple, in which they were assisted by certain menials called *Nehaim*, was left to them. It may be presumed that they earned their livelihood partly like the rest of the community, partly as teachers, scribes, and

the like. Their travelling-garb consisted, according to the Talmud (Jebam., 122 a), of a staff, a pouch, and a Book of the Law. Foreign rulers also granted them exemption from taxes. This is the only tribe which is supposed to have kept up its pure lineage to this day, and certain, albeit small, signs of distinction are still bestowed upon its members, more especially in the case of the presumed descendants of Aaron (the *Kohanim*). But the purity of lineage is more than questionable in many instances.—*L.* is also the name given to certain sacerdotal assistants in the Romish Church.

LEVITICUS (Heb. *Vajikra*) is the name of the third book of the Pentateuch, containing chiefly the laws and ordinances relating to the Levites and priests. Little or no progress is made in it with respect to the history of the people, and the few events recorded are closely connected with the special aim and purport of the book. The erection of the sanctuary having been described at the end of Exodus, the nature of the worship—revealed by God within this tabernacle—is set forth in Leviticus, which forms its continuation. The order followed is not strictly systematical, but a certain plan is apparent, in its outlines at least.

The age and authorship of Leviticus will be considered, together with that of the other 'Mosaic' records, under PENTATEUCH. We shall confine ourselves to mentioning, in this place, that the whole of the supposed 'original' or Elohist document (see GENESIS) is by modern critics held to be embodied, in its primitive shape, as nearly as possible at least, in the 'Leviticus' as we have it now. Among the few additions and alterations ascribed to the Jehovist, are reckoned chapters x. 16—20, xx. 20—25, xxv. 18—22, and the greater part of chap. xxvi. (3—35), the second verse of which (end of *Parashah xxxii.*) is held to have concluded the Sinaitic legislation in the original document.

LEVY (Fr. *levée*), is the compulsory raising of a body of troops from any specified class in the community for purposes of general defence or offence. When a country is in danger of instant invasion, a *levée en masse* is sometimes made—i. e., every man capable of bearing arms is required to contribute in person towards the common defence. On less urgent occasions, the levy may be restricted to a class, as to men between eighteen and forty years of age. At other times, a levy of so many thousand men of a certain age is decreed, and the districts concerned draw them by lot from among their eligible male population. In armies sustained by volunteering, the levy, which is a remnant of barbarous times, is unnecessary; but the system was frequently resorted to in France before the enactment of the conscription laws: 1862 has shewn great levies in the United States of America; and in any country where great danger is apparent, and volunteers are not sufficiently numerous, recourse must at all times be had to a levy of the people.

LEWES, the county-town of Sussex, market-town, and parliamentary borough of England, most picturesquely situated on the navigable river Ouse, 50 miles south from London, and 7 from Newhaven, which is its port. *L.* has a population of 10,116, and is the seat of the assizes. It returns two members to parliament, and is the seat of election for East Sussex. Fairs are held here on Whit-Tuesday and 6th May for horses; on the 20th July, for wool; and on 21st and 28th September, for South-down sheep, of which from 40,000 to 50,000 are often collected. The chief trade is in grain, sheep, and cattle. There are three iron foundries; and ship-building, brewing, tanning, rope-making, and lime-burning, employ many of the inhabitants.

Races are held here annually in July or August, near Mount Harry, on the Downs, where the celebrated battle of Lewes was fought, between Henry III. and the insurgent barons of the kingdom, on the 14th May 1264. The castle, the principal tower of which now forms the museum of the Sussex Archaeological Society, was long the seat of William de Warrenne, whose remains and those of his wife, Gundrada, daughter of the Conqueror, were discovered here. *L.* is of very remote origin, and was the site of a Roman station or camp. Three papers are here published, and the town is governed by two high-constables.

LEWES, GEORGE HENRY, a versatile English author of the present day, was born in London, April 18, 1819, educated at various schools, studied medicine for some time, and finally resolved to devote himself to authorship. In his twenty-first year, he proceeded to Germany, where he remained for two years, studying the life, language, and literature of that country. On his return to England, he took up his residence in London, and has ever since been one of the most industrious as well as successful of *littérateurs*. An intellect clear and sharp, if not remarkably strong; a wit lively and piquant, if not very rich; sympathies warm, if not wide; and a style as firm as it is graceful, have made *L.* one of the best of critics and biographers. He has contributed to most of the quarterlies and magazines of the day; edited (with admirable talent) the *Leader* newspaper from 1849 to 1854; composed novels, comedies, and tragedies; and, of late years, has turned his active mind to the study of physiology and cognate branches of science, in which he has won as high a reputation as in the lighter departments of literature. His principal works are his *Biographical History of Philosophy* (1845, a new edition of which, much enlarged, has since been published); *The Spanish Drama, Lope de Vega and Calderon* (1846); *Comte's Philosophy of the Sciences* (forming one of the volumes in Bohn's *Scientific Library*, 1853), a work which is not a mere translation of the French savant, but in several parts a complete remodelling, by which the style at least does not suffer; *Life and Works of Goethe, &c.* (1855), probably his most valuable performance, and indisputably the best work on the subject; *Seaside Studies at Ilfracombe* (1858); and *Physiology of Common Life* (1860). He is understood to be engaged at present (1863) on an edition of the works of Spinoza.

LEWIS, or SNAKE RIVER, the great southern branch of Columbia River, United States of America, rises in the Rocky Mountains, on the western borders of Nebraska Territory, and after a circuitous course, the general direction is north-west, through Oregon Territory, it joins the Columbia, near Fort Walla-Walla, lat. 46° 6' N., long. 118° 40' W. Length, 900 miles.

LEWIS, RIGHT HON. SIR GEORGE CORNEWALL BARR, English statesman and author, was born in London 1806. He was eldest son of Sir Thomas Frankland Lewis, first baronet, of Harpton Court, Radnorshire, who, after a long official career, was chairman of the Poor-law Board from 1834 to 1839. *L.* was educated at Eton and Christ-church, Oxford, where, in 1828, he was first-class in classics, and second-class in mathematics. He was called to the bar of the Middle Temple in 1831, and after acting on various commissions of inquiry, succeeded his father as Poor-law Commissioner in 1839, and remained at the Poor-law Board until it was broken up and reconstituted in 1847. He had meanwhile married Lady Maria Theresa, sister to the fourth Earl of Clarendon, and a connection by marriage of Earl Russell.

Having determined to adopt a political career, and being thus incorporated into the number of Whig official families, his promotion was certain and rapid. He sat for Herefordshire from 1847 to 1852, and became successively Secretary to the Indian Board of Control, Under-secretary for the Home Department, and Financial Secretary to the Treasury. In 1852, he lost his seat in the House of Commons, and subsequently accepted the editorship of the *Edinburgh Review*, which he continued to conduct until 1855, when he was elected for the Radnor district of boroughs. He had scarcely taken his seat when Lord Palmerston offered him the Chancellorship of the Exchequer in his first administration, which he held from March 1855 to the dissolution of the government in February 1858. On the return of Lord Palmerston to power, in June 1859, L. accepted the post of Secretary of State for the Home Department, which, to the surprise of the nation, he exchanged, in 1861, on the death of Lord Herbert, for the office of Secretary of State for War. In the same year, he published a work of much research, entitled the *Astronomy of the Ancients*. This unremitting labour weakened his frame, and a cold caught while he was enjoying the Easter holidays at his family seat, was followed by congestion of the lungs, which proved fatal, April 13, 1863. L. was an able, earnest, and sincere politician. As an orator, he could scarcely be said to express himself with eloquence or vivacity; yet his sound sense, varied knowledge, and moral and intellectual qualities, made him one of the chief ornaments of public and political life in England. His *Inquiry into the Credibility of Early Roman History*, is conducted on the critical principles of Niebuhr, but is more rigorous and sceptical in spirit than the work of the great German historian. The treasures of varied knowledge and wisdom which he had collected during his comparatively short life, may be gathered from a list of his works, which include a treatise on the *Origin and Formation of the Romance Language*, *The Fables of Bædrius*, *The Use and Abuse of Political Terms*, *The Influence of Authority in Matters of Opinion*, *The Method of Observation and Reasoning in Politics*, *Local Disturbances and the Irish Church Question*, *The Government of Dependencies*, *A Glossary of Provincial Words used in Herefordshire*, and the *Astronomy of the Ancients*. His latest work was a *Dialogue on the Best Form of Government*, which was published a few days before his death.

LEWIS-WITH-HARRIS (the name Lewis is derived from the Norwegian *Ljóðhus*, the sounding house), an island of Scotland, one of the Outer Hebrides, the most northern and the largest of the group, lies about 30 miles north-west from Ross-shire, from which it is separated by the Minch (q.v.). Lewis, the larger and most northerly part of the island, belongs to Ross-shire; the other portion, Harris, belongs to Inverness-shire. Entire length, 60 miles; greatest breadth, 30 miles. Area, 770 square miles; pop. (1861) 23,666. The coasts are wild and rugged; the chief indentations being Broad Bay, Lochs Erisort, Seaforth, Resort, and Roag. The Butt of Lewis, a promontory at the extreme north, in lat. 58° 31' N., long. 6° 15' 30" W., rises 142 feet above sea-level. The surface is rugged, with tracts of swamp, a considerable portion is covered with peat, and there are remains of ancient forests. Barley and potatoes are the principal crops raised. Remains of ancient edifices abound on the island. The inhabitants are almost all of Celtic extraction, with the exception of a colony in the north, who, although they speak the Gaelic language, are of purely Scandinavian descent. Stornoway, on the east coast, is the principal town. Near it is Storno-

way Castle, the seat of Sir James Matheson, Bart., who, as proprietor of Lewis, has expended large sums in various kinds of improvements. Stornoway is visited by steamers from Glasgow. See **HEBRIDES**.

LEWISIA, a genus of plants, of the natural order *Portulacaceæ* (see **PURSLANE**), named in honour of the American traveller Lewis. *L. rediviva* is found in the regions of his explorations, on the west side of the Rocky Mountains. Its roots are gathered in great quantities by the Indians, and are highly valued as nutritive, and also as restorative, a very small quantity being deemed sufficient to sustain a man throughout a long journey and much fatigue. It is called *Tobacco Root* because, when cooked, it has a tobacco-like smell.

LEWISTOWN, a town of Maine, United States of America, on the Androscoggin River, 33 miles north of Portland. The river has here a fall of 50 feet in 200, and the water-power is distributed by a dam and canal to 7 manufacturing companies, and several large saw-mills, &c. There are 8 churches, 4 newspapers, and a Baptist seminary. Pop. 7000.

LEX FORI, a legal expression often used to denote the law of the country where a suitor brings his action or suit. See **INTERNATIONAL LAW**.

LEX LOCI, a legal expression to denote the law of the country where a particular act was done, or where land is situated. See **INTERNATIONAL LAW**.

LEX NON SCRIPTA, the unwritten law, an expression often applied to the common law, or immemorial custom.

LEX TALIONIS, the law of retaliation, common among all barbarous nations, by which an eye for an eye, and a tooth for a tooth, was considered the appropriate punishment. The doctrine is repudiated by all civilised countries.

LEXICON. See **DICTIONARY**.

LEXINGTON, a small village of Massachusetts, United States of America, 10 miles north-west of Boston, celebrated as the scene of the first conflict between the colonists and British troops in the War of Independence, April 18, 1775. Pop. 2000.

LEXINGTON, a city of Kentucky, United States of America, on the Town Fork of the Elkhorn, a tributary of Kentucky River, 77 miles east of Louisville. It is a handsome city, surrounded by a country of great beauty and fertility. Its principal edifices are a Court-house, Transylvania University, State Lunatic Asylum, City Hospital, Orphan Asylum, banks, 12 churches. There are 2 newspapers, 80 manufacturing establishments, mostly of hemp and tobacco. The town was being laid out when news arrived of the skirmish at Lexington, 1775, when the name was adopted. It has a beautiful cemetery, with a handsome monument to Henry Clay. Pop. (1860) 9321.

LEXINGTON, a town of Missouri, United States of America, on the right bank of the Missouri River, 350 miles above St. Louis. It has 7 churches, 2 newspapers, a branch of the Bank of Missouri. It has been the scene of repeated conflicts during the present War of Secession. Pop. (1860) 4115.

LEYDEN (Fr. *Leyde*, the *Lugdunum Batavorum* of the Romans, originally *Luijkduin*, from *luijk*, an end, and *dun*, a hill; during the middle ages, *Lugdun* or *Leydis*), a celebrated seat of learning in Holland, situated on the Old Rhine, 22 miles south-west of Amsterdam, and 17 north of Rotterdam. Pop. 37,339. It is said to be the oldest town in Holland, and has space for three times its present population. In 1640, L. contained 100,000 souls; in 1750, the numbers had fallen to 70,000; and at the

beginning of the present century, to 30,000. Since 1830, trade has again begun to flourish, and the population to increase. The streets are wide, the public buildings beautiful, and the canals broad and numerous. Within the city are the ruins of an old castle, called the 'Burg,' supposed to have been built by the Romans before the birth of Christ. The principal manufactures are linen cloths, calicoes, woollens, but on a very small scale, as compared with former times. There is a considerable weekly market, for the whole of that part of Holland called Rhineland, held at L., at which much butter and cheese change hands. But the chief ornament and glory of the city is its university—once unsurpassed by any in Europe. The origin of the university is well known. In 1574, when Holland was struggling to throw off the yoke of Spain, L. was besieged by the Spaniards, and had to endure all the horrors of famine. For seven weeks the citizens had no bread to eat, and multitudes perished of hunger. The heroic burgomaster, Pieter Adriaanszoon Van der Werff, even offered his body as food to some who were imploring him to capitulate. At last, the Prince of Orange broke down the dykes, flooded the country, drowned a great number of the Spaniards, and relieved the inhabitants. The Prince of Orange now offered, as some compensation for their unparalleled sufferings, either to remit certain taxes or to establish a university in the city. The Leydeners nobly chose the latter, which was inaugurated by Prince William in 1575. Many eminent men, from all countries of Europe, have been connected with it, both as professors and students. We may mention Scaliger, Gomarus, Arminius, Grotius, Descartes, Boerhaave, Camper, Spanheim, Rhunkens. At present, it has 27 ordinary professors and 1 extraordinary. In 1862, the students were 487—being, law, 259; theology, 100; medicine, 82; other classes, 46. It also possesses a valuable library, with many rare MSS.; a magnificent collection in medicine; a botanical garden, valuable for its tropical plants; a museum of natural history, one of the richest in Europe; and another equally fine of comparative anatomy. The Museum of Antiquities is also excellent. On the 12th January 1807, the most beautiful quarter of the city was destroyed, and many lives lost, by the explosion of a ship's cargo of gunpowder, and the site of the ruined streets is now a plain on which the troops are exercised.

LEYDEN, LUCAS VAN, one of the most celebrated painters of the early Dutch school, was born in Leyden in 1494. His talents, which were developed when he was very young, were first cultivated by his father, Hugo Jacobs, an obscure painter; but he was afterwards placed in the school of Cornelius Engelbrecht, an artist of repute in his day. He commenced engraving when scarcely nine years of age. His picture of St. Hubert, painted when he was only twelve, brought him very high commendation; and the celebrated print, so well known to collectors by the name of 'Mahomet and the Monk Sergius,' was published in 1508, when he was only fourteen. He practised successfully almost every branch of painting, was one of the ablest of those early painters who engraved their own works, and he succeeded, like Albert Dürer, in imparting certain qualities of delicacy and finish to his engravings that no mere engraver ever attained. The pictures of Lucas van L. are noted for clearness and delicacy in colour, variety of character and expression; but his drawing is hard and Gothic in form. Examples are to be seen in many of the galleries on the continent. His range of subjects was very wide, and embraced events in sacred history, incidents illustrative of the manners of his own period, and portraits. His engravings

are very highly prized by collectors, and are ranked about as highly as those of Albert Dürer. He also executed some wood-cuts, which are very rare. Bartsch gives a list of 174 engravings by him. His habits were expensive. He seems to have occasionally entertained his brother-artists in a sumptuous manner; was on terms of intimacy with the celebrated painter, Jean de Mabuse, who is alleged to have been rather too fond of good living; and held friendly intercourse with Albert Dürer, whose talents he admired without professional jealousy. He married in early life a lady of the noble family of Boeshagen, by whom he had one daughter. He died in 1533, aged 39. He had been confined to bed six years before his death, but contrived to paint and engrave till within a short period of his decease.

LEYDEN JAR. See ELECTRICITY.

LEVEE MAJESTY, an offence against sovereign power—*læsa majestas*.

LIABILITY (LIMITED) ACTS. See JOINT-STOCK COMPANIES.

LIANAS, a term first used in the French colonies, but afterwards adopted by English, German, and other travellers, to designate the woody, climbing, and twining plants which abound in tropical forests, and constitute a remarkable and ever-varying feature of the scene. Such plants are comparatively rare in colder climates, although the honeysuckles and some species of *Clematis* afford

Lianas.

familiar examples of them; but as these often overtop the hedges or bushes in which they grow, and fall down again by the weight of their leaves as their stems elongate, so the L. of tropical countries overtop the tallest trees, descend again to the ground in vast festoons, pass from one tree to another, and bind the whole forest together in a maze of living network, and often by cables as thick as those of a man-of-war. Many parts of the forest—as in the alluvial regions of the Amazon and Orinoco—thus become impenetrable without the aid of the hatchet, and the beasts which inhabit them either pass through narrow covered paths, kept open by continual use, or from bough to bough far above the ground. Many L.—as some of the species of *Wrightia*—become tree-like in the thickness

of their stems, and often kill by constriction the trees which originally supported them; and when these have decayed, the convolutions of the L. exhibit a wonderful mass of confusion magnificent in the luxuriance of foliage and flowers. No tropical flowers excel in splendour those of some lianas. Among them are found also some valuable medicinal plants, as sarsaparilla. The rattans and vanilla are lianas. Botanically considered, L. belong to natural orders the most different. Tropical plants of this description are seldom to be seen in our hothouses, owing to the difficulty of their cultivation.

LIAS. The lias is the lower division of the Cretaceous or Jurassic Period (q.v.). The beds composing it may be considered as the argillaceous basis of that series of rocks, consisting of more than a thousand feet of alternations of clay and limestone, with but a few unimportant deposits of sand. It consists of the following groups:

UPPER LIAS	Cephalopoda bed.	
	Lias sands.	300 feet.
MARLSTONE,	Upper shale.	200 "
	Lower shale.	600 "
LOWER LIAS	Bone bed,	

The Upper Lias consists of thin limestone beds scattered through a great thickness of blue clay, more or less indurated, and so aluminous that it has been wrought for alum at Whitby. A thick band of vegetable matter or impure lignite occurs in this division, in which are found nodules and lumps of jet, a peculiar mineral composed of carbon and hydrogen, and probably having a similar origin to the amber of the tertiary lignites. A series of brown and yellow sands, and a peculiar layer called the cephalopoda bed, from the abundance of these fossils contained in it, occur above these clays; recently, they have been separated from the inferior oolite, and joined to this division, on the evidence of the contained fossils.

The Marlstone is an arenaceous deposit, bound together either by a calcareous or ferruginous cement, in the one case passing into a coarse shelly limestone, and in the other into an ironstone, which has been extensively wrought both in the north and south of England.

The Lower Lias beds consist of an extensive thickness of blue clays, intermingled with layers of argillaceous limestone. In weathering, the thin beds of blue or gray limestone become light brown; while the inter-stratified shales retain their dark colour, giving the quarries of this rock, at a distance, a striped or ribbon-like appearance, whence, it is supposed, the miner's name lias or layers is derived. Generally, the clays rest on triassic rocks, but occasionally there is interposed a thin bed of limestone, containing fragments of the bones and teeth of reptiles and fish, generally of undoubted liassic age; occasionally, the bones of keuper reptiles are met with in it, causing it to have been referred to the Trias.

The Lias is highly fossiliferous, the contained organisms being well preserved; the fishes are often so perfect as to exhibit the complete form of the animal, with the fins and scales in their natural position. Numerous remains of plants occur in the lignite and in the shales. The name Gryphite Limestone has been given to the Lias, from the great quantities of *Gryphaea incurvata*, a kind of oyster, found in it. Some of the older genera of mollusca are still found in these beds, but the general character of these animals more nearly approaches the newer secondary forms. Fish-remains are frequently met with; the reptiles, however, are the most striking features. They are remarkable for the great numbers in which they

occur, for the size which many of the species attain, and for the adaptations in their structure which fitted them to live in water. The most noteworthy are species of *Ichthyosaurus* (q.v.) and *Plesiosaurus* (q.v.).

The Liassic rocks extend in a belt of varying breadth across England, from Whitby, on the coast of Yorkshire, south to Leicester, then south-east by Gloucester to Lyme Regis in Dorsetshire.

LIBANIUS, one of the latest and most eminent of the Greek sophists or rhetoricians, was born at Antioch, in Syria, about 314 or 316 A.D. He studied at Athens under various teachers, and first set up a school in Constantinople, where his prelections were so attractive that he emptied the benches of the other teachers of rhetoric, who had him brought before the prefect of the city on a charge of 'magic,' and expelled. He then proceeded to Nicomedia; but after a residence of five years, was forced by intrigues to leave it, and returned to Constantinople. Here, however, his adversaries were in the ascendant; and after several vicissitudes, the old sophist, broken in health and spirit, settled down in his native city of Antioch, where he died about 393 A.D. L. was the instructor of St Chrysostom and St Basil, who always remained his friends, though L. was himself a pagan. He was a great friend of the Emperor Julian, who corresponded with him. His works are numerous, and mostly extant, and consist of orations, declamations, narratives, letters, &c. The most complete edition of the orations and declamations is that by Reiske (4 vols. Altenb. and Leip. 1791—1797), and of the letters that by Wolf (Amst. 1738).

LIBANON. See **LEBANON**.

LIBATION (Lat. *libare*, to pour out), literally, anything poured out before the gods as an act of homage or worship; a drink-offering. The term was often extended in signification, however, to the whole offering of which this formed a part, and in which not only a little wine was poured upon the altar, but a small cake was laid upon it. This custom prevailed even in the houses of the Romans, who at their meals made an offering to the Lares in the fire which burned upon the hearth. The libation was thus a sort of heathen 'grace before meat.'

LIBAU, a seaport of Courland, Russia, on the Baltic, 526 miles south-west of St Petersburg. It existed previous to the settlement here of the Teutonic Knights, who surrounded the town with walls, and erected in 1300 a cathedral and a castle. In 1795, it was annexed to Russia. The port, with a secure harbour 14 feet deep, is open almost the whole year. Its inhabitants, since the 17th c., have devoted themselves to ship-building, and now furnish merchant-vessels to St Petersburg, Riga, and Revel. In 1861, 239 ships entered, and 145 cleared the port. The imports, amounting in value to 1,673,866 rubles, consist of salt herrings, wines, fruit, and colonial produce; the exports (1,739,802 rubles in value) are chiefly cereals, leather, flax, seeds, and timber. Pop. 10,126.

LIBEL, in Scotch Law and in English Ecclesiastical Law, means the summons or similar writ commencing a suit, and containing the plaintiff's allegations.

LIBEL is a publication either in writing, print, or by way of a picture, or the like, the tendency of which is to degrade a man in the opinion of his neighbours, or to make him ridiculous. When similar results follow from words spoken, the act is called Slander (q.v.), which, however, is less severely punished. It is extremely difficult to

define what amounts to libellous matter, for the question whether a publication amounts to libel must always be left to the decision of a jury, and this decision is somewhat uncertain, and varies with the popular mood for the time. But the test is, in point of law, whether there results degradation of character. There are two remedies in England for the wrong caused by libel; one is by indictment, the other is by action. If the offence is of a public nature, an indictment is generally resorted to, for every libel tends to a breach of the peace; or the libelled party applies to the Court of Queen's Bench for a criminal information, which is a variety of indictment. When an action is brought, its object is to recover damages for the private injury sustained. The rule formerly was, in indictments and criminal informations, that the defendant was not allowed to plead in defence that the libellous matter was true. But the law was in 1843 altered, and the defendant is now allowed, by way of defence, to allege the truth of what was charged, and further that it was for the public benefit that the matter should be published, stating how. If, however, the jury by their verdict find otherwise, this defence often aggravates the punishment. The statute 6 and 7 Vict. c. 96 also improved the law of libel as regards editors, and proprietors of newspapers, and periodical publications, who were formerly held liable for libels inserted without their knowledge. By the present law, the defendant may plead in defence that the article in question was inserted without actual malice and without gross negligence, and that, before the commencement of the action, or at the earliest opportunity afterwards, the defendant inserted an apology, or if the periodical did not appear within an interval of a week, that he offered to publish an apology in any newspaper or periodical to be selected by the plaintiff. But the defendant, when he pleads this defence, must also pay into court a sum of money, by way of amends for the injury done. In these cases, even where the proceeding is by indictment or criminal information, the defendant, if he obtains a verdict, will (contrary to the general rule) be entitled to have his costs paid by the prosecutor. There are certain libels which are called blasphemous on account of their denying the fundamental truths of Christianity, and these are punishable by fine and imprisonment. So there are seditious, treasonable, and immoral libels, according to the nature of the subject-matter. If any person threaten to publish a libel, or offer to prevent such publication, with intent to extort any money, security, or valuable thing, or with intent to induce any person to confer or procure any appointment or office of profit or trust, he is liable to imprisonment with or without hard labour for three years. If any person maliciously publish a defamatory libel, knowing the same to be false, he is liable to two years' imprisonment and a fine; and the malicious publication, even though not with knowledge that it is false, makes the author liable to one year's imprisonment and a fine.

LIBELLULA and **LIBELLULIDÆ**. See **DRAGON-FLY**.

LIBER. See **RARE** and **RASH**.

LIBERATION, in Scotch Law, means discharge from imprisonment. Formerly, if a person was imprisoned for debt, and paid the amount, he had to present a bill of liberation and suspension to get out of prison, which is not now necessary.

• **LIBERIA**, a negro republic on the Grain Coast of Upper Guinea. The territory of the republic extends from long. 5° 54' to 13° 22' W. The length of coast is about 300 miles, the average breadth of

the territory about 50 miles. On December 31, 1816, an association, of which Henry Clay (q.v.) was president, styled the American Colonisation Society, was formed, for the purpose of founding a colony of emancipated negroes, and of giving them favourable opportunities of self-improvement. The first attempt failed, in consequence of the selection of an unhealthy locality; but in December 1821, a treaty was concluded with the native princes, by which a tract of land fit for the purpose was acquired. The association immediately commenced operations, and allotted to each man 30 acres of land, with the means of cultivating it. A town, called Monrovia, was founded at Cape Mesurado; the boundaries of the colony were enlarged by the purchase of new tracts; and a second town, called Caldwell, in honour of the originator of the association, was founded upon the river Mesurado. New settlements were afterwards formed at Cape Mont. and in the newly acquired Bassa Land, in which, in 1834, a town was founded, and called Edina, in acknowledgment of pecuniary aid sent to the colony from Edinburgh. Many of the neighbouring chiefs were received into the colony, whilst others were subdued. In 1847, L. was left to its own resources, declared an independent republic, and the government committed to a president, senate, and house of representatives. The president and representatives are elected for two, and the senators for four years, all citizens being qualified electors when they reach 21 years of age, and possess real estate. The judicial power is vested in one supreme and several subordinate courts. Slavery and the slave-trade are prohibited, and the right of petition established. Whites are excluded from rights of citizenship, but this is only a temporary measure. The prosperity of the colony soon became very obvious; churches and schools were founded in greater proportion to the population than in most parts of Britain or America; a regular postal system was established, newspapers published, and slavery in the neighbouring states abolished. Negroes from the neighbouring regions, settling in the republic and submitting to its laws, were admitted to participation in civil and political freedom equally with the colonists. The new republic was recognised by Britain in 1848, and since by other European powers. The British government made it a present of a corvette of war with four guns. The prosperity and usefulness of L. have since continued to increase, but the number of settlers from North America has never been great in any year, and up to 1856, the whole number in the country was reckoned not to exceed 10,000. Additional negro tribes are, however, from time to time included within its territory. In 1850, the native inhabitants of L. were estimated at 300,000; and about 50,000 had acquired the English language, of whom about 3000 were members of the Christian church. Agriculture is carried on, but, as yet, without much success. Coffee is a principal article of produce. Cocoa, cotton, the sugarcane (1856), arrow-root, and rice are also cultivated. Trade is rapidly extending, and palm-oil, ivory, gold-dust, camwood, wax, coffee, indigo, ginger, arrow-root, and hides, are amongst the principal articles of export. In 1860, a cargo of sugar was sent to New York, and this is the only manufacture yet prosecuted. Consult Bowen's *Central Africa* (New York, 1857), and Thomas's *West Coast of Africa* (New York, 1860).

LIBERIUS, a native of Rome, born in the early part of the 4th c., succeeded to the see of Rome in 352, on the death of Pope Julius I. His pontificate falls upon the stormiest period of the semi-Arian controversy. See **ARIUS**. The Emperor

Constantius supported the semi-Arian party with all his authority; and the council of Arles in 353, and that of Milan in 355, formally condemned Athanasius (q.v.), the great representative of the orthodox belief. L. refused to confirm this decree, and, even in opposition to the personal commands of Constantius, withheld his subscription. He was, in consequence, in common with several others, deposed and banished to Berea by the emperor, who caused a Roman deacon, Felix, to be elected in his stead. The later history of L. is a subject of controversy. He was restored to his see in 358, but the terms on which he was recalled are much disputed. He survived his return from exile eight years, and died in high repute for sanctity at Rome in 366. His only remains are some letters preserved by Constant in the *Epistolæ Romanorum Pontificum*. During his life, many spurious letters and decrees were circulated in his name.

LIBERTY, in English Law, is often used to denote a franchise, or portion of the royal prerogative delegated to a subject; also a privileged district in a county exempt from the sheriff's jurisdiction.

LIBERTY, EQUALITY, FRATERNITY. For nearly a century, these three words have been accepted as embodying the creed of those who maintain the rightful supremacy of the numerical majority; and they have been sounded as the watchword of that formidable movement known on the continent of Europe as 'the Revolution,' of which the object is to assert this supremacy by overturning the existing fabric of society. When contrasted with the democratic creed of antiquity, the only novelty which the modern symbol exhibits consists in the proclamation of 'equality;' for 'liberty,' in the widest sense—meaning thereby the ultimate extension of political power to the whole body of the citizens—has been the object of the most enlightened politicians of all ages; whilst the protest in favour of 'fraternity' is a mere sentimental commonplace, about the speculative soundness of which there never was any real difference of opinion.

The first state document of importance in which the doctrine of equality is set forth is the American Declaration of Independence of July 4, 1776. This celebrated document proceeds thus: 'We hold these truths to be self-evident: *that all men are created equal*; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness, &c.' This, as we have said, was in 1776. But as a speculative opinion, the doctrine of equality had been proclaimed by Hobbes more than a century before, and from his time down to the period at which it thus received practical recognition, it had never been lost sight of by the class of speculators to which Hobbes belonged. Under different forms, and from various points of view, it had been reasserted by Spinoza, Rousseau, Helvetius, and ultimately by the class of political declaimers whose works were simultaneous with the American, and immediately preceded the French Revolution.

Hobbes was bolder than his followers, and by assuming a premise which, had it been true, would certainly have justified his conclusion, saved his logic, though he did not secure a very stable foundation for his law. He asserted that men are not only born, but continue in essentials very nearly equal. 'Nature,' he said, 'has made little odds among men of mature age as to strength and knowledge. Rousseau, on the other hand, feeling that subjective and objective experience would at once repudiate such an assumption, admitted the existence of inequalities in maturity, and scarcely ventured to

deny them even at birth, but ascribed them mainly to education, and to other distorting and deranging principles in human nature and human society, which it is the object of law and government to counteract. A third class of reasoners, whilst admitting the fact of inequality, and not condemning it as abnormal in the case of individuals, asserted that the argument in support of social and political equality is sufficiently founded on the generic equality of mankind—on the proposition, viz., that *all men are equally men*. They forgot, or found it convenient to ignore, that the argument of their opponents rested on the proposition, that *all men are not equal men*; and consequently would not have been in the slightest degree affected even by the admission of the generic equality for which they contended. To this last class belongs Professor Ahrens, whose work on Natural Law is at present used as the text-book in the *École de Droit* in Paris. But all these writers agree in maintaining the inalienable connection between equality and liberty; and in asserting that the realisation of the latter must of necessity be in proportion to the completeness with which the former is realised. In Great Britain, hitherto, the opposite creed has prevailed. Experience, both subjective and objective, has led to the conclusion that in point of fact men come into the world and continue during the whole course of their earthly sojourn to be extremely unequal in strength, intelligence, virtue, and worth. It is on this assumption that the whole fabric of our liberties rests. So far from believing liberty to involve the fictitious recognition of an equality which does not exist, or the creation of an equality which is contrary to nature, we hold it to necessitate the recognition of the inequalities which nature has established, and which God as the author of nature has decreed. Nay, further, we conceive its perfection to be in direct proportion to the completeness with which these inequalities are recognised, and their consequences, in the shape of property, social position, and the like, are vindicated by the political machinery of the state. Society, in our view of the matter, is an organic structure, is cosmic, just in so far as it recognises these inequalities; and begins to be inorganic, chaotic, the moment that it ignores them. In like manner, the political, which is the mirror of the social organisation of the state, performs its appropriate function only when, and in so far as it truly reflects the inequalities which society has recognised and sanctioned. It must neither add to nor take from the facts which society presents to it. To each it must assign his own, and nothing but his own; and his *own* politically is the place which society has already conceded to him. These views, which in a somewhat irregular manner have always been recognised and acted upon in England, have been thought out and systematised within these last few years by Mr Mill and the class of politicians to whom in future the title of Progressive Conservatives will probably be applied. By no writer, perhaps, has the true doctrine been stated with greater force than by John Adams, the friend and successor of Washington, and second president of the United States. The following passage is selected from many to the like effect in the recent edition of his works by his grandson, Charles Francis Adams: 'That all men are born to equal rights, is true. Every being has a right to his own as clear, as moral, as sacred, as any other being has. This is as indubitable as a moral government in the universe. But to teach that all men are born with equal powers and faculties, to equal influence in society, to equal property and advantages through life, is as gross a fraud, as glaring an imposition on the credulity of the people, as ever

was practised by monks, by Druids, by Brahmins, by priests of the immortal Lama, or by the self-styled philosophers of the French Revolution. For honour's sake, Mr Taylor, for truth and virtue's sake, let American philosophers and politicians despise it.'—(Vol. vi. p. 464.)

LIBERTY OF THE PRESS. See **PRESS**, **LIBERTY OF**; **LIBEL**.

LIBERTY OF THE SUBJECT is a general phrase descriptive of the right of the individual subject to do all things not specially prohibited by the law, and the less restriction there is by the law, the greater is the extent of the liberty enjoyed. In its widest sense, the phrase may be understood as comprising the whole of the rights allowed by law to the subject; but what is generally understood is the liberty of the person, or of rights connected with the person—such as personal liberty or freedom from slavery, the right of free speech, liberty of conscience, liberty of the press, and constitutional liberty, or the liberty to influence and take part in legislation, which may be further subdivided into the limitation of the royal prerogative, the powers and privileges of parliament, the right of applying to courts of law for redress of injuries, the right of petitioning the crown or parliament, the right of having arms for defence, the right of habeas corpus, &c. All these subjects are noticed in detail under their proper heads.

LIBIDINE. See **DIVIDINE**.

LIBOURNE, a handsome town of France, in the department of Gironde, on the right bank of the Dordogne, at its confluence with the Isle, 20 miles north-east of Bordeaux. It is one of the ancient *Bastides* or Free Towns, and was founded by Edward I, king of England, in 1286. It carries on considerable trade in wines, spirits, grain, salt, and timber. Cotton-yarn, iron, leather, ropes, and nails are manufactured. Pop. 13,290.

LI'RA, the seventh sign in the zodiac. At the first point of Libra, the ecliptic passes across the equator to the southern hemisphere, this point being thus the *autumnal equinox*.

LIBRARIES. The term library is applied indifferently to buildings, &c., destined to contain books, and to the books themselves deposited in these buildings. In the present article, it is used chiefly, if not exclusively, in the latter sense.

Passing over the 'libraries of clay,' as the collections of inscribed bricks and tiles of the Assyrians and Babylonians have been aptly designated, the first library, properly so called, of which we have any knowledge, is that which, according to Diodorus Siculus, was formed by the Egyptian king Osymandyses. The existence of this establishment, with its appropriate inscription, *Psyches iatreion*—the storehouse of medicine for the mind—was long regarded as fabulous; but the researches of Champollion, Wilkinson, and other modern investigators, go far to prove that the account of Diodorus, though perhaps exaggerated, is at least based upon truth. A more celebrated Egyptian library was that founded at Alexandria by Ptolemy Soter, for an account of which see **ALEXANDRIAN LIBRARY**. The library of Pergamus, a formidable rival to that of Alexandria, was founded probably by Attalus I., and was largely increased by the fostering care of his successors. As stated in the article just referred to, it was ultimately removed to Alexandria, being sent by Antony as a gift to Cleopatra. At the time that this transference took place, it contained, according to Plutarch, 200,000 volumes.

The first public library established at Athens is said to have been founded by Pisistratus; but the

information we possess regarding this and other Grecian libraries is meagre and unsatisfactory. The earliest Roman libraries were those collected by Lucullus and by Asinius Pollio. The latter was a public library, in the fullest sense; and the former, though private property, was administered with so much liberality as to place it nearly on the same footing. Various other libraries were founded at Rome by Augustus and his successors; the most important, perhaps, being the Ulpian Library of the Emperor Trajan. The private collections of Emilius Paulus, Sulla, Lucullus (already mentioned), and Cicero, are well known to every student of the classics.

The downfall first of the Western, and subsequently of the Eastern Empire, involved the destruction or dispersion of these ancient libraries. The warlike hordes by whom these once mighty monarchies were overthrown, had neither time nor inclination for the cultivation of letters; but even in the darkest of the dark ages, the lamp of learning continued to shine, if with a feeble, yet still with a steady light. Within the sheltering walls of the monasteries, the books which had escaped destruction, the salvage, if we may so express it, of the general wreck, found a safe asylum; and not only were they carefully preserved, but so multiplied by the industry of the transcriber, as to be placed beyond all risk of loss for the future. Amongst the conventual libraries of the middle ages specially worthy of notice are those of Christ Church, and of the monastery of St Augustine, Canterbury; of the abbey of Fleury and Clugny, in France; of Monte Cassino, in Italy; and of St Gall, in Switzerland. Private collectors, too, existed then as now, though, of course, their number was small. Amongst these, Richard de Bury, Bishop of Durham, holds a distinguished place.

The revival of learning in the 14th and 15th centuries, followed immediately by the invention of the art of printing, led naturally to a vast increase in the production of books, and introduced a new era in the history of public libraries. The number of these establishments which have since sprung into existence is immense, and is constantly increasing; so much so, that a bare list of them would far exceed the limits of an article like the present. All, therefore, that we propose to do is to give a short account of the most important and interesting amongst them.

First among the libraries of Great Britain, and second to few, if to any abroad, is that of the British Museum. For an account of this magnificent collection, see **BRITISH MUSEUM**. Next in rank is the Bodleian Library at Oxford, which has also been already described. See **BODLEYAN** or **BODLEIAN LIBRARY**. The third and fourth places are occupied by the Public, or University, Library of Cambridge, and the Library of the Faculty of Advocates at Edinburgh, which are nearly on a par as regards extent and value. A notice of the latter will be found under the heading **ADVOCATES' LIBRARY**; but the number of volumes which it contains has been slightly understated in the article referred to. At present (1863), they are not fewer than 180,000. The Library of Trinity College, Dublin, with about 130,000 volumes, is the largest and most valuable in Ireland. These five libraries have long been, and still are, entitled by statute to a copy of every book published in the empire; the act of parliament by which the privilege is at present regulated is the 5 and 6 Vict. c. 45. Besides the above, six other libraries had been in the enjoyment of the same privilege up to the year 1836. By the act 6 and 7 Will. IV. c. 110, which was then passed, the number was reduced from eleven to five; compensation

LIBRARIES.

for the loss of the privilege being allowed, in the form of an annual grant of money charged on the Consolidated Fund. The amount of this grant was, in each case, determined by a computation of the average annual value of the books received during the three years immediately preceding the passing of the act. The names of the libraries referred to, with the number of volumes they at present contain, and the annual sum received in lieu of the privilege, are as follows :

Edinburgh University,	100,000	£375
Glasgow "	70,000	707
St Andrews "	65,000	630
Aberdeen "	48,000*	380
Queen's Inn's, Dublin,	35,000	433
Slon College, London,	80,000	363

The minor libraries of Great Britain are so numerous, that a mere list of their names would exceed the limits within which an article like the present must be confined. Amongst those deserving special notice are the Library of the Society of Writers to the Signet, Edinburgh, containing upwards of 45,000 volumes; the Hunterian Library, Glasgow, with about 13,000 volumes, including many choice specimens of early printing; the Chetham Library, Manchester, upwards of 18,000 volumes; Dr Williams's Library, Red Cross Street, London, with more than 20,000 volumes, freely open to the public; the Archbishop's Library at Lambeth, containing at least 25,000 volumes; Marsh's Library, Dublin, the most liberally accessible collection in Ireland, with about 18,000 volumes; and the libraries belonging to the different colleges at Oxford and Cambridge, some of which are of considerable extent and value. The Public Libraries' Acts of 1850 and 1855 have been adopted by several of the large towns in England, Manchester and Liverpool being the most important. The free libraries established in these places under the provisions of the acts just named are in a flourishing condition. Of private libraries in England, it will be sufficient to name that of Earl Spencer, at Althorp, containing upwards of 50,000 volumes, many of extreme rarity and value, and all in admirable condition.

The great national library of France, *La Bibliothèque du Roi*, as it used to be called, *La Bibliothèque Impériale*, as it is called at present, is one of the largest and most valuable collections of books and manuscripts in the world. Attempts to form a library had been made by Louis XI and his successors with considerable success; but the appointment of De Thou to the office of chief librarian by Henry IV. may be regarded as the foundation of the establishment as it now exists. The number of printed volumes contained in it is estimated at nearly 900,000, and of manuscripts at about 90,000. Amongst libraries of the second class existing in Paris, the Mazarine Library, and the Library of St. Geneviève, are the chief. The former contains nearly 140,000 volumes; the latter, upwards of 180,000. Many excellent libraries are to be found in the provincial towns of France, particularly at Rouen, Bordeaux, Lyon, and Strasbourg.

Italy is rich in important libraries, amongst which that of the Vatican at Rome stands pre-eminent. The number of printed volumes contained in it cannot be stated with accuracy; but it is in the manuscript department—replete with treasures of the rarest and most valuable kind—that its chief strength lies. The Casanatà Library, also at Rome, is said to contain upwards of 200,000 volumes. The Ambrosian Library, at Milan, has a collection of nearly 100,000 volumes; and the Brera Library, of

the same city, one of about 120,000. At Florence we find the Laurentian Library, consisting almost entirely of manuscripts; and the Magliabechi Library, with about 160,000 volumes. Amongst the other libraries of Italy worthy of notice are the Royal Library at Naples, with 200,000 volumes, and that of St Mark at Venice, with 120,000.

The principal libraries of Spain are the *Biblioteca Real* at Madrid, numbering nearly 200,000 volumes, and the Library of the Escorial, which has been already noticed. See *ESCUERIAL*.—Of the libraries of Portugal, no trustworthy statistics can be obtained.

The Imperial Library at Vienna, founded by the Emperor Frederick III., in the year 1440, is a noble collection of not fewer than 400,000 volumes; of which 15,000 are of the class called *incunabula*, or books printed before the year 1500. The Royal Library at Munich owes its origin to Albert V., Duke of Bavaria, about the middle of the 16th century. The statements which have been made as to the extent of this library are of a very conflicting character, varying from 400,000 volumes on the one hand to 800,000 on the other. The real number is probably about 600,000. It is worthily lodged in the splendid building erected by the late king, Ludwig I., in the Ludwig Strasse. The Royal Library at Dresden is a collection of nearly 320,000 volumes, amongst which are included some of the scarcest specimens of early printing, amongst others the Mainz Psalter of 1457, the first book printed with a date. The foundation of the Royal Library at Berlin dates from about the year 1650. It now extends to about 530,000 volumes of printed books, and 10,000 volumes of manuscripts, including amongst the latter many precious relics of Luther and the other leaders of the Reformation. Of the other libraries of Germany, it will perhaps be enough to notice that of the university of Göttingen, with upwards of 350,000 volumes; and the ducal library of Wolfenbüttel, with about 200,000.

In Holland, the principal library is the Royal Library at the Hague, containing rather more than 100,000 volumes, of which about 1500 are good specimens of early printing.

The Royal Library at Copenhagen was founded about the middle of the 16th century. Its contents are now estimated at nearly 450,000 volumes. The University Library possesses nearly 160,000 volumes; and Classen's Library, also in Copenhagen, about 30,000.

In Sweden, the largest library is that of the university of Upsal, consisting of nearly 140,000 volumes. One of its chief treasures is the famous manuscript of the Gothic Gospels of Ulfilas, commonly known as the *Codex Argenteus*. The university of Lund possesses a collection of upwards of 70,000 volumes.

The library of the university of Christiania in Norway, founded in 1811, contains upwards of 115,000 volumes.

The Imperial Library of St Petersburg was founded about the beginning of the 18th century. In the year 1795, it was largely increased by the addition of the Zaluski Library of Warsaw, which was seized and carried off to St Petersburg by Suwaroff. At present, the total number of volumes cannot be less than about 550,000.

In the United States of America, though there are no libraries equalling those of the first rank in Europe, there are still not a few of considerable magnitude and value. The oldest and one of the largest amongst them is that of Harvard College, Cambridge, Massachusetts, which has been in existence for more than 200 years, and contains nearly 100,000 volumes. Libraries are also attached to the

* About three-fourths of these are lodged in King's College, and the remainder in Marischal College.

other collegiate institutions of the country. The Astor Library, New York, named after its liberal founder, was opened in 1854 with a collection of about 80,000 volumes, which has since been largely increased. It is in the fullest sense a free public library. The Smithsonian Institution at Washington embraces in its plan the formation of an extensive library. As yet, but little progress has been made in carrying out this part of the scheme, which is much to be regretted. The number of volumes already acquired cannot be stated. The proprietary libraries of the United States are numerous, and several of them are of considerable extent; that of Philadelphia, in the foundation of which Franklin was largely concerned, numbers upwards of 60,000 volumes; and that of the Boston Athenæum, founded in 1806, is still larger. It is to be feared that the present state of affairs in America may inflict serious injury on these establishments.

The best work on the subject of libraries is Edwards's *Memoirs of Libraries* (2 vols. London, 1859), which those desirous of further information may consult with advantage.

LIBRARIES' ACTS. Though there is no systematic provision of libraries for public use, at the expense of the state, except the British Museum Library in London, an attempt has been made by the legislature of late years to empower districts to establish libraries, and to tax the inhabitants for that purpose. The first act was passed in 1850 for England, but has been repealed by the act 18 and 19 Vict. c. 70, in 1855. Town councils of towns having a population exceeding 5000, may, after due notice, convene a public meeting of the burgesses, and two-thirds may resolve to establish a library, and rate the inhabitants. So in parishes of a like population, and local improvement districts, two-thirds of the ratepayers may also adopt the act. The rate to be levied in all such cases is not to exceed one penny in the pound. All such libraries are to be open to the public, free of all charge. A similar act, 16 and 17 Vict. c. 101, extended the first English act, 13 and 14 Vict. c. 65, to Ireland and Scotland, but is not so extensive, as it applies only to boroughs in Ireland and Scotland having a population of 10,000.

LIBRARIES, MILITARY, are either garrison or regimental. The former comprise large collections of books, with newspapers, games, lectures, &c., in commodious rooms, and are intended to win soldiers from the gin-shops and vicious haunts which are ever prevalent in garrison towns. Attempts have been made to provide the soldiers with books, both for instruction and amusement; but statistics prove that the men patronise few besides fiction and travels, and religious books not at all. Regimental libraries are smaller collections of books, which accompany regiments in their various movements. The charge for military libraries in the British army is for 1863—1864 the sum of £4213.

LIBRATION (from Lat. *libra*, a balance, meaning a balancing or oscillating motion), a term applied to certain phenomena of the moon's motion. The moon's librations (or, more properly, *apparent* librations) are of three kinds—libration in longitude, in latitude, and the diurnal libration. If the moon's rotation in her orbit were uniform, as her rotation on her axis is, we should always see exactly the same portion of her surface, but as this is not the case, there are two small strips of surface running from pole to pole, on the east and west sides, which become alternately visible; this is called the moon's *longitudinal libration*. The *libration in latitude* arises from the moon's axis not being perpendicular to her orbit, in consequence of which, a portion of

her surface round the north pole is visible during one half, and a corresponding portion round the south pole during the other half of her revolution in her orbit. The *diurnal libration* hardly deserves the name, and is simply a consequence of the observer's position on the surface of the earth, and not at the centre: it consists in the gradual disappearance of certain points on one edge of the moon's disk as she approaches her culmination, and the appearance of new points on her opposite border as she descends. The first and third of these librations were discovered by Galileo, and the second by Hevelius.

LIBYA, the name given by the oldest geographers to Africa. In Homer and Hesiod, it denoted the whole of this quarter of the globe, except Egypt; in Herodotus, occasionally, the entire continent; but it is also applied by others in a more restricted sense, to the northern part of the country, from Egypt and the Arabian Gulf westward to Mount Atlas. The great sandy tract of which the Sahara forms the principal part, was called the Libyan Desert. To what extent it was known to the ancients is not very clearly ascertained. See **AFRICA**.

LICENCE. See **GAME, PUBLIC-HOUSES, MARRIAGE, ALIEN.**

LICENTIATE (from Lat. *licet*, it is lawful), one of the four ancient university degrees. It is no longer in use in England, except at Cambridge, which confers the degree of licentiate of medicine. In France and Germany, however, where it is more general, a licentiate is a person who, having undergone the prescribed examination, has received permission to deliver lectures. The degree, as an honour, is intermediate between *Bachelor of Arts* and *Doctor*.

LICENTIATE, among Presbyterians, is a person authorised by a presbytery or similar body to preach, and who thus becomes eligible to a pastoral charge.

LICHEN, a papular disease of the skin. There are two species, viz., *L. simplex* and *L. agrius*, the latter of which may be regarded as a very aggravated form of the former. *L. simplex* consists in an eruption of minute papule of a red colour, which never contain a fluid, and are distributed irregularly over the body. They appear first on the face and arms, then extend to the trunk and lower extremities, and are accompanied with a sense of heat, itching, and tingling. In a mild case, the disease is over in a week, but sometimes one crop of papule succeeds another for many weeks or months. In *L. agrius*, the papule are more pointed at the summit, and are of a bright-red colour, with more or less redness extending round them. In this form of the disease, the general health is usually affected, in consequence of loss of sleep and general irritation.

It is often hard to say what is the cause of lichen. The simpler form is often dependent in children on intestinal irritation, while in other cases it may frequently be traced to exposure to heat, or errors of diet. The severe form is also occasioned by extreme heat and by the abuse of spirituous drinks.

In ordinary cases, an antiphlogistic diet, a few gentle aperients, and two or three tepid baths, are all that is required. When the disease assumes a chronic character, a tonic treatment (bark and the mineral acids) is necessary; and in very obstinate cases, small doses (three to five minims, well diluted) of Fowler's Arsenical Solution may be given with advantage.

LICHENIN is a starch-like body, found in Iceland moss and other lichens, from which it is extracted by digesting the moss in a cold, weak solution of carbonate of soda for some time, and

then boiling. By this process, the lichenin is dissolved, and on cooling, separates as a colourless jelly. According to Gorup-Besanez (*Lehrbuch der organischen Chemie*, 1860, p. 514), it sometimes assumes a blue, and sometimes a greenish tint, when treated with iodine. In most of its relations it corresponds with ordinary starch.

LICHENS, a natural order of acotyledonous plants, allied to Fungi and to Alga. They are *thallogenous*, consisting mainly of a *Thallus* (q. v.), and without stem and leaves; wholly cellular, and nourished through their whole surface by the medium in which they live, which is air, and not water, although a certain amount of moisture in the air is always necessary to their active growth; and when the air becomes very dry, they become dormant, ready to resume their growth on the return of more favourable weather. The thallus of some is pulverulent; that of others is crustaceous; of others, leaf-like; of others, fibrous. Reproduction takes place by spores, usually contained in sacs (*asci*, *thecae*), embodied in repositories of various form, often shield-like or disc-like, called *apothecia* (or shields), which arise from the outer layer of the thallus, and are generally very different in colour from the thallus. But there is also another mode of propagation by *gonidia*, separated cells of the inner or medullary layer of the thallus, usually spherical or nearly so, and always of a green colour. This seems to be a provision for the propagation of L., even in circumstances—as of the absence of light—unfavourable to the formation of thecae and spores. L. are plants of long life, differing in this very widely from fungi. They are most widely diffused, growing equally in the warmest and the coldest regions. On the utmost limits of vegetation, in very high latitudes, or on the very highest mountains, they cover the soil in great masses. Some grow on earth, others on stones, others on the bark of trees, and some of the tropical species on evergreen leaves. In the great economy of nature, they serve for the first commencement of vegetation, especially to prepare the soil for plants of higher organisation. The gray, yellow, and brown stains on old walls are produced by minute L., which have begun to vegetate where nothing else could. The curiously scattered apothecia of some present the appearance of written characters often seen on the bark of trees. Some hang as tufts or shaggy beards from old trees, some grow amidst heaths and mosses to cover the soil of the most frigid regions. L. contain a peculiar gelatinous substance resembling starch, and called *Lichenia* or *Lichen Starch*; generally also a bitter substance called *Cetrarine*; resin; a red, bright yellow, or brown colouring matter; oxalate and phosphate of lime, &c.; and are therefore adapted to purposes of domestic economy, medicine, and the arts. Some are used for food, as Iceland Moss (q. v.) and *Tripe de Roche* (q. v.); some afford food for cattle, as Reindeer Moss (q. v.); some are medicinal, as Iceland Moss; some afford dye-stuffs, as Archil (q. v.), Cudbear (q. v.), &c.

LICHFIELD, an ancient episcopal city of Staffordshire, England, a municipal and parliamentary borough and county in itself, is situated 17 miles south-east of Stafford, and 115 north-west of London. Its chief edifice is the cathedral, part of which is in the Early English style. It has three towers, each surmounted by a spire, and is profuse and elaborate in its ornamentation. The Free Grammar-school, in which Addison, Ashmole, Johnson, and Garrick were educated, has an income of about £100 a year, and has nine exhibitions, tenable for three years. Considerable brewing is carried on. Pop. 6993. L. returns two members to parliament.

LICINIUS, a Roman emperor. See **CONSTANTINE I.**

LICTORS (according to Aulus Gellius, from *ligare*, to bind, because the lictors had to bind the hands and feet of criminals before punishing them) were, among the Romans, the official attendants of magistrates of the highest rank. They carried the *Fasces* (q. v.) before the magistrates, clearing the way, and enforcing the use of the appropriate marks of respect. It was their duty to execute the punishments ordered by the magistrates, such as scourging with rods, and beheading. They were originally free men of the plebeian order, and not till the time of Tacitus could the office be held by freedmen. Slaves were never appointed lictors.

LIE, in point of Law, is not a ground of action, unless in peculiar circumstances. If, for example, it is material, and is uttered by a witness or deponent, it is the criminal offence of perjury. Sometimes, also, if a person, knowing that another will act upon his information, tell a lie, and which is believed to be true, and acted on, and damage follows, the party telling the lie may be sued for the damages. But in other cases, lying *per se* is not punishable by law; civilly or criminally.

LIEBIG, JUSTUS, BARON VON, one of the greatest chemists of the present day, was born at Darmstadt, 12th May 1803. He early showed a strong predilection for natural science. He studied at Bonn and Erlangen, and afterwards in Paris, where he attracted the attention of Alexander von Humboldt by a paper on Fulminic Acid. This led to his appointment, in 1824, as Extraordinary Professor, and in 1826, as Ordinary Professor of Chemistry at Giessen, where he laboured with great activity for more than a quarter of a century, making that small university a centre of attraction to students of chemistry from all parts of Germany and from foreign countries. Many honours were conferred on him. The Duke of Hesse raised him to the rank of baron. In 1852, he accepted a professorship in the university of Munich, and the charge of the chemical laboratory there; and in 1860 was appointed president of the Munich Academy of Sciences, as the successor of Thiersch.

L. has laboured with success in all departments of chemistry, but particularly in organic chemistry, in which he has made many discoveries and done much to improve the methods of analysis. He has investigated with great care the relations of organic chemistry to physiology, pathology, agriculture, &c.; and although many of his views have been combated, and several have been abandoned by the author himself, it is, nevertheless, universally admitted that his researches have greatly advanced the science of agriculture in particular. Many of his papers are contained in the *Annalen der Chemie und Pharmacie*. He published the *Wörterbuch der Chemie* (Brunsw. 1837—1851) in conjunction with Poggendorf, and also a Supplement to this work (1850—1852), but the discoveries of more recent years are exhibited in the later volumes. He wrote the part relative to Organic Chemistry in the new edition of Geiger's *Handbuch der Pharmacie* (Heidelb. 1839), published afterwards as *Die Organische Chemie in ihrer Anwendung auf Physiologie und Pathologie*, which was translated into French and English (1842). His work on *Organic Chemistry in its Application to Agriculture* (Brunsw. 1840; English translation by Dr Lyon Playfair, 1840; and French translation by Gerhardt, 1840), and his *Chemical Letters* (Paris, 1862), all of which have gone through numerous editions, and have been translated into different languages, are among the most valuable contributions to chemical literature which have been made in our age.

LIECHTENSTEIN, the smallest principality of the German Confederation, has an area of only 60 square miles, with a pop. of 7150. L. is a mountainous district, lying on the Upper Rhine, between Switzerland and the Tyrol, the latter bounding it to the N. and E., while the Rhine forms its western, and the canton of the Grisons its southern boundary. It is divided into the districts of Vadutz and Schellenberg, and the principal town is Liechtenstein (pop. 1000), formerly known as Vadutz. The products are wheat, flax, and good wines and fruit. Considerable numbers of cattle are raised, and game is abundant. L., together with several other small states, forms the 15th member of the German Confederation, but in the *Plenum*, or full Council of the Diet, it has a separate vote. It furnishes a contingent of 70 men to the federal army. The Prince of L., whose family is one of the most ancient and illustrious of Central Europe, possesses extensive mediatised principalities in Austria, Prussia, and Saxony, which together extend over an area of nearly 2200 square miles, with a population of more than 600,000, and yield their proprietor an annual revenue of 1,400,000 florins. The government of L. is administered by the aid of a chamber of representatives, who meet annually to hold a diet, but whose acts are under the control of a Council of State, which has its seat at Vienna, where the prince usually resides. The revenue of L., independently of the mediatised possessions of the sovereign, amounts to 31,000 thalers. There is no national debt.

LIEGE (so called in French, but by the Germans *Lüttich*, and by the Flemings *Luyk*) is the most easterly province of Belgium. Area, 1106 square miles; pop. (1861) 530,398. The southern part of the province is hilly, rocky, heathy, and much covered with wood, in some places yielding, however, great quantities of coal and iron; but the part called the *Herveland* (north of the Weeze) is extraordinarily fertile and well cultivated, and has also splendid pasturage for cattle. The valley of the Weeze is very beautiful, and exhibits an endless diversity of scenery. The railway from Aix-la-Chapelle to L., which passes through this valley, has had immense difficulties to overcome in the nature of the ground, and is consequently regarded as a *chef-d'œuvre* of the kind. Nearly a sixth of the whole road had to be artificially constructed. The inhabitants are Walloons.

LIEGE, capital of the province of the same name, is situated on the Meuse, immediately below its confluence with the Ourthe, in a magnificent plain. A hill rises on each side of the city, one of which is occupied by the citadel. The river, which divides L. into two parts, the old and the new town, is crossed by 17 bridges. L. is said to be the most picturesque city in Belgium. Many of the public buildings are fine, especially the churches, of which the principal are the Church of St James (founded 1014, finished 1538), the cathedral (finished 1567), the Church of St Martin's, the Church of the Holy Cross (consecrated 979), and St Bartholemey (which has 5 naves). The Palace of Justice, with its paintings and 60 rooms—formerly the residence of the episcopal princes of L.—and the University, noted for its mining-school, also deserve mention. The general interior of the city, however, is by no means pleasant; everything is blackened by the smoke of the coal-pits, which have been worked for 300 years; the streets are narrow, the houses high, badly aired, and uncleanly. The manufacture of arms is the great staple of industry. Everywhere the hammer is heard; countless forges flash out their sudden sparks, and whole streets are red with the reflection of fires.

All kinds of steam-machinery, locomotives, steam-boats, &c., are made here for Germany. In the immediate neighbourhood are important zinc-foundries. L. is connected by railways with Brussels, Antwerp, Namur, &c. Pop. (1861) 96,207.

L. became the seat of a bishop in the 8th c., and continued to be so till 1794; and its bishops were reckoned among the princes of the German empire; but as it early acquired considerable magnitude and importance, its inhabitants maintained a struggle for their own independence against their bishops, in which frequent appeals were made to arms. During the wars of Louis XIV., it was several times taken and retaken.

LIEGE POUSTIE. See DEATH-BED.

LIEGNITZ, a town of Prussia, in the government of Silesia, at the confluence of the Schwarzwasser and the Katzbach, 40 miles west-north-west of Breslau. It has numerous educational and benevolent institutions, art-collections, and industrial museums. Cloth, leather, and tobacco are largely manufactured, and vegetables are extensively cultivated in the gardens of the suburbs. This town was, from 1164 to 1675, the residence of the Dukes of Liegnitz. Here, in 1813, Blücher defeated the French. Pop. 16,584, of whom about 3000 are Catholics.

LIEN, in English and Irish Law, means the security or hold over goods or land for a debt which is due. A right of lien is the right to retain goods of a third party which are in the creditor's hands, until a debt due by such party to the creditor is paid. Possession is in general essential to constitute a lien, for the moment the goods are voluntarily parted with the lien is gone. Liens are general or particular. Thus, an attorney has a general lien over his client's papers and title-deeds till the amount of his bill of costs is paid. So have bankers, dyers, calico-printers, factors. A particular lien is a lien over goods, for a debt contracted in respect of such goods, as for the price of them, or some labour expended on them. Thus, a miller has a lien on the flour he has ground, a trainer on the horse he has trained, &c. There are also maritime liens and equitable liens, which do not require possession to constitute the right. In Scotland, lien is generally called either *Retention* (q. v.) or *Hypotheec* (q. v.).

LIEBBERE, a town of Belgium, in the province of Antwerp, 10 miles south-east of the city of that name, at the confluence of the Great and Little Netho. L. has noted breweries; extensive manufactures of linen, silk, lace, and musical instruments are carried on, and there are several sugar-refineries and oil-mills. Pop. 15,000.

LIEUTENANT (Fr. from *Lat. locum-tenens*, holding the place of another), a term applied to a variety of offices of a representative kind. Thus, in military matters, a *lieutenant-general* personates with each division of an army the general-in-chief. A *lieutenant-colonel* (q. v.) commands a battalion for a colonel, in the latter's absence. But the title lieutenant, without qualification, denotes the second officer and deputy, or *locum-tenens*, of the captain in each company of cavalry or infantry. A lieutenant in the British Foot Guards ranks as captain in the army, and exchanges with a captain in another regiment.—*Captain-lieutenant*, an obsolete rank, was the subaltern who commanded the 'colonel's company' in each regiment.—A *second-lieutenant* is the junior subaltern of a company, and corresponds to an Ensign (q. v.). The pay of a lieutenant varies from 10s. 4d. a day in the Life Guards to 6s. 6d. in the line.

In the British navy, lieutenant is a misnomer in the case of the officer bearing that title. His

functions in all respects correspond to those of a captain in the army, with whom he ranks, and with whom he also nearly matches in regard to pay. A lieutenant's full pay is 10s. a day; and his half-pay ranges, according to length of services, from 4s. to 7s. a day. Six years' service afloat are requisite to qualify an officer for the rank of lieutenant, and the candidate has also to pass a satisfactory examination in seamanship and general professional knowledge. As leaders in all minor enterprises, such as boat expeditions, cutting out, &c., lieutenants in war-time carry off most of the laurels awarded to actions of singular personal daring.

LIEUTENANT, LORD-, OF A COUNTY, a permanent provincial governor appointed by the sovereign by patent under the great seal. The office in England arose from the occasional commissions of array issued by the crown in times of danger or disturbance, requiring experienced persons to muster the inhabitants of the counties to which the commissioners were sent, and set them in military order. The right of the crown to issue such commissions was denied by the Long Parliament, this question proving the immediate cause of the breach between Charles I. and his subjects. Their legality was established at the Restoration by a declaratory act. The lord-lieutenant is now the permanent local representative of the crown, who, on the occasion of an invasion or rebellion, has power to raise the militia, form regiments, troops, and companies, and give commissions to officers. The history of the office seems to have been somewhat similar in Scotland. In act 1438 c. 3, the 'lieutenant' is commanded to 'raise the county' whenever it may be necessary to bring the rebellious and unruly possessors of castles and fortalices into subjection; and though his powers were executive rather than judicial, he seems sometimes to have had authority to exercise the functions of the sheriff, or overrule his decisions. The lord-lieutenant of a county is at the head of the magistracy, the militia, and the yeomanry; he nominates officers of militia and volunteers, and is the chief executive authority, forming the settled channel of communication between the government and the magistracy, and considered as responsible in cases of emergency for the preservation of public tranquillity. Under him, are permanent deputy-lieutenants appointed by him.

LIEUTENANT, LORD-, OF IRELAND, the viceroy or deputy of the sovereign to whom the government of Ireland is committed. The office has existed from a remote period, the appointment having been made under different designations. His powers were in early times very extensive, almost regal. For the last half century following the Revolution, the lord-lieutenant resided little in Ireland, visiting it only once in two years, to hold the session of parliament. Some lords-lieutenant never went to Ireland at all, and occasionally, instead of a viceroy, lords-justices (see **JUSTICES, LORDS**) were appointed.

The lord-lieutenant is appointed under the great seal of the United Kingdom, and bears the sword of state as the symbol of his viceregal office. He has the assistance of a privy-council of 58 members, appointed by the sovereign, and of officers of state. He is commissioned to keep the peace, and the laws and customs of Ireland, and to see that justice is impartially administered. He has the control of the police, and may issue orders to the general commanding the troops for the support of the civil authority, the protection of the public, the defence of the kingdom, and the suppression of insurrection. He may confer knighthood, and has the disposal of church preferment (except bishops' sees and deaneries), as well as all the other patronage of the

country. The granting of money, and lands, and pensions, of all titles of honour except simple knighthood, the appointment of privy-councillors, judges, law-officers, and governors of forts, and the appointment to military commissions, are reserved to the sovereign, acting, however, on the lord-lieutenant's advice and recommendation. No complaint of injustice or oppression in Ireland will be entertained by the sovereign until first made to the lord-lieutenant, who is in no case required to execute the royal instructions in a matter of which he may disapprove until he can communicate with the sovereign and receive further orders. Yet, notwithstanding the dignity and responsibility of his office, the lord-lieutenant acts in every matter of importance under the direct control of the cabinet of Great Britain. The views and opinions of the cabinet on all the more important questions connected with his government are communicated to him by the Home Secretary, who is held responsible for the government of Ireland, and with whom it is the duty of the lord-lieutenant to be in close correspondence; on matters of revenue, he must be in constant communication with the Treasury. On his occasional or temporary absence from Ireland, lords-justices are appointed, who are usually the Lord Primate, the Lord Chancellor, and the Commander of the Forces. His salary is £20,000, with a residence in Dublin Castle, as well as one in Phoenix Park. His tenure of office depends on that of the ministry of which he is a member. By act 10 Geo. IV. c. 7, a Roman Catholic is ineligible for the lieutenancy of Ireland.

LIEUTENANT-COLONEL, in the British Army, is nominally the second officer in a regiment; but virtually a lieutenant-colonel commands every battalion of infantry and regiment of cavalry, the post of colonel being merely an honourable sinecure, with usually £1000 a year attached, awarded to a general officer. The lieutenant-colonel is responsible for the discipline of his battalion, the comfort of his men, and ultimately for every detail connected with their organisation. He is assisted in his duties by the major. In the artillery and engineers, where the rank of colonel is a substantive rank, with tangible regimental duties, the functions of lieutenant-colonel are more limited, one having charge of every two batteries of artillery, or two companies of engineers. The pay of a lieutenant-colonel varies from £1, 9s. 2d. per diem in the Household Cavalry to 27s. in the infantry of the line. Five years' regimental service as lieutenant-colonel entitles an officer to brevet rank as colonel, which, while improving his position in the army, does not, however, affect his status in his regiment.

LIEUTENANT-GENERAL. See **GENERAL OFFICER**.

LIFE. In seeking a definition of life, it is difficult to find one that does not include more than is necessary, or exclude something that should be taken in. Richerand's definition of life, that it is 'a collection of phenomena which succeed each other during a limited time in an organised body,' is equally applicable to the decay which goes on after death. According to De Blainville, 'life is the twofold internal movement of composition and decomposition, at once general and continuous.' As Mr Herbert Spencer in his *Principles of Biology* well observes, this conception is in some respects too narrow, and in other respects too wide. Thus, it excludes those nervous and muscular functions which form the most conspicuous and distinctive classes of vital phenomena, while it equally applies to the processes going on in a living body and in a galvanic battery. Mr Spencer (in 1852) proposed to define life as 'the co-ordination of actions,' but, as he

observes, 'Like the others, this definition includes too much, for it may be said of the solar system, with its regularly recurring movements and its self-balancing perturbations, that it also exhibits co-ordination of actions.' His present and amended conception of life is: 'The definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external co-existences and sequences.' One of the latest definitions of life is that which has been suggested by Mr G. H. Lewes: 'Life is a series of definite and successive changes, both of structure and composition, which take place within an individual without destroying its identity.' This is perhaps as good a definition as has yet been given; but no one of those we have quoted is more than approximately true, and a perfect definition of life seems to be an impossibility.

LIFE, MEAN DURATION OF. By this term is meant the average length of life enjoyed by a given number of persons of the same age. Suppose we look at the Northampton Table of Mortality, we find that, of 3635 persons aged forty, 3559 reach forty-one, 3482 reach forty-two, and so on; the whole failing at ninety-six. The average age then attained by the 3635 persons being ascertained on these data, would be the mean duration of life after the age of forty has been reached. Suppose, then, that *a* be the given number alive at a given age by a given mortality table, and *b* the number alive at the end of the first year, *c* the number alive at the end of the second, and so on; and then there die at the end of the first year, *a - b*; and assuming that those who have died have, on an average, lived half a year, the aggregate length of life enjoyed by those who have died during the first year will be $\frac{1}{2}(a-b)$ years; then *b* being still alive, the *a* persons have enjoyed, at the end of the first year, $\frac{1}{2}(a-b) + b = \frac{1}{2}(a+b)$ years. In the second year, the *a* persons enjoy $\frac{1}{2}(b+c)$; in the third, the *c* persons enjoy $\frac{1}{2}(c+d)$ years; and so on. Summing these, and dividing by the original number of lives, so as to ascertain the average, gives $\frac{1}{2} + \frac{b+c+d}{a}$; hence the rule: Add the numbers alive at each age above that given, divide by the number alive at the given age, and add half a year. The mean duration of life at a given age is often called the 'expectation of life,' but this is clearly a wrong term to use. Of 1000 lives at twenty, suppose 500 to reach forty-five; then a man aged twenty has an equal chance of reaching forty-five, and twenty-five years would be his expectation of life. But it clearly does not follow that taking the 500 who have not reached twenty-five, along with the 500 who have survived it, we should find, on extinction of the whole, that the mean duration was twenty-five years. It might be either greater or less. The term 'expectation of life,' as generally applied by assurance companies to denote mean duration, is therefore a wrong one. In connection with this subject, see MORTALITY, also MAN.

LIFE-ASSURANCE. See INSURANCE.

LIFE-BOAT, a boat adapted to 'live' in a stormy sea, with a view to the saving of life from shipwreck. Its qualities must be buoyancy, to avoid foundering when a sea is shipped; strength, to escape destruction from the violence of waves, from a rocky beach, or from collision with the wreck; facility in turning; and a power of righting when capsized.

A melancholy wreck at Tynemouth, in September 1789, suggested to the subscribers to the South

Shields News-room, who had witnessed the destruction of the crew one by one, that some special construction of boat might be devised for saving life from stranded vessels. They immediately offered a premium for the best form of life-boat; and the first boat built with the express object of saving life was that constructed on this occasion by Mr Henry Greathead. It was of great strength, having the form of the quarter of a spheroid, with sides protected and rendered buoyant within and without by the superposition of layers of cork. So useful was it in the first twenty-one years after its introduction, that 300 lives were saved through its instrumentality in the mouth of the Tyne alone. Mr Greathead received the gold medals of the Society of Arts and Royal Humane Society, £1200 from parliament in 1802, and a purse of 100 guineas from Lloyd's, the members of which society also voted £2000 to encourage the building of life-boats on different parts of the coast. Although various other life-boats have been invented from time to time, Greathead's remained the general favourite until about the year 1851, and many of his construction are still to be seen on different points of the coast. They failed, however, occasionally; and several sad mishaps befell the crews of life-boats, especially in the case of one at South Shields, in which twenty pilots perished. Upon this the Duke of Northumberland offered a prize for an improved construction, and numerous designs were submitted, a hundred of the best of which were exhibited in 1851. Mr James Beeching of Yarmouth obtained the award; but his boat was not considered entirely satisfactory, and Mr R. Peake, of Her Majesty's Dockyard at Woolwich, was intrusted with the task of producing a life-boat which should combine the best qualities of the different inventions. His efforts were very successful, and the National Life-boat Institution adopted his model as the standard for the boats they should thereafter establish on the coasts.

Sections of Mr Peake's life-boat are shewn below, one lengthwise through the keel, the other crosswise in the middle. A, A, are the thwarts on which the rowers sit; BB, a water-tight deck, raised sufficiently above the bottom of the boat to be above the level of the sea when the boat is loaded; C, C, are air-tight chambers running along each side, and occupying from 3 to 4 feet at each end:

Fig. 1.—Section lengthwise.

the buoyancy afforded by these more than suffice to sustain the boat when fully laden, even if filled with water. To diminish the liability to capsize in a heavy sea, the life-boat has great beam (breadth) in proportion to her length, viz., 8 feet beam to 30 length. In addition, the bottom is almost flat. As in her build it has been found convenient to dispense with cross-pieces, some means are required to preserve the rigidity of the whole structure amid the buffeting of a tempest. To achieve this, and also to serve the purposes of light ballast, Mr Peake fills the space between the boat's bottom and the water-tight deck (BB) with blocks, tightly wedged together of cork and light hard wood, D, D. These would form a false bottom, were a rent made in the outer covering, and, by their comparative weight, counteract in some degree the top-heaviness induced by the air-vessels, which are entirely above the water

line (E). This arrangement would be insufficient to maintain the equilibrium of the boat, however, and especially under sail, so Mr Peake has added a

Fig. 2.—Section crosswise.

heavy iron keel (E) of from 4 to 8 cwt., which effectually keeps the boat straight. Some builders object to this iron ballast: the Liverpool and Norfolk boats take out their plugs, and preferably admit water until steadiness is secured; but Mr Peake has an additional object in view—that of causing the boat to immediately right itself if turned upside down, as the best boats sometimes will be in heavy gales. It will be noticed that the ends of the boat rise above the centre $1\frac{1}{2}$ to 2 feet. This, for one thing, facilitates turning, as the pivot on which her weight rests is shortened; for another, if she capsizes and is thrown bottom up, these raised caissons are sufficient to sustain her by their buoyancy. So long, then, as she floats precisely in an inverted state, she will be steady; but the slightest motion to either side—which, of course, in practice ensues instantly—throws the heavy keel off the perpendicular, in which its centre of gravity was exactly over the line between bow and stern, and the boat must immediately right itself. This process is shewn in fig. 3.

Fig. 3.

where it will be perceived that the overturned boat must forthwith right itself in the direction indicated by the arrow, on account of the heavy top-weight at E. F is a covered trough, to contain the tackle, sails, &c., when not in use; in service, it is also useful to receive any water that may penetrate among the cork and wooden chocks beneath the water-tight deck: this leakage is at times considerable when the outer skin of the boat has sustained damage. The trough may be fitted with a small hand-pump, to enable one of the sitters to clear it out when necessary.

Perhaps the most beautiful contrivance in the life-boat is that for discharging the water which she ships. This consists of six relieving tubes, G, each six inches in diameter, passing through the deck, B, the ballast, D, and the bottom. The tubes, which are near the centre of the boat, three on each side, have at the bottom a valve opening outwards. As the deck, B, is always above the water-level, any water in the boat necessarily flows out through these tubes, so that if a wave bursts over her, and completely fills the boat, the relieving tubes free her, and she is empty again in a few minutes. The greater the height of water within, the faster will it run out. The advantages of the

life-boat may be thus summed up. The air-chambers and the light ballast render making impossible; the keel nearly prevents capsizing, and rectifies it, if it does happen; while the relieving tubes effectually clear off any water that finds its way within. With such precautions, the safety of the crew appears almost assured, and, in fact, loss of life in a life-boat is a very rare occurrence.

The boat is kept on a truck—of considerable strength, as the life-boat weighs two tons—close to the beach, and is drawn to the water's edge when required; the crew are trained to their work, and, it need not be added, are among the hardest of seamen. Ordinary life-boats are rowed by eight or twelve oars (of the best fir) double banked; but for small stations, where it would be difficult to collect so many men at short notice, smaller boats are made, rowing six oars single banked.

The importance of the life-boat in saving life can scarcely be over-estimated. Hundreds of vessels have their crews rescued through its use every year; and as the National Life-boat Institution obtains funds, this invention is being gradually extended all round the coast of the United Kingdom, while foreign nations have not been remiss in thus protecting their shores.

The Royal National Life-boat Institution, after an unrecognised existence of several years, was formally incorporated in 1824. Its objects are the provision, maintenance, and efficient working of life-boats on all parts of the coast; also, by granting rewards in places where the scanty population would not justify a life-boat station, the stimulation of coast-seamen to save life from wrecks. The society is of course dependent for its support on voluntary contributions, which have not hitherto failed; and it may safely be said, that scarcely can a nobler recipient for charity be found than this purely philanthropic institution. By the latest Report, it appeared that, up to December 1861, the society owned 121 life-boats in active employ; and that up to the same period, it had saved 12,272 lives from shipwreck, all of which would, there is reason to believe, have been lost but for its assistance. During 1861, the Institution received £15,093, and spent £6162 on new boats, houses, and gear, £3067 on repairs, £1368 in rewards, and £1950 on dockswains' wages and to the crews for practising quarterly. The cost of a new station complete (from £300 to £500) is frequently presented by some charitable individual.

The size of a common life-boat renders it inconvenient for stowage on shipboard. To obviate this, the Rev. E. L. Berthon, of Farnham, has invented a collapsing boat, which is readily expanded, possesses great strength, and at the same time occupies comparatively little space when out of use. Its sides are connected by various hinges. This boat is extensively employed for ocean steam-ships.

LIFE-ESTATE, in English Law, is an estate or interest in real property for a life. The life may be either that of the owner or of some third party, in which latter case it is called an estate *per autre vie*. Life-estates in lands are claimed among Freeholders (q. v.). The tenant for life has certain rights in regard to the uses of the estate. He is entitled to cut wood to repair fences, to burn in the house, &c. He cannot open a mine on the estate, but if it was already opened, he is entitled to carry it on for his own profit. Life-estates are created by deed, but there are certain estates created by law, as Courtesy (q. v.), Dower (q. v.), tenancy in tail after possibility of issue extinct. As to Scotland, see **LIFERENT**.

LIFE GUARDS, the two senior regiments of the mounted portion of the body-guard of the

British sovereign and garrison of London. They took their origin in two troops of horse-grenadiers raised respectively in 1663 and 1702: these troops were reduced in 1793, and reformed as regiments of Life Guards. Although usually employed about the court and metropolis, the Life Guards are not exempt from the liability to foreign service when required, having distinguished themselves in the Peninsula and at Waterloo. The men are all six feet high and upwards, armed with sword and carbine, wear knee-boots, leather breeches, red coats, and steel helmets. They also wear steel cuirasses, the utility of which is considered very doubtful. With this unwieldy armour, they require powerful horses, which are uniformly black. The two regiments comprise 878 men, with 550 horses, and their pay and personal allowances amount to £54,742.

LIFE-PRESERVERS, inventions for the preservation of life in cases of fire or shipwreck. The fire life-preservers will be found treated of under FIRE-ESCAPES. The other class includes the various contrivances for preserving the buoyancy of the human body, and for reaching the shore. Of these, the readiest and most effective are empty water-casks, well bunged-up, and with ropes attached to them to hold on by. It has been found that a 36-gallon cask so prepared can support ten men conveniently, in tolerably smooth water. Cook's and Rodger's patent life-rafts consist of square frames buoyed up by a cask at each corner. Among foreign nations, frames of bamboo, and inflated goat and seal skins, have been long employed as life-preservers; and in China, it is customary for those living on the banks of the canals to tie gourds to their children, to buoy them up in case of their falling into the water. Since the introduction of cork, jackets and belts of that material in immense variety have been patented. It has been calculated that one pound of cork is amply sufficient to support a man of ordinary size and make. A few years ago, on the invention of india-rubber cloth, inflated belts of this material were made, and found to be superior in buoyancy to the cork belt, besides, when emptied of air, being very portable. They are, however, much more liable to damage by being punctured or torn, or to decay by being put away while damp. Some of these defects are remedied by having the interior of the belt divided into several compartments; so that, when one is damaged, the remainder may still suffice. Various forms of inflated mattresses, pillows, &c., have been made on the same principle, and been found very effective; one shown at the Great Exhibition of 1851 having sustained 96 pounds for five days without injury. But the favourite life-buoy among sailors is composed of skins of cork neatly and compactly arranged, so as to form a buoyant mass of about 30 or 32 inches in diameter, 6 in width, and 4 in thickness. It consequently contains about 12 lbs. of cork, and is generally covered with painted canvas to add to its strength and protect it from the injurious action of the water. A buoy so constructed can sustain six persons, and it is generally furnished with a rope (a cord running round the outside of the buoy and fastened to it at four points) to afford a more convenient hold. This life-preserver is found on board of all vessels.

LIFERENT, in Scotch law, means a right to use a heritable estate or land the person acquiring it being called a *liferenter*. The rights of a *liferenter* nearly resemble those that are not identical with those of a tenant for life in England. See **LIFERENT**.

LIFT, noun, in shipboard the raising or lowering and maintaining in position the yards. They

pass from the deck over pulleys at the mast-head, and thence to near the extremities of the yard. The lift bears the designation of the yard to which it is attached, as *fore-lift*, *main-top-gallant-lift*, &c. See **RIGGING**.

LIGAMENTS are cords, bands, or membranous expansions of white fibrous tissue, which play a extremely important part in the mechanism of joints, seeing that they pass in fixed directions from one bone to another, and serve to limit some movements of a joint, while they freely allow others.

Todd and Bowman, in their *Physiological Anatomy*, arrange ligaments in three classes: 1. *Funicular*, rounded cords, such as the external lateral ligament of the knee-joint, the perpendicular ligament of the ankle-joint, &c.; 2. *Fascicular*, flattened bands, more or less expanded, such as the lateral ligaments of the elbow-joint, and the great majority of ligaments in the body; 3. *Capular*, which are barrel-shaped expansions attached by their two ends to the two bones entering into the formation of the joint, which they completely but loosely invest: they constitute one of the chief characters of the ball-and-socket joint, and occur in the shoulder and hip joints. See **JOINTS**.

LIGATURA, an Italian term in Music, meaning binding, frequently marked by a slur, thus (—) which is placed over certain notes for the purpose of shewing that they are to be blended together; if in vocal music, that they are to be sung with one breath; also used in instrumental music, to mark the phrasing.

LIGATURE, the term applied, in Surgery, to the thread tied round a blood-vessel to stop bleeding. The ligatures most commonly used consist of strong hempen or silk threads; but catgut, horse-hair, &c., have been employed by some surgeons. A ligature should be tied round an artery with sufficient tightness to cut through its middle and internal walls. Although the operation of tying arteries was clearly known to Rufus of Ephesus, who flourished in the time of Trajan, it subsequently fell into desuetude, till it was rediscovered by Ambrose Paré, in the 16th century.

LIGHT is the subject of the science of Optics (q. v.). We have just notice its principal phenomena, and the hypotheses advanced to explain them. Every one knows that light diverges from a luminous centre in all directions, and that its transmission in any direction is straight. It travels with great velocity, which was first ascertained, by observations on the eclipses of Jupiter's satellites, to be 195,000 English miles in one second. Shadows (q. v.) are a result of its straight transmission; and it follows from its diverging in all directions from a luminous centre, that its intensity diminishes inversely as the square of the distance from the centre. When it falls on the surfaces of bodies, it is reflected from them, regularly or irregularly, totally or partially, or is partly or wholly transmitted or refracted through them. The phenomena of the reflection and of the refraction of light are treated of respectively under the heads *Catoptrics* (q. v.) and *Diotrics* (q. v.). The facts of observation on which catoptrics is founded are two: 1. In the reflection of light, the incident ray, the normal to the surface, and the reflected ray are in one plane; 2. The angle of reflection is equal to the angle of incidence. Similar to these are the physical laws on which diotrics is founded. When a ray of homogeneous light is incident on a refracting surface, 1. The incident and refracted ray lie in the same plane as the normal at the point of incidence, and in opposite sides of it; 2. The sine of the angle

of incidence, whatever that angle may be, bears, to the angle of refraction, a ratio dependent only on the nature of the media between which the refraction takes place, and on the nature of the light. In stating these laws, we have hinted at light being of different kinds. At one time, it was not supposed that colour had anything to do with light; now, there is no serious dispute but that there are lights of different colours (see CHROMATICS and SPECTRUM), with different properties, though obeying the same general laws. Among the most striking phenomena of light are those treated of under the head POLARIZATION (q. v.). Next to these in interest are the phenomena of double refraction. See REFRACTION, DOUBLE. For an account of the chief chemical properties of light, see PHOTOGRAPHY and SPECTRUM. See also, for phenomena not noticed above, the articles ABBERRATION, DIFFRACTION, DISPERSION, INTERFERENCE.

Two hypotheses have been advanced to explain the different phenomena of light, viz. the theory of emission, or the corpuscular theory, and the theory of vibration, or the undulatory theory. According to the former, light is an attenuated imponderable substance, whose colours depend on the velocity of its transmission. It regards reflection as analogous to the rebounding of elastic bodies; while, to explain refraction, it assumes that there are interstices in transparent bodies, to allow of the passage of the particles of light, and that these particles are attracted by the molecules of bodies—their attraction combining with the velocity of the particles of light to cause them to deviate in their course. The undulatory theory assumes that light is propagated by the vibrations of an imponderable matter termed Ether (q. v.). On this view, light is somewhat similar to sound (see INTERFERENCE). Newton was the author of the former theory, and Huyghens may be regarded as the author of the latter. The theories were long rivals, but now no doubt remains that the theory of undulations has triumphed over the other. Its soundness may be said to rest on similar evidence to that which we have for the theory of gravitation: it had not only satisfactorily accounted for all the phenomena of light, but it has been the means of discovering new phenomena. In fact, it has supplied the philosopher with the power of prescience in regard to its subject. Those who wish to study the theory may advantageously consult its popular exposition by Young (*Lectures on Natural Philosophy*, London, 1845), and Lloyd's *Wave Theory of Light* (Dublin, 1856). The mathematical theory is very fully investigated in Airy's *Mathematical Tracts*.

LIGHT. In point of law, the right to light is one of the rights incident to the ownership of land and houses. When it is claimed in such a way as to interfere with a neighbour's absolute rights, it is called, in England and Ireland, an Easement (q. v.), and in Scotland a Servitude (q. v.). In England and Ireland, the right to light, as between neighbours, is qualified in this way, and forms a subject of frequent dispute in towns and populous places. If A build a house on the edge of his ground with windows looking into B's field or garden which is adjacent, B may next day, or any time within 20 years, run up a house or screen close to A's windows, and darken them all, for one has as good a right to build on his own land as the other. But if B allow A's house to stand 20 years without building, B is for ever after prevented from building on his own land so as to darken A's lights, for A then acquires a prescriptive right to an easement over B's lands. In the Roman law, a person was entitled not only to a servitude of light, but also of prospect; but in this country the

right of prospect, or of having a fine view, is not recognised by the law, except so far that the lights, after 20 years, must not be sensibly darkened. In Scotland, a servitude of light may exist in like manner, but it cannot be constituted except by special grant; whereas in England, if nothing is said, the right is acquired by prescription, or mere lapse of time. In Scotland, a neighbour, B, may, after 20 years, or any distance of time, build on his own land, and darken A's windows, provided he do not act wantonly, emulously, or so as to cause a nuisance.

LIGHTER, a large flat-bottomed barge or boat, usually propelled or guided by two heavy oars, and used for conveying merchandise, coals, &c., between ships and portions of the shore they cannot reach by reason of their draught.

LIGHTFOOT, JOHN, one of the earlier Hebrew scholars of England, was born in 1602 at Stoke-upon-Trent, in Staffordshire. He studied at Christ's College, Cambridge, and, after entering into orders, became chaplain to Sir Rowland Cotton, who, being himself a good Hebrew scholar, inspired L. with a desire to become one also. In 1627, appeared his *Brubhim, or Miscellanies Christian and Judaical*, which were dedicated to Sir Rowland, who, in 1631, presented him to the rectory of Ashley in Staffordshire. Subsequently, he removed to London, that he might have better opportunities for the prosecution of his favourite study; and in 1642 he was chosen minister of St Bartholomew's, to the parishioners of which he dedicated his *Handful of Gleanings out of the Book of Eccodus* (London, 1643). His most important work is *Horus Hebraice et Talmudice*, &c. (Cambridge, 1648), recently re-edited by R. Gandell (4 vols. Oxford, 1859). L. was one of the Assembly of Divines who met at Westminster in 1643, and in the debates that took place there, betrayed a decided predilection for the Presbyterian form of church government. In the same year, he was chosen Master of Catharine Hall, Cambridge, and in 1655 vice-chancellor of the university. At the Restoration, he complied with the terms of the Act of Uniformity. He died at Ely, December 6, 1675. At his death, he was engaged on a *Harmony*. The first collected edition of L.'s works was published in 1694, in 2 vols. folio; the best, by the Rev. J. Pitman, in 1822—1825, in 13 vols. L. was a very learned Hebraist for his time, but he was not free from the unscientific crotchets of the period, holding, for example, the inspiration of the vowel-points, &c. He has done good service to theology by pointing out and insisting upon the close connection between the Talmudical and Midrashic writings and the New Testament, which, to a certain extent, is only to be understood by illustrations from the anterior and contemporaneous religious literature.

LIGHT-HOUSE, a building on some conspicuous point of the sea-shore, from which a light is exhibited at night as a guide to mariners. Light-houses are of great antiquity, but they were long of an imperfect kind, and only in recent times have the systems of lighting them been perfected. The most celebrated light-house in ancient times was that erected on the island of Pharos, at Alexandria, 280 a.c., from which Pharos came to be a general name for a light-house, and still subsists in the French *Phare*.

There is no surer test of the advance in civilisation of any maritime country, than an increase in the number of its light-houses. When we consider the amount of property constantly afloat around the shores of Britain, and the number of valuable lives at stake, it seems hardly possible to over-estimate the importance of those beacon-lights,

which supply, though, of course, in an extremely imperfect way, the want of the light of the sun. The light-houses of the United Kingdom now number, with harbour-lights, upwards of 400 stations, and include some of the finest specimens of engineering, such as Smeaton's Eddystone, Robert Stevenson's Bell Rock, Alan Stevenson's Skerryvore, and James Walker's Bishop Rock. As information will be found under their respective heads regarding some of these interesting works, we shall restrict ourselves in the following short memoir to the internal economy of light-houses, and the most approved means of producing a powerful light for the use of the mariner.

Catoptric or Reflecting System.—So recently as the latter part of last century, the sea-lights of Britain consisted of open coal-fires; but this imperfect means of illumination was replaced by reflectors having lamps in their foci. At first, these instruments consisted of small facets of mirror-glass fixed in a mould by means of cement; but reflectors of copper-plate faced with silver, and hammered to the proper form, and carefully polished, were afterwards introduced. The parabolic form (see fig. 1), as is well known, is the most correct for reflecting the light proceeding from the focus and falling upon its

Fig. 1.

surface into one beam of parallel rays. When a series of such reflectors are arranged close to each other round a cylinder in a light-house, they illuminate constantly, though not with equal intensity, the whole horizon. As the property of the parabolic reflector is to collect the rays incident upon its surface into one beam of parallel rays, it would be absolutely impossible, were the flame from which the rays proceed a mathematical point, to produce a light which would illuminate the whole of the horizon, unless there were an infinite number of reflectors. But as the radiant, instead of being a mathematical point, is a physical object, consisting of a flame of very notable size, the rays which come from the outer portion of the luminous cone proceed, after reflection, in such divergent directions, as to render it practically possible to light up, though unequally, the whole horizon. The divergence produced in this way by a burner of one inch in diameter, with a focal distance of four inches, is in the horizontal plane about $14^{\circ} 22'$. The whole horizon may thus be illuminated by reflectors.

If, for the purpose of distinction, it is desired to show a revolving light, then several of these reflectors are placed with their axes parallel to each other on each of the faces of a four-sided frame, which is made to revolve. In such a case, the mariner sees a light only at those times when one of the faces of the frame is directed towards him, but at all other times he is left in darkness. The rotation of the frame upon its axis thus produces

to his eye a succession of light and dark intervals, which enables him to distinguish it from the fixed light which is constantly in view in every azimuth. The distinction of a red light is best produced by using a chimney of red instead of white glass for each burner. The *flashing* or *scintillating* light, which is one of the most striking of all the distinctions, was first introduced by the late Mr Robert Stevenson, the engineer of the Northern Light-houses, in 1822, at Buchanness, in Aberdeenshire. The same engineer also introduced what has been called the *intermittent* light, by which a stationary frame with reflectors is instantaneously eclipsed, and is again as suddenly revealed to view by the vertical movement of opaque cylinders in front of the reflectors. The intermittent is distinguished from the revolving light, which also appears and disappears successively to the view, by the suddenness of the eclipses and of the reappearance, whereas in all revolving lights there is a gradual waxing and waning of the light.

Dioptric System.—Another method of bending the diverging rays proceeding from a lamp into such directions as shall be useful to the mariner, is that of *refraction*. If a flame be placed in the focus of a lens of the proper form, the diverging rays will be bent parallel to each other, so as to form a single solid beam of light. So early as 1750, a London optician proposed to grind the glass of the Eddystone Light-house to a lenticular form; but this proposal came to nothing, for the first light of the Eddystone consisted of a few wax-candles, placed upon a chandelier, without even so much as a reflector of any kind behind them. M. Augustin Fresnel was the first to propose and to introduce lenticular action into light-house illumination, by the adoption of the annular or built lens, which had been suggested as a burning instrument by Buffon and Condorcet. He also, in conjunction with Arago and Mathieu, used a large lamp having four concentric wicks. In order to produce a revolving light on the lenticular or dioptric system, a different arrangement was adopted from that which we have described for the catoptric system. The large lamp was now made a fixture, and four or more annular lenses were fitted together, so as to form a frame of glass which surrounded the lamp. When this frame is made to revolve round the lamp, the mariner gets the full effect of the lens whenever its axis is pointed towards him, but in all other positions there is darkness. In order to operate upon those rays of light which passed above the lens, a system of double optical agents was employed by Fresnel. These (see fig. 2) consisted of a pyramid of lenses, *a*, with mirrors, *b*, placed above at the proper angle for rendering the rays passing upwards parallel to those which came from the annular lens, *L*. But Fresnel did not stop here, for, in order to make the lenticular system suitable for fixed as well as revolving lights, he designed a new optical agent, to which the name of cylindrical refractor has been given. This consisted of cylindrical lenses, which were the solids that would be generated were the profile of an annular lens made to circulate round a vertical axis. The action of this instrument is obvious: the rays to spread naturally in the *h* while they suffer refraction in the *h*. The effect of this instrument is that a light of equal intensity all round and thus to form a better light than was formerly produced for fixed lenticular reflection. It is obvious, how description that the diverging ray not intercepted by the *h* which would have been expended in

LIGHT-HOUSE.

downwards in uselessly illuminating the light-room floor, were lost to the mariner; and in order to render these effective, Fresnel ultimately adopted the use of what has been called the internal or total reflection of glass; and here it is necessary to explain that one of the great advantages of the action by glass over reflection by metal is the smaller quantity of light that it absorbs. It has been ascertained that there is a gain of almost one-fourth (249) by employing glass prisms instead

and used in connection with the diagonal framing introduced by Mr Alan Stevenson, it may be said

Fig. 2.

of metallic reflectors for light-house illumination. Fresnel introduced, above and below the cylindric refracting hoop which we have described, certain separate glass prisms of triangular section, the first surface of each of which refracted to a certain extent any ray of light that fell upon it, while the second surface was placed at such an angle as to reflect, by what is called internal or total reflection, the ray which had before been refracted by the first surface; and the last or outer surface produced another refraction, which made the rays pass out parallel with those refracted by the central cylindric hoop. The light falling above the cylindric hoop was thus bent downwards, and that falling below was bent upwards, so as to be made horizontal and parallel with that proceeding from the hoop. Figs. 3 and 4 represent

in elevation and section this, which is the most perfect of Fresnel's inventions in light-house illumination, and when made of the rhomboidal form,

Fig. 4.

to be a perfect apparatus. In the figure, *p* show the prisms and *R* the cylindric refractor.

From what has already been stated, it will be readily seen that, in so far as regards fixed lights, which are required to illuminate the whole of the horizon with equal intensity, the dioptric light of Fresnel is a perfect instrument. But the case is otherwise as regards revolving lights, or those where the whole rays have to be concentrated into one or more beams of parallel rays. To revert to the parabolic reflector, it must be obvious (see fig. 1) that every ray which escapes past the lips of the reflector never reaches the eye of the mariner, while, if we return to the dioptric revolving light of Fresnel, we find that those rays which escape past the lens are acted on by two agents, both of which cause loss of light by absorption. The loss occasioned by the inclined mirrors (see fig. 2), and in passing through the pyramidal inclined lenses, was estimated by Fresnel himself at one-half of the whole incident rays. In order to avoid this loss of light, Mr Thomas Stevenson proposed, in 1849, to introduce an arrangement by which the use of one of these agents is avoided, and the employment of total reflection, which had been successfully employed by Fresnel for fixed lights, was introduced with great advantage for revolving lights.

'This effect may be produced by the combination

Fig. 5.

of an annular lens, *L* (fig. 5); a parabolic conoid, *a*, truncated at its parameter, or between that and its vertex; and a portion of a spherical mirror, *b*. The lens, when at its proper focal distance from the flame, subtends the same angle from it as the outer lips of the paraboloid, so that no ray of light coming from the front of the flame can escape being intercepted either by the paraboloid or the lens. The spherical reflector occupies the place of the parabolic conoid which has been cut off behind the parameter. The

flame is at once in the centre of the spherical mirror, and in the common focus of the lens and paraboloid. Let us now suppose, as represented in the figure, that the parabolic conoid is truncated at the parameter; the whole sphere of rays emanating from the flame may then be regarded as divided into two portions, viz., the hemisphere of front rays and the hemisphere of back rays. Part of the anterior hemisphere of rays is intercepted by the lens, and made parallel by its action, while the remainder is intercepted by the paraboloidal surface, and made parallel by its action. The rays forming the posterior hemisphere fall on the spherical mirror behind the flame, and are reflected forwards again, through the focus in the same lines, but in opposite directions to those in which they came, whence passing onwards, they are in part refracted by the lens, and the rest are made parallel by the paraboloid. The back rays thus finally emerge horizontally in union with the light from the anterior hemisphere. This instrument, therefore, fulfils the necessary conditions, by collecting the *entire sphere of diverging rays into one beam of parallel rays* without employing any unnecessary agents.

The description given above is for a metallic holophote; but where total reflection, or the most perfect system of illumination, is adopted, the front half of the rays is operated upon by totally reflecting prisms (*p, p*, fig. 6), similar in section to those

be readily seen by comparing fig. 7 and fig. 2, in the former of which, one agent is enabled to do the work of two agents in the latter, while total reflection, or that by which least light is lost, is substituted for metallic, by which one half of the whole incident rays are absorbed. The dioptric holophotal system, or that by which *total reflection is used as a portion of the revolving apparatus*, was first employed on a small scale in 1850 at the Horsburgh Light-house, and on the large scale in 1851, at North Ronaldsay in Orkney. Since that date, this system has been all but universally introduced into Europe and America.

Fig. 7.

Azimuthal Condensing Light.—The above is a description of the general principles on which light-houses are illuminated. In placing a light in some situations, regard, however, must be had to the physical peculiarities of the locality; the following two plans of Mr Thomas Stevenson may be cited as examples. In fixed lights of the ordinary construction, the light is distributed, as already explained, equally all round the horizon, and is well adapted for a rock or island situated in the middle of the ocean. But where it is only necessary to illuminate a narrow sound (fig. 8), it is obvious that the

Fig. 8.

requirements are very different. On the side next the shore, no light is required at all; across the sound, a feeble light is all that is necessary, because the distance at which it has to be seen is small, owing to the narrowness of the channel; while up (DC) and down (AA) the sound, the sea to be illuminated is of greater or lesser extent, and requires a corresponding intensity. If the light were made sufficiently powerful to answer for the greater distance, it would be greatly too powerful for the shorter distance across the sound. Such an arrangement would occasion an unnecessary waste of oil, while the light that was cast on the landward side would be altogether useless. Fig. 9 represents (in plan) the condensing light, by which the light proceeding from the flame is *allocated in the different azimuths in proportion to the distances at which the light requires to be seen by the mariner in those azimuths*. Let us suppose that the rays marked *a* require to be seen at the greatest distance down the sound, and those marked *b* to a somewhat smaller distance up the sound. In order to strengthen those arcs, the spare light proceeding landwards, which would otherwise be lost, is intercepted by portions of holophotes, B

Fig. 6.

applied by Fresnel for fixed lights; but instead of being curvilinear in the horizontal plane only, they are also curvilinear in the vertical plane, and thus produce, in union with an annular lens, a beam of parallel rays, similar to what is effected by the parabolic mirror (fig. 1). The rays proceeding backwards fall upon prisms, *ab, ab*, which produce two total reflections upon each ray, and cause it to pass back through the flame, so as ultimately to fall in the proper direction upon the dioptric holophote in front, so that the whole of the light proceeding from the flame is thus ultimately parallelised by means of the smallest number and the best kinds of optical agents. It is a remarkable property of the spherical mirror, *ab*, that no ray passes through it, so that an observer standing behind the instrument perceives no light, though there is nothing between him and the flame but a screen of transparent glass.

Where the light is produced by a great central stationary burner, the apparatus assumes the form (fig. 7) of a polygonal frame, which circulates round the flame, and each face of which produces a beam of parallel rays. Hence, when the frame revolves with uniform rapidity round the central flame, the mariner is alternately illuminated and left in darkness, according as the axis of the holophotes is pointed towards him or from him. The difference between the revolving light of Fresnel and the holophotal light, as it has been termed, will

and C, subtending spherical angles proportioned to the relative ranges and angular spaces of the arcs α and β . The portions of light thus intercepted

It has been called an apparent light, from its appearing to proceed from a flame on the rock, while the light in reality proceeds from the shore, about 650 feet distant, and is refracted by glass prisms placed on the beacon.

Source of Light.—Drummond Light.—The descriptions which have already been given have all had reference to the best means of employing a given light. Many attempts have from time to time been made to increase the power of the radiant itself—such as combustion of the limeball, when exposed to a flow of oxygen and hydrogen gas. When this source of light is placed in the focus of a parabola, as was proposed by Lieutenant Drummond, a very intense beam of parallel rays is produced. The difficulty of maintaining continuous combustion has hitherto prevented its adoption in light-houses, although recent improvements have rendered this method more feasible than formerly.

Magneto-electric Light.—The electric light discovered by Dr Faraday, and recently adapted to light-house purposes by Professor Holmes, has lately undergone careful trials, under the auspices of the Trinity House of London. Although it is understood that sanguine hopes are entertained of its being rendered practically efficient, it has not yet been brought to that state of perfection which would warrant its general adoption.

Gas.—The uncertainty and other objections attending the manufacture and use of gas in remote and inaccessible places, have as yet prevented its adoption at light-house stations, but it has been successfully used at many harbour-lights.

Oil.—The oil which is now employed in Great Britain is that which goes by the name of *colza*, and the quantities annually consumed by the Northern Light-houses may be stated at 40 gallons for an argand one inch in diameter, and 800 gallons for the four-wick burner, which is used in dioptric lights of the first order.

Visibility of Lights.—The distance at which any light can be seen, of course depends on the height of the tower, and varies with the state of the atmosphere. The greatest recorded distance at which an oil-light has been visible is that of the holophotal light of Allepey at Travancore, which has been seen from an elevated situation at a distance of 45 miles. The holophotal revolving light at Baccalieu, in Newfoundland, is seen every night in clear weather at Cape Spear—a distance of 40 nautical miles.

Power of Light-house Apparatus.—The reflector (25 inches diameter) used in the Northern Light-houses, with a burner of one inch diameter, has been estimated as being equal to about 360 argand flames. The cylindric refractor, used in fixed lights, with a 4-wick burner, has in like manner been estimated at 250; while the annular lens employed in revolving lights, with the same burner, is equal to about 3000 argand flames.

Administration.—The light-houses of the United Kingdom are managed by the three following boards: viz., the English, by the Trinity House of London; the Scotch, by the Commissioners of Northern Light-houses; and the Irish, by the Ballast Board of Dublin. The Merchant Shipping Act of 1854 provides that the Scotch and Irish boards shall receive the sanction of the Trinity House before the erection of new light-houses; while all the three must receive the sanction of the Board of Trade both as to new lights and the expenditure of their funds, the source of which is a passing toll on the shipping.

Fig. 9.

are parallelised by the holophotes, and fall upon the prisms α , α , and β , β , respectively, which again refract them in the horizontal plane only; and, after passing through focal points (independent for each prism), they emerge in separate equal beams, and diverge through the same angles as α and β respectively. In this way, the light proceeding up and down the sound is strengthened in the required ratio by utilising in the manner we have described the light, which would otherwise have been lost on the land. These instruments were first introduced at three sound lights in the west of Scotland, in 1857, where apparatus of a small size, combined with a small burner, was found to produce in the only directions in which great power was required, beams of light equal to the largest class of apparatus and burner. The saving thus effected in oil, &c., has been estimated at about £400 or £500 per annum.

Apparent Light.—At Stornoway Bay, the position of a sunk rock has been sufficiently indicated by means of a beam of parallel rays thrown from the shore upon certain optical apparatus fixed in the top of a beacon erected upon the rock itself. By

Fig. 10.

means of this plan (vide fig. 10), the expense of erecting a light-house on the rock itself has been saved, and all the purposes of the mariner served.

LIGHTNING (Fr. *éclair*, Ger. *Blitz*), the name given to the sudden discharge of electricity between one group of clouds and another, or between the clouds and the ground. It is essentially the same, though on a much grander scale, as the spark obtained from an electric machine. Clouds charged with electricity are called thunder-clouds, and are easily known by their peculiarly dark and dense appearance. The height of thunder-clouds is very various: sometimes they have been seen as high as 25,700 feet, and a thunder-cloud is recorded whose height was only 89 feet above the ground. According to Arago, there are three kinds of lightning, which he names lightning of the first, second, and third classes. Lightning of the first class is familiarly known as forked-lightning (Fr. *éclair en zig-zag*). It appears as a broken line of light, dense, thin, and well defined at the edges. Occasionally, when darting between the clouds and the earth, it breaks up near the latter into one or two forks, and is then called bifurcate or trifurcate. The terminations of these branches are sometimes several thousand feet from each other. On several occasions, the length of forked-lightning has been tried to be got at trigonometrically, and the result gave a length of several miles. Lightning of the second class is what is commonly called sheet-lightning (Ger. *Flächenblitz*). It has no definite form, but seems to be a great mass of light. It has not the intensity of lightning of the first class. Sometimes it is tinged decidedly red, at other times, blue or violet. When it occurs behind a cloud, it lights up its outline only. Occasionally, it illumines the world of clouds, and appears to come forth from the heart of them. Sheet-lightning is very much more frequent than forked-lightning. Lightning of the third kind is called ball-lightning (Fr. *globes de feu*, Ger. *Kugelblitz*). This so-called lightning describes, perhaps, more a meteor, which, on rare occasions, accompanies electric discharge, or lightning proper, than a phenomenon in itself electrical. It is said to occur in this way: After a violent explosion of lightning, a ball is seen to proceed from the region of the explosion, and to make its way to the earth in a curved line like a bomb. When it reaches the ground, it either splits up at once, and disappears, or it rebounds like an elastic ball several times before doing so. It is described as being very dangerous, readily setting fire to the building on which it alights; and a lightning-conductor is no protection against it. Ball-lightning lasts for several seconds, and, in this respect, differs very widely from lightning of the first and second classes, which are, in the strictest sense, momentary.

The thunder (Fr. *tonnerre*, Ger. *Donner*) which accompanies lightning, as well as the snap attending the electric spark, has not yet been satisfactorily accounted for. Both, no doubt, arise from a commotion of the air brought about by the passage of electricity; but it is difficult to understand how it takes place. Suppose this difficulty cleared, there still remains the prolonged rolling of the thunder, and its strange rising and falling to account for. The echoes sent between the clouds and the earth, or between objects on the earth's surface, may explain this to some extent, but not fully. A person in the immediate neighbourhood of a flash of lightning hears only one sharp report, which is peculiarly sharp when an object is struck by it. A person at a distance hears the same report as a prolonged peal, and persons in different situations hear it each in a different way. This may be so far explained. The path of the lightning may be reckoned at one or two miles in length, and each point of the path is the origin of a separate sound. Suppose, for the sake of simplicity, that the path is a straight line, a person at the extremity of this line must hear a prolonged report;

for though the sound originating at each point of the path is produced at the same instant, it is some time before the sound coming from the more distant points of the line reaches the ear. A person near the middle of the line hears the whole less prolonged, because he is more equidistant from the different parts of it. Each listener in this way hears a different peal, according to the position he stands in with reference to the line. On this supposition, however, thunder ought to begin at its loudest, and gradually die away, because the sound comes first from the nearest points, and then from points more and more distant. Such, however, it is well known, is not the case. Distant thunder at the beginning is just audible, and no more; then it gradually swells into a crashing sound, and again grows fainter, till it ceases. The rise and fall are not continuous, for the whole peal appears to be made up of several successive peals, which rise and fall as the whole. Some have attempted to account for this modulation from the forked form of the lightning, which makes so many different centres of sound, at different angles with each other, the waves coming from which interfere with each other, at one time moving in opposite directions, and obliterating the sound, at another in the same way, and then strengthening the sound, produced by each. Thunder has never been heard more than 14 miles from the flash. The report of artillery has been heard at much greater distances. It is said that the cannonading at the battle of Waterloo was heard at the town of Creil, in the north of France, about 115 miles from the field.

LIGHTNING-CONDUCTOR (Fr. *paratonnerre*, Ger. *Blitzableiter*). The principle of the lightning-conductor is, that electricity, of two conducting passages, selects the better; and that when it has got a sufficient conducting passage, it is disarmed of all destructive energy. If a person holds his hand near the prime conductor of a powerful electric machine in action, he receives long forked stinging sparks, each of which causes a very sensible convulsion in his frame. But if he holds in his hand a ball, connected with the ground by a wire or chain, the above sensation is scarcely, if at all, felt, as each spark occurs, for the electricity, now having the ball and wire passage to the ground, prefers it to the less conducting body. If, instead of a ball, a pointed rod were used, no sparks would pass, and no sensation whatever would be felt. The point silently discharges the prime conductor, and does not allow the electricity to accumulate in it so as to produce a spark; and the quantity passing at a time, even supposing the rod disconnected with the ground, is not sufficient to affect the nerves. If, for the prime conductor of the machine, we substitute the thunder-clouds; for the body, a building; for the convulsive sensation, as the evidence of electric power, heating and other destructive effects; for the ball, or rod, and wire, the lightning-conductor, we have the same conditions exhibited on a larger natural scale. It is easier, however, to protect a building from the attacks of lightning than the body from the electric spark, as the rod in the one case is a much better conductor, compared with the building, than it is compared with the body, and, in consequence, more easily diverts the electricity into it.

The lightning-conductor consists of three parts: the rod, or part overtopping the building; the conductor, or part connecting the rod with the ground; and the part in the ground. The rod is made of a pyramidal or conical form (the latter being preferable), from 8 to 30 feet in height, securely fixed to the roof or highest part of the building. Gay-Lussac proposes that this rod should consist, for the greater part of its length below, of

iron; that it should then be surmounted by a short sharp cone of brass; and that it should finally end in a fine platinum needle; the whole being riveted or soldered together, so as to render perfect the conducting connection of the parts. The difficulty of constructing such a rod has led generally to the adoption of simple rods of iron or copper, whose points are gilt, to keep them from becoming blunt by oxidation. It is of the utmost importance that the upper extremity of the rod should end in a sharp point, because the sharper the point the more is the electrical action of the conductor limited to the point, and diverted from the rest of the conductor. There is thus less danger of the electricity sparking from the conductor at the side of the building into the building itself. Were the quantity of the electricity of the clouds not so enormous, the pointed rod would prevent a lightning-discharge altogether; but even as it is, the violence of the lightning-discharge is considerably lessened by the silent discharging-power of the point previously taking place. According to Eisenlohr, a conical rod, 8 feet in height, ought to have a diameter at its base of 13.3 lines, and one of 30 feet a diameter of 26.6 lines.

The part of the lightning-conductor forming the connection between the rod and the ground, is generally a prismatic or cylindrical rod of iron (the latter being preferable), or a strap of copper; sometimes a rope of iron or copper wire is used. Iron wire improves as a conductor when electric currents pass through it; copper wire, in the same circumstances, becomes brittle. An iron rope is much better, therefore, for conducting than a copper one. Galvanised iron is, of all materials, the best for conductors. The conducting-rod ought to be properly connected with the conical rod either by riveting or soldering or both. Here, as at every point of juncture, the utmost care must be taken that there is no break in the conduction. The conducting-rod is led along the roof, and down the outside of the walls, and is kept in its position by holdfasts fixed in the building. There must be no sharp turns in it, but each bend must be made as round as possible. Considerable discussion has arisen as to the proper thickness for the conducting-rod. If it were too small, it would only conduct part of the electricity, and leave the building to conduct the rest, and it might be melted by the electricity endeavouring to force a passage through it as an insufficient conductor. The Paris Commission, which sat in 1823, gave the minimum section of an iron conductor as a square of 15 millimètres (about $\frac{3}{16}$ ths of an inch) in side, and this they considered quite sufficient in all circumstances. A rod of copper would need to be only $\frac{3}{16}$ ths of this, as copper conducts electricity about six times more readily than iron. This calculation is very generally followed in practice. In leading the conductor along the building, it should be kept as much apart as possible from masses of conducting matter about the building, such as iron beams, machinery, &c. These may form a broken chain of conductors communicating with the ground, and divert a portion of the electricity from the lightning-conductor. If such took place, then at each interruption electricity would pass in a visible and dangerous way, and the efficacy of the conductor would be lost. If the conductor cannot be properly insulated from these masses of metal, the necessary security is got by putting them in connection with the conductor, so as to form a part of it. Water-runs, leaden roofs, and the like, must, for this reason, all be placed in conducting connection with the conductor.

The portion of the lightning-conductor which is placed in the ground is no less worthy of attention

than the other two. Should the lower part of the conductor end in dry earth, it is worse than useless, for when the lightning, attracted by the prominence and point of the upper rod, strikes it, it finds, in all likelihood, no passage through the unconducting dry earth, and, in consequence, strikes off to a part of the ground where it may easily disperse itself, and be lost. Wherever it is practicable, a lightning-conductor should end in a well or large body of water. Water is a good conductor, and having various ramifications in the soil, offers the best facility to the electricity to become dispersed and harmless in the ground. The rod, on reaching the ground, should be led down a foot and a half, or two feet, into the soil, and then turned away at right angles to the wall from the building in a horizontal drain filled with charcoal, for about from 12 to 16 feet, and then turned into the well so far that its termination is little likely to be left dry. Where a well cannot be made, a hole 6 inches wide (wider, if possible) should be bored, from 9 to 16 feet, the rod placed in the middle of it, and the intervening space closely packed with freshly heated charcoal. The charcoal serves the double purpose of keeping the iron from rusting, and of leading away the electricity from the rod into the ground.

Lightning-conductors, when constructed with care, have been proved beyond a doubt to be a sufficient protection from the ravages of lightning. The circle within which a lightning-conductor is found to be efficacious, is very limited. Its radius is generally assumed to be twice the height of the rod. On large buildings, it is therefore necessary to have several rods, one on each prominent part of the building, all being connected so as to form one conducting system. In ships, a rod is placed on every mast, and their connection with the sea is established by strips of copper inlaid in the masts, and attached below to the metal of or about the keel.

LIGHTNING-PRINTS are appearances sometimes found on the skin or clothing of men or animals that are either struck by lightning, or are in the vicinity of the stroke, and currently believed to be photographic representations of surrounding objects or scenery. The existence of such prints appears, from a theoretical point of view, highly improbable, as the essential conditions of forming a photographic image are wanting; still, several apparently well-authenticated instances have been recorded, which have led scientific authorities to give at least partial credence to them. One or two instances may serve to give a general idea of what are meant by lightning-prints. At Candelaria (Cuba), in 1828, a young man was struck dead by lightning near a house, on one of the windows of which was nailed a horse-shoe; and the image of the horse-shoe was said to be distinctly printed upon the neck of the young man beneath the right ear. On the 14th of November 1830, lightning struck the Château of Benattonnière, in La Vendée; at the time, a lady happened to be seated on a chair in the salon, and on the back of her dress were printed minutely the ornaments on the back of the chair. In September 1857, a peasant-girl, while herding a cow in the department of Seine-et-Marne, was overtaken by a thunder-storm. She took refuge under a tree; and the tree, the cow, and herself were struck with lightning. The cow was killed, but she recovered, and on loosening her dress for the sake of respiring freely, she saw a picture of the cow upon her breast. These anecdotes are typical of a great mass of others. They tell of metallic objects printed on the skin; of clothes, while being worn, receiving impressions of neighbouring objects; or of the skin

being pictured with surrounding scenery or objects, during thunder-storms. One object very generally spoken of as being printed is a neighbouring tree. This may be accounted for by supposing that the lightning-discharge has taken place on the skin in the form of the electric brush (see *ELECTRICITY*), which has the strongest possible resemblance to a tree, and that this being in some way or other imprinted on the skin, has led observers to confound it with a neighbouring tree. Of other prints, it would be difficult to give a satisfactory account. However, observers have done something in imitation of them. It has been shewn, for instance, by German observers, that when a coin is placed on glass, and a stream of sparks poured on it from a powerful electrical machine, on the glass being breathed upon, after its removal, a distinct image of the coin is traced out by the dew of the breath. Mr Tomlinson, by interposing a pane of glass between the knob of a charged Leyden jar and that of the discharging-tongs, obtained a perfect *breath-figure* of the discharge on each side of the glass, which bore the most striking resemblance to a tree. With all due allowance for the probable printing-power of lightning, the accounts given of it, in most cases, bear the stamp of exaggeration; and such of them as have been inquired into have been found to dwindle to a very small residuum of fact, in which there remained little that was wonderful.

LIGHTS, USE OF, IN PUBLIC WORSHIP, a practice which prevailed in the Jewish (Exodus xxv. 31—39) and in most of the ancient religions, and which is retained both in the Roman and in the Oriental churches. The use of lights in the night-services, and in subterranean churches, such as those of the early Christians in the catacombs, is of course easily intelligible; but the practice, as bearing also a symbolical allusion to the 'Light of the World' and to the 'Light of Faith,' was not confined to occasions of necessity, but appears to have been from an early time an accompaniment of Christian worship, especially in connection with the sacraments of baptism and the eucharist. The time of the service in which lights are used has varied very much in different ages. St Jerome speaks of it only during the reading of the gospel; Amalaricus, from the beginning of the mass till the end of the gospel; Isidore of Seville, from the gospel to the end of the canon; and eventually it was extended to the entire time of the mass. In other services, also, lights have been used from an early period. Lighted tapers were placed in the hand of the newly baptised, which St Gregory Nazianzen interprets as emblems of future glory. Indeed, in the Roman Catholic Church, the most profuse use of lights is reserved for the services connected with that sacrament. The usage of blessing the Paschal Light is described elsewhere. See **HOLY WEEK**. The material used or lights in churches is either oil or wax, the latter in penitential time, and in services for the dead, being of a yellow colour. In the Anglican Church, candlesticks, and in some instances candles themselves, are retained in many churches, on the communion table, but they are not lighted. The retention of them is greatly favoured by the 'High Church' party, and much disapproved by the 'Low Church' or 'Evangelical' party. In the Presbyterian and Independent churches of Britain, America, &c., the symbolical use of lights and candlesticks is rejected as superstitious.

LIGNINE (derived from the Latin word *lignum*, wood) is the incrusting matter contained within the cellular tissue, which gives hardness to wood. Like cellulose, of which the cellular tissue is composed, it

is insoluble in water, alcohol, ether, and dilute acids, and its chief chemical characteristic is, that it is more readily soluble in alkaline liquids than cellulose. Its exact composition is uncertain, but it is known to consist of carbon, hydrogen, and oxygen, and to differ in its composition from cellulose in containing a greater percentage of hydrogen than is necessary to form water with its oxygen. When submitted to destructive distillation, it yields acetic acid; and that it is the source of the pyroligneous acid (which is merely crude acetic acid) obtained by the destructive distillation of wood, is proved by the fact, that the hardest woods (those, namely, which contain the greatest proportion of lignine) yield the largest amount of acid. Lignine is identical with the *matière incrustante* of Payen and other French botanists.

LIGNITE, fossil wood imperfectly mineralised, and retaining its original form and structure much more completely than the truly mineral *coals*, and therefore not improperly described as intermediate between peat and coal. *Brown coal*, *Surturbrand*, and *Jet*, are generally regarded as varieties of lignite. The fossil plants of lignite are always terrestrial: palms and coniferous trees are amongst them. Remains of terrestrial mammalia are also found in it.

LIGNUM RHODIUM, a kind of wood which occurs as an article of commerce, having a pleasant smell resembling the smell of roses. It is brought to Europe in strong, thick, and rather heavy pieces, which are cylindrical but knotty, and sometimes split. They are externally covered with a cracked gray bark; internally, they are yellowish, and often reddish in the heart. They have an aromatic bitterish taste, and, when rubbed, emit an agreeable rose-like smell. This wood comes from the Canary Islands, and is produced by two shrubby and erect species of *Convolvulus*, with small leaves, *C. scoparius* and *C. floridus*. It is the wood both of the root and of the stem, but the latter is rather inferior. An essential oil (*Oil of L. R.*), having a strong smell, is obtained from it by distillation, and is used for salves, embrocations, &c., and also very frequently for adulteration of oil of roses.—Besides this *L. R.* of the Canary Islands, an American kind is also a common article of commerce; it is produced by the *Amyris balsamifera*, a native of Jamaica, and yields an essential oil, very similar to the former. The *L. R.* of the Levant is now scarcely to be met with in commerce. It is the produce of *Liquidambar Orientale*. From this, however, the name has been transferred to the other kinds.

LIGNUM-VITÆ, the wood of *Guaiacum officinale* (nat. ord. *Zygophyllaceae*), and probably of some other species, natives of Jamaica and St Domingo. The hardness and exceeding toughness of the very useful wood was shewn by Professor Voigt to depend upon a very peculiar interlacing of the fibres. The heart-wood, which is the part used, is very dense and heavy, of a dark, greenish-brown colour, rarely more than 8 inches in diameter; the stem itself seldom reaches 18 inches in diameter, and grows to the height of about 30 feet. The wood is much valued for making the wheels of pulleys and other small articles in which hardness and toughness are required; large quantities are consumed in making the sheaves (see **PULLEY**) of ships' blocks. Besides these uses, the wood, when reduced to fine shavings or raspings, the bark, and also a greenish resin which exudes from the stem, are much used in medicine, being regarded as having powerful anti-syphilitic and anti-rheumatic properties. See **GUAIACUM**.

LIGNY, a village in Belgium, in the province of Namur, about 10 miles north-east of Charleroi, famous on account of the battle fought here by the French, under Napoleon, and the Prussians, under Blücher, 16th June 1815, the same day on which the French, under Marshal Ney, were engaged with the British, under Wellington, at Quatre-Bras. Napoleon had formed a plan for overpowering his antagonists in detail ere they could concentrate their forces; and contrary to the expectations both of Wellington and Blücher, began his operations by assailing the Prussians. The battle took place in the afternoon. The possession of the villages of L. and St Amand was hotly contested; but the Prussians were at last compelled to give way. The Prussians lost in this battle 12,000 men and 21 cannon; the French, 7000 men. A mistake prevented a corps of the French army, under Erlon, from taking the part assigned to it in the battle, and led to Ney's encountering the Belgians and British at Quatre-Bras (q. v.), instead of uniting his forces with those engaged against the Prussians at Ligny.

LIGULATE (Lat. *ligula*, a little tongue), a term used in Botany to describe a corolla of one petal split on one side, and spread out in the form of a tongue or strap, toothed at the extremity. This form of corolla is very common in the *Compositæ*, appearing in all the florets of some, as the dandelion, and only in the florets of the ray of others, as the daisy and aster. The term, however, is of general application.

LIGULE. See GRASSES.

LIGUORI, ALFONZO MARIA DE, a saint of the Roman Catholic Church, and founder of the order of Liguorians or Redemptorists. He was born of a noble family at Naples, 27th September 1696, and embraced the profession of the law, which, however, he suddenly relinquished for the purpose of devoting himself entirely to a religious life. He received priest's orders in 1725; and in 1732, in conjunction with twelve companions, founded the association which is now called by his name. See **LIGURIANS**. In 1762, he was appointed bishop of Sant' Agata dei Goti, in the kingdom of Naples, and his life as a bishop is confessed by Protestant as well as Catholic historians to have been a model of the pastoral character; but shrinking from the responsibilities of such an office, he resigned his see in 1776, after which date he returned to his order, and continued to live in the same simple austerity which had characterised his early life. Having survived his retirement twelve years, he died at Nocera dei Pagani, August 1, 1787, and was solemnly canonised in the Roman Catholic Church in 1839. L. is one of the most voluminous and most popular of modern Catholic theological writers. His works, which extend to seventy volumes 8vo, embrace almost every department of theological learning, divinity, casuistry, exegesis, history, canon law, hagiography, asceticism, and even poetry. His correspondence also is voluminous, but is almost entirely on spiritual subjects. The principles of casuistry explained by L. have been received with much favour in the modern Roman schools; and in that church his moral theology, which is a modification of the so-called 'probabilistic system' of the age immediately before his own, is largely used in the direction of consciences. See **PROBABILISM**. It would be out of place here to enter into a discussion of the exceptions which have been taken to certain portions of it on the score of morality, whether in reference to the virtue of chastity or to that of justice and of veracity. These objections apply equally to most of the casuists, and have often

been the subject of controversy. L.'s *Theologia Moralis* (8 vols. 8vo) has been reprinted numberless times, as also most of his ascetic works. The most complete edition of his works (in Italian and Latin) is that of Monza, 70 volumes. They have been translated entire into French and German, and in great part into English, Spanish, Polish, and other European languages.

LIGUORIANS, called also **REDEMPTORISTS**, a congregation of missionary priests founded by Liguori in 1732, and approved by Pope Benedict XIV. in 1759. Their object is the religious instruction of the people and the reform of public morality, by periodically visiting, preaching, and hearing confessions, with the consent and under the direction of the parish clergy. Their instructions are ordered to be of the plainest and most simple character, and their ministrations are entirely without pomp or ceremonial. The congregation was founded originally in Naples, but it afterwards extended to Germany and Switzerland. In the Austrian provinces they had several houses, and were by some represented as but establishments of the suppressed Jesuits under another name. Nothing, however, could be more different than the constitution and the objects of the two orders. Since the Restoration, and especially since the Revolution of 1830, the L. have effected an entrance into France, and several houses of the congregation have been founded in England, Ireland, and America; but their place is in great measure occupied by the more active congregation of the Lazarist or Vincentian Fathers, whose objects are substantially the same, and who are much more widely spread. See **VINCENT DE PAUL**, and **VINCENTIAN CONGREGATION**.

LIGURIAN REPUBLIC, the name given to the republic of Genoa in 1797, when, in consequence of the conquests of Bonaparte in Italy, it was obliged to exchange its aristocratic for a democratic constitution. See **GENOA**. The name was chosen because the Genoese territory formed the principal part of ancient Liguria.

LILAC (*Syringa*), a genus of plants belonging to the natural order *Oleaceæ*, and consisting of shrubs and small trees, with 4-cleft corolla, 2 stamens, and a 2-celled, 2-valvular capsule. The **COMMON LILAC** (*S. vulgaris*) is one of the most common ornamental shrubs cultivated in Europe and North America. It is a native of the north of Persia, and was first brought to Vienna by Busbecq, the ambassador of Ferdinand I., to whom we also owe the introduction of the tulip into European gardens. From Vienna it soon spread, so that it is now to be found half wild in the hedges of some parts of Europe. There are many varieties. The flowers grow in large conical panicles; are of a bluish 'lilac' colour, purple or white, and have a very delicious odour. The leaves are a favourite food of cantharides. The bitter extract of the unripe capsules has very marked tonic and febrifugal properties. The wood is fine-grained, and is used for inlaying, turning, and the making of small articles. A fragrant oil can be obtained from it by distillation. The **CHINESE LILAC** (*S. Chinensis*) has larger flowers, but with less powerful odour, and the **PERSIAN LILAC** (*S. Persica*) has narrower leaves. Both are often planted in gardens and pleasure-grounds. There are several other species.

LILIA'CEÆ, a natural order of endogenous plants, containing about 1200 known species. They are most numerous in the warmer parts of the temperate zones. They are mostly herbaceous plants, with bulbous or tuberous, sometimes fibrous roots;

rarely shrubs or trees. The shrubby and arborescent species are mostly tropical. The stem is simple, or branching towards the top, leafless or leafy. The leaves are simple, generally narrow, sometimes cylindrical, sometimes fistular. The flowers are generally large, with 6-cleft or 6-toothed perianth; and grow singly or in spikes, racemes, umbels, heads, or panicles. The stamens are six, opposite to the segments of the perianth; the pistil has a superior 3-celled, many-seeded ovary, and a single style. The fruit is succulent or capsular; the seeds packed one upon another in two rows. This order contains many of our finest garden, green-house, and hot-house flowers, as lilies, tulips, dog's-tooth violet, lily of the valley, tuberose, crown imperial and other fritillaries, hyacinths, *Gloriosa superba*; many species useful for food, as garlic, onion, leek, and other species of *Allium*, Asparagus, the Quamash or Biscuit Root (*Camassia esculenta*) of North America, the Ti (*Dracena terminalis* or *Cordylone Ti*) of the South Seas, &c.; many species valuable in medicine, as squill, aloe, &c.; and some valuable for the fibre which their leaves yield, as New Zealand Flax, and the species of Bowstring Hemp or *Sansevieria*.—This natural order has been the subject of a number of splendid works, among which may be particularly named Redoute's *Les Liliacées* (8 vols. Paris, 1802—1816).

LILLE (formerly L'ISLE, 'the island,' Flemish, *Ryssel*), an important manufacturing town and fortress in the north of France, chief town of the département du Nord, is situated on the Deule, in a level, fertile district, 140 miles north-north-east of Paris, and 62 miles south-east of Calais. The streets are wide, the squares imposing, and the houses, which are mostly in the modern style, well built. The principal buildings and institutions are the Medical School, the Lyceum, the Bourse, and the palace of Richebourg, now the Hôtel-de-Ville, in which is the school of art, with a famous collection of drawings by Raphael, Michael, and other masters. L. derives its name from that of the castle around which the town originally arose, and which from its position in the midst of marshes was called Isle. It was founded in 1007 by Baldwin, the fourth Count of Flanders, and has suffered greatly from frequent sieges. Of these, the most recent, and perhaps the most severe, took place in 1708 and 1792. On the former occasion, during the war of the Spanish Succession, the garrison capitulated to the allies, after a bombardment of 120 days; on the latter, the Austrians, after a terrific bombardment, were obliged to raise the siege. L. is the head-quarters of the third military division. It is also the seat of extensive and thriving manufactures. The goods principally manufactured are linen, hosiery, gloves, blankets, lace, and tulle. The town contains many spinning-mills, bleach-fields, sugar-refineries, distilleries, tanneries, dye-houses, &c. In the vicinity are numerous oil-mills, porcelain-factories, and glass and pottery works. Pop. 131,827.

LILLIPUT, the name of a fabulous kingdom described by Swift in *Gulliver's Travels*, of which the inhabitants are not greater in size than an ordinary man's finger. The term Lilliputian has come into common use as a designation of anything very diminutive.

LILLY, WILLIAM, an English astrologer, born at Diseworth, in Leicestershire, in 1602. Whilst yet a young man, he was employed as book-keeper by a merchant in London, who could not write, and on his employer's death, married his widow, with whom he obtained a fortune of £1000 sterling. He betook himself to the study of astrology, particu-

larly the *Arte Notoria* of Cornelius Agrippa, and soon acquired a considerable fame as a caster of nativities, and a predictor of future events. In 1634, he is said to have obtained permission from the Dean of Westminster to search for hidden treasure in Westminster Abbey, but was driven from his midnight work by a storm, which he ascribed to hellish powers. From 1644 till his death, he annually issued his *Mertinus Anglicus Junior*, containing vaticinations, to which no small importance was attached by many. In the Civil War, he attached himself to the parliamentary party, and was actually sent in 1648, with another astrologer, to the camp at Colchester, to encourage the troops, which service he performed so well that he received a pension for it, which, however, he only retained two years. Nevertheless, he made a small fortune by his 'art' during the Commonwealth, and was able to purchase an estate. After the Restoration, he was for some time imprisoned, on the supposition that he was acquainted with the secrets of the Republicans; but being set free, he retired to the country. He was again apprehended on suspicion of knowing something of the causes of the great fire of London in 1666. He died, 9th June 1681, at his estate at Herham. L. wrote nearly a score of works on his favourite subject. They are of no value whatever, except to illustrate the credulity or knavery of their author.

LILY, a genus of plants of the natural order *Liliaceae*, containing a number of species much prized for the size and beauty of their flowers. The perianth is bell-shaped, and its segments are often bent back at the extremity. The root is a scaly bulb, the stem herbaceous and simple, often several feet high, bearing the flowers near its summit.—The WHITE LILY (*L. candidum*), a native of the Levant, has been long cultivated in gardens, and much sung by poets. It has large, erect, pure white flowers, as much prized for their fragrance as for their beauty.—The ORANGE LILY (*L. bulbiferum*), a native of the south of Europe, with large, erect, orange-coloured flowers, is a well-known and very showy ornament of the flower-garden.—The MARTAGON or TURK'S CUP LILY (*L. Martagon*), a native of the south of Europe, and allied species with verticillate leaves and drooping flowers, are also common in gardens. The TIGER LILY (*L. tigrinum*) is a native of China, remarkable for the axillary buds on the stem; and some very fine species are natives of North America, as *L. superbum*, which grows in marshes in the United States, has a stem 6—8 feet high, and reflexed orange flowers, spotted with black; *L. Canadense*, &c. Several very fine species have been introduced from Japan, as *L. Japonicum*, *L. speciosum*, and *L. lancifolium*.—The bulbs of *L. Pomponium*, *L. Martagon*, and *L. Kamtschacense*, are roasted and eaten in Siberia. That of *L. candidum* loses its acridity by drying, roasting, or boiling; when cooked, it is viscid, pulpy, and sugary, and is eaten in some parts of the East.—Lilies are generally propagated by offset bulbs. A single scale of the bulb will, however, suffice to produce a new plant, or even part of a scale, of which skilful gardeners avail themselves.—The name lily is often popularly extended to flowers of other genera of the same order, and even of allied orders.

LILY, GIANTIC (*Dorothyanthus excolea*), of Australia, a plant of the natural order *Amaryllidaceae*, with flowering stem 10 or 14, sometimes 20 feet high, bearing at top a cluster of large crimson blossoms. The stem is leafy, but the largest leaves are near the root. This plant is found both on the mountains

LILY OF THE VALLEY—LIMBURG.

and the sea-coast of New South Wales. It is of splendid beauty. The fibre of its leaves has

been found excellent for ropes and for textile fabrics.

corrupted, in lat. 12° 3' S., and long. 77° 5' W. It is six miles distant from its port, on the Pacific, Callao, with which it is connected by a railway. Including its suburban villages, ten in number, it contains about 100,000 inhabitants. L. is of Spanish origin, and its generally magnificent public buildings entitle it to rank as the handsomest city of South America. At one time the grand *entrepôt* for the west coast of the continent, it still carries on a large trade, importing cottons, woollens, silks, hardware, wines, and brandy; and exporting silver, copper, bark, soap, vicuña wool, chinchilla skins, nitre, sugar, &c. The temperature is agreeable, averaging 68·1° in winter, and 77·6° in summer; and the climate is comparatively salubrious, abundant dews making up for the want of rain.

LIMA WOOD, a name of the dye-wood also called Pernambuco Wood, Nicaragua Wood, and Peach Wood, the heart-wood of *Copaifera echinata*; See BRAZIL WOOD. It is extensively used for dyeing red and peach-colour.

LIMAX and LIMACIDAE. See SLUG.

LIMBER is half the field-equipment of a cannon or howitzer. The one half consists of the carriage itself, with the gun; while the limber, a two-wheeled carriage, fitted with boxes for the field-ammunition of the piece, and having shafts to which the horses are harnessed, forms the remainder. At the back-part, the limber has a strong hook, to which, on the march, is attached the foot of the gun-carriage by a ring at A, in the figure under GUN-CARRIAGE (q. v.). This constitutes at once a four-wheeled frame, which, whilst easier for transport than a gun on two wheels only, has the advantage of keeping together the gun and its ammunition. In marching, the gun points to the rear; but in coming to action, the artillerymen, by a rapid evolution, wheel round, so that the gun points to the front. It is then *unlimbered*, or unhooked, and the limber conveyed far enough to the rear to be out of the way of the men working the piece. To *limber up* again, and retreat or pursue, is the work but of a few moments.

LIMBURG, an old province of Belgium, which, after having formed part of Belgium, France, Holland, and Austria, was, in 1839, divided between Belgium and Holland.—**BELGIAN LIMBURG**, or LIMBOURG, in the north-east of the kingdom, is separated from Holland by the Meuse up to lat. 51° 8' N., and thence by a line running east-north-east to the northern boundary of the kingdom. The surface of the province is flat, and a large portion of it is occupied by barren heath; but in the south and centre there is good arable land. There is excellent pasturage along the banks of the Meuse, and large herds of cattle and swine are here reared. The manufactures include soap, salt, pottery, paper, tobacco, straw-hats, beet-sugar, &c. The area of the province is 923 English square miles, and the population (1861) 195,319. The capital of the province is Hasselt (q. v.).

LIMBURG, a province of Holland, which also ranks as a duchy in the Germanic Confederation, forms the south-east corner of the kingdom, being contiguous to the Belgian province of the same name. Its surface is generally level, and the soil is poor, a great part of it consisting of moors and marshes. However, in the valleys of the Meuse and its chief tributaries, excellent crops of grain, hemp, flax, oil-seeds, &c., are raised, and cattle and sheep reared. There are many manufactures of gin, tobacco, soap, leather, paper, and glass. The capital is Maastricht (q. v.). Area, 844 English square miles; pop. (1861) 218,727.

Lily-Tree (*Doryanthes excelsa*).

been found excellent for ropes and for textile fabrics.

LILY OF THE VALLEY (*Convallaria*), a genus of plants of the natural order *Liliaceæ*, having terminal racemes of flowers; a white, bell-shaped, or tubular 6-cleft or 6-toothed perianth; a 3-celled germen, with two ovules in each cell, and a succulent fruit.—The species commonly known as the Lily of the Valley (*C. majalis*), the *Maiblume* or Mayflower of the Germans, grows in bushy places

Lily of the Valley (*C. majalis*).

and woods in Europe, the North of Asia, and North America, and has a leafless scape, with a raceme of small flowers turned to one side. It is a universal favourite, on account of its pleasing appearance, the fragrance of its flowers, and the early season at which they appear. It is therefore very often cultivated in gardens, and forced to earlier flowering in hothouses. Varieties are in cultivation with red, variegated, and double flowers. The berries, the root, and the flowers have a nauseous, bitter, and somewhat acrid taste, and purgative and diuretic effects. The smell of the flowers when in large quantity, and in a close apartment, is narcotic. Dried and powdered, they become a sternutatory. The esteemed *Eau d'or* of the French is a water distilled from the flowers.—Allied to Lily of the Valley is **SOLOMON'S SEAL** (q. v.).

LIMA, the capital of the republic of Peru, stands on the Rimac, from whose name its own is

LIMBUS (Lat. *limbus*, a border), the name assigned in Roman Catholic theology to that place or condition of departed souls in which those are detained who have not offended by any personal act of their own, but, nevertheless, are not admitted to the divine vision. They distinguish it into the *Limbus Patrum* and the *Limbus Infantium*. By the former name they understand the place of those just who died before the coming of the Redeemer, and of whom it is said (1 Peter iii. 19), that he preached to those spirits that were in prison. By the latter is meant the place or state of the souls of infants who die without baptism. See HELL. Regarding the nature of both these places of detention, great variety of opinion prevails in Roman Catholic schools. See Wetzer's *Kirchen-Lexicon*, art. 'Höllenfahrt Christi.'

LIME is the oxide of the metal Calcium (q. v.), and is known in chemistry as one of the alkaline earths. Its symbol is CaO , its equivalent is 28, and its specific gravity is 3.18. In a state of purity, it is a white caustic powder, with an alkaline reaction, and so infusible as to resist even the heat of the oxyhydrogen jet. See DRUMMOND LIGHT. It is obtained by heating pure carbonate of lime (as, for instance, Carrara marble or Iceland spar) to full redness, when the carbonic acid is expelled, and lime is left. Commercial lime, which is obtained by burning common limestone in a kiln, is usually very far from pure. This compound (CaO) is known as *quicklime*, or, from the ordinary method of obtaining it, as *burned lime*, to distinguish it from the *hydrate of lime*, or *slaked lime*, which is represented by the formula $\text{CaO.H}_2\text{O}$. On pouring water on quicklime, there is an augmentation of bulk, and the two enter into combination; and if the proportion of water be not too great, a light, white, dry powder is formed, and a great heat is evolved. On exposing the hydrate to a red heat, the water is expelled, and quicklime is left.

If quicklime, instead of being treated with water, is simply exposed to the air, it slowly attracts both aqueous vapour and carbonic acid, and becomes what is termed *air-slaked*, the resulting compound in this case being a powder which is a mixture (or possibly a combination) of carbonate and hydrate of lime.

Lime is about twice as soluble in cold as in boiling water, but even cold water only takes up about $\frac{1}{10}$ th of its weight of lime. This solution is known as *lime-water*, and is much employed both as a medicine and as a test for carbonic acid, which instantly renders it turbid, in consequence of the carbonate of lime that is formed being more insoluble even than lime itself. It must, of course, be kept carefully guarded from the atmosphere, the carbonic acid of which would rapidly affect it. If in the preparation of slaked lime considerably more water is used than is necessary to form the hydrate, a white semi-fluid matter is produced, which is termed *milk of lime*. On allowing it to stand, there is a deposition of hydrate of lime, above which is lime-water.

The use of lime in the preparation of mortars and cements is described in the articles on these subjects. Lime is also largely employed as a manure (see below), and in the purification of coal-gas, in the preparation of hides for tanning, for various laboratory processes (from its power of attracting water), &c. Its medicinal uses are noticed below.

The following are the most important of the salts of lime. *Sulphate of lime* (CaO.SO_3) occurs free from water in the mineral *anhydrite*, but is much more abundant in combination with two equivalents of water in *selenite*, and in the different varieties of *gypsum* and *alabaster*. See GYPSUM.

Carbonate of lime (CaO.CO_2) is abundantly present in both the inorganic and organic kingdoms.

In the inorganic kingdom, it occurs in a crystalline form in Iceland spar, Aragonite, and marble—in which it is found in minute granular crystals—while in the amorphous condition it forms the different varieties of limestone, chalk, &c. It is always present in the ashes of plants, but here it is, at all events, in part the result of the combustion of citrates, acetates, malates, &c., of lime. It is the main constituent of the shells of crustaceans and molluscs, and occurs in considerable quantity in the bones of man and other vertebrates. Carbonate of lime, held in solution by free carbonic acid, is also present in most spring and river waters, and in sea-water. Stalactites, stalagmites, tufa, and travertin are all composed of this salt, deposited from calcareous waters. Certain forms of carbonate of lime—the Portland and other oolites, some of the magnesian limestones, &c.—are of extreme value for building purposes, and the various uses of the finer Marbles (q. v.) are too well known to require comment.

There is a combination of lime with an organic acid, viz., oxalate of lime, which is of great importance in pathology as a frequent constituent of urinary calculi and sediments; for a description of it see OXALIC ACID.

The soluble salts of lime (or, more accurately speaking, of calcium) give no precipitate with ammonia, but yield a white precipitate (of carbonate of lime) with carbonate of potash or of soda. These reactions are, however, common to the salts of barium, strontium, and calcium. Solution of sulphate of lime produces no marked effect when added to a salt of calcium, but throws down a white sulphate with the other salts. The most delicate test for lime is oxalate of ammonia, which, even in very dilute neutral or alkaline solutions, throws down a white precipitate of oxalate of lime.

There are several compounds of phosphoric acid and lime, of which the most important is the *basic phosphate of lime*, sometimes termed *bone phosphate*, from its being the chief ingredient of bones. The basic phosphate is represented by the formula 3CaO.PO_5 , and not only occurs in bones, but also in the minerals apatite and phosphorite, and in the rounded nodules termed coprolites, which are found in the Norfolk crag. It forms $\frac{1}{4}$ th of the ash of well-burned bone, the remaining $\frac{3}{4}$ th being carbonate of lime. This ash is known as *bone-ash*, and is employed as a manure and in the preparation of phosphorus, &c.

The substance commonly designated as *chloride of lime* has been already described in the article BLEACHING POWDER.

Lime as Manure.—This mineral substance has been used for many centuries as a means of increasing the fertility of land. All crops require a certain amount, as is found by analysing the ash which remains after combustion. It is sometimes supplied, without previous preparation, in the form of marl and chalk, but in most cases is first calcined and reduced to a fine powder by slaking with water. The quantity of calcined lime applied varies from three to eight tons to the acre. The smaller quantity may be sufficient for light land containing little vegetable matter, while the larger may be required for strong land, or for land holding much organic matter in an inert state. The large quantity of lime applied shows that its manurial effect is due more to its producing a certain chemical action on the land, than to its affording nutriment to the crops. Lime promotes the decomposition of all kinds of vegetable matter in the soil, and, further, it corrects any acidity in the organic matter, and thus destroys those weeds which are favoured by such a condition of the soil. It assists in the

decomposition of certain salts whose bases form the food of plants, and in this way it may be said to digest or prepare their food. On certain kinds of land, the finer grasses do not thrive until the land has been limed, and in these cases its use becomes all-important. Lime is the only cure, too, that can be relied on for 'finger-and-toe' in turnips, and its use is, from this cause, becoming more general.

Lime-Compounds in Materia Medica.—Quicklime, in association with potash, either as the *Potassa cum calce*, or as *Vienna Paste*, is occasionally used as a caustic. *Lime-water*, mixed with an equal quantity or an excess of milk, is one of our best remedies for the vomiting dependent on irritability of the stomach. From half an ounce to two or three ounces may be thus taken three or four times a day. Its use as a constituent of Carron oil in burns is noticed in the article **LINIMENTS**. *Chalk*, or *carbonate of lime*, when freed from the impurities with which it is often associated, is used as a dusting-powder in moist excoriations, ulcers, &c.; and in the form of *chalk mixture* and *compound powder of chalk*, is a popular remedy in various forms of diarrhoea. A mixture of an ounce of precipitated carbonate of lime and a quarter of an ounce of finely powdered camphor, is sold as *Camphorated Oretaceous Tooth-powder*.

LIME (*Citrus acida*), a fruit similar to the Lemon (q. v.), but much smaller, being only about 1½ inch in diameter, and almost globular, with a thin rind, and an extremely acid juice. It is regarded by many botanists as a variety of the same species with the Citron and Lemon. The plant does not attain the magnitude of a tree, but is a shrub of about eight feet in height, with a crooked trunk, and many spreading prickly branches. It is a native of India and China, but has long been cultivated in the West Indies, the south of Europe, &c. In the West Indies, it is planted both for the sake of its fruit and for hedges. The fruit is used for the same purposes as the lemon; but its acid is by many reckoned more agreeable. Lime-juice is imported into Britain like lemon-juice for the manufacture of citric acid.—The Sweet Lime (*C. Limetta* of Riasso), cultivated in the south of Europe, appears to be a mere variety, probably the result of cultivation, with a sub-acid pulp.

LIME, or **LINDEN** (*Tilia*), a genus of trees of the natural order *Tiliaceae*, natives of Europe, the north of Asia, and North America. The species are very similar; graceful, umbrageous trees; with deciduous, heart-shaped, serrated leaves, and cymes or panicles of rather small yellowish flowers; each cyme or panicle accompanied with a large, oblong, yellowish, membranous bractee, with netted veins, the lower part of which adheres to the flower-stalk. The wood is light and soft, but tough, durable, and particularly suitable for carved work. It is much used by turners, and for making pill-boxes. The charcoal made of it is often used for tooth-powder, for medicinal purposes, for crayons, and for the manufacture of gunpowder. The use of the fibrous inner bark for making ropes, mats, and other plaited work, is noticed in the article **BARK**. It is also used as a healing application to wounds and sores, being very mucilaginous, and abounding in a bland sap. The leaves are in some countries used as food for cattle, but cows fed on them produce bad butter. The flowers have an agreeable odour, and abound in honey, much sought after by bees. The celebrated *Kowno Honey*, much valued for medicinal use and for making liqueurs, is the produce of great L. forests near Kowno, in Lithuania. The infusion and distilled water of the dried flowers are gently

sudorific and antispasmodic. The former is in France a popular remedy for catarrhs. The seeds abound in a fixed sweet oil.—The **EUROPEAN L.**, or **LINDER** (*T. Europæa*), often attains a large size, particularly in rich alluvial soils. Some botanists distinguish a small-leaved kind (*T. parvifolia* or *microphylla*) and a large-leaved (*T. grandifolia*) as different species;

Lime-Tree (*T. Europæa*).

others regard them as mere varieties. The **HOOPED** or **CAPUCHIN L.** is an interesting monstrous variety. The L.-tree is often planted for shade in towns; and the principal street of Berlin is called *Unter den Linden*, from the rows of L.-trees which line it. The L. is a very doubtful native of Britain, although indigenous on the continent from Scandinavia to the Mediterranean. In Britain, the L.-tree is generally propagated by layers.—The **AMERICAN L.** (*T. Americana*, or *T. glabra*), commonly called **BASSWOOD** in America, has larger leaves than the European species. It abounds on the shores of Lakes Erie and Ontario. Other species take its place in more western and more southern regions.

LIMERICK, an inland county of the province of Munster, in Ireland, separated by the Shannon on the N. from Clare, and bounded on the E. by Tipperary, on the S. by Cork, and on the W. by Kerry. Its extreme length is 35 miles, its breadth 54 miles; area, 1064 square miles, or 680,842 acres. Pop. in 1851, 208,684; in 1861, 170,983, of whom 164,878 were Roman Catholics, 5606 Protestants of the Established Church, and the rest Protestants of other denominations. The surface of L. is an undulating plain, which forms part of the central carboniferous limestone plain of Ireland. A mountainous district on the west belongs to the great coal-tract of Munster, but the coal is of an inferior quality, and is chiefly used for the burning of lime. Within a short distance of the city of Limerick is a quarry which produces a reddish-brown marble of fine quality, as well as a black marble of inferior value. More than one of the districts contains iron, copper, and lead ores; but at present, no mining operations are carried on. The soil in general is very fertile, especially the district called the **Golden Vale**, which comprises upwards of 150,000 acres; as also a portion of the left bank of the Shannon below Limerick. Of the entire acreage of the county, 528,876 acres are arable, and 121,101 unsuited to cultivation. In general, the soil is equally fitted for tillage and for pasture. In 1882, 200,614 acres were under crops of various kinds, only 410 being reported fallow.

In the same year, the number of horned cattle was 146,686, and of sheep 62,576. The national schools in 1861 were 177, attended by 30,413 pupils, of whom 16,862 were boys, and 15,551 girls.

The principal towns of L. are the city of that name, Newcastle, and Rathkeale. Of the secondary rivers, the Deel and the Maigue are the most important. The great highway of water-communication, however, is the Shannon itself, the navigation of which has been much improved, and in which the harbour of Foynes promises to form the nucleus of an extended foreign trade. L. communicates by railway with Dublin, Waterford, Cork, and Ennis. The population is chiefly occupied in agriculture, hardly any manufactures existing outside the city. L. anciently formed part of the territory of Thomond, the principality of the O'Briens. After the English invasion, it fell, through many vicissitudes, in great part to the Desmond Fitzgeralds—the confiscated estates of the last earl in L. containing no fewer than 96,165 acres. On the forfeitures after 1641 and 1690, it was parcelled out to new proprietors. L. is more than usually rich in antiquities, both ecclesiastical and civil, of the Celtic as well as of the Anglo-Norman period. There were at one time nearly 40 religious foundations of the O'Briens alone, and the ruins of about 100 castles are still in existence. The ecclesiastical remains of Adare are exceedingly interesting, two of the ancient churches having been restored, one as the Protestant, the other as the Catholic parish church. Two other monastic ruins, in very good preservation, form a group of ecclesiastical remains hardly surpassed, in number and picturesqueness, even in the most favoured districts of the midland and northern counties of England.

LIMERICK, city, capital of the county just described, is situated on the river Shannon, 120 miles west-south-west from Dublin, with which it is connected by the great Southern and Western Railway. Pop. in 1851, 53,448; in 1861, 44,626, of whom 39,689 were Roman Catholics; 3934 Protestants of the Established Church, and the rest Protestants of other denominations. L. is a parliamentary and municipal borough, and returns two members to parliament. It occupies both sides of the Shannon, together with a tract called King's Island, which lies on a bifurcation of the river; and is divided into the English Town, the oldest part of the city (and connected with the extensive suburb called Thomond Gate, on the Clare side of the Shannon), and the Irish Town, which, within the present c., has extended on the south bank of the river into what is now the best part of L., called the New Town, or Newtown Pery, one of the handsomest towns in Ireland. L. is a place of great antiquity. From its position on the Shannon, it was long an object of desire to the Danes, who occupied it in the middle of the 9th c., and held possession till reduced to a tributary condition by Brian Boromhe, in the end of the 10th century. It was early occupied by the English, and in 1210, King John visited and fortified it. It was afterwards assaulted and partially burned in 1314 by Edward Bruce. Its later history is still more interesting. It was occupied by the Catholic party in 1641, but surrendered to Ireton in 1651. At the Revolution, it was the last stronghold of King James. Having been unsuccessfully besieged by William after the victory of the Boyne, it was regularly invested in 1691 by General Ginkel, and after a vigorous and brilliant defence of several weeks, an armistice was proposed, which led to the well-known 'Treaty of Limerick,' the alleged violation of which has been the subject of frequent and acrimonious controversy between political parties in Ireland. The

so-called 'Treaty Stone' still marks the spot, near Thomond Bridge, at the entrance of the suburb of Thomond Gate, where this treaty was signed. The modern city of L. is more tasteful in its general character, and possesses more of the appliances of commercial enterprise and social culture than most towns of Ireland. Its public buildings, especially the new Roman Catholic cathedral, and church of the Redemptorist order, are imposing, and in excellent taste. Its charitable and religious establishments are truly munificent for a provincial town. It possesses several national schools, as well as many other educational institutions. The Shannon at L. is still a noble river, navigable for ships of large burden. The docks and quays are on a very extensive and commodious scale; and the export trade, as well as the navigation of the river, is conducted with considerable enterprise. The inland navigation is by means of a canal to Killaloe, where it enters Lough Derg, and thence by the upper Shannon to Athlone, and by the Grand Canal, which issues from the Shannon at Shannon Harbour, to Dublin. The manufactures of L. are not very extensive, but some of them enjoy not merely an Irish, but an imperial reputation—such are the manufactures of lace, of gloves, and of fish-hooks. There are several iron-foundries, flour-mills, breweries, distilleries, and tanneries, and of late years, the ship-building trade has been considerably extended. In 1862, 1037 vessels, of 200,396 tons, entered and cleared the port.

LIMESTONE, the popular as well as technical name for all rocks which are composed in whole, or to a large extent, of carbonate of lime. Few minerals are so extensively distributed in nature as this, and in some form or other, limestone rocks occur in every geological epoch. Carbonate of lime is nearly insoluble in pure water, but it is rendered easily soluble by the presence of carbonic acid gas, which occurs in a variable quantity in all natural waters, for it is absorbed by water in its passage through the air as well as through the earth. Carbonate of lime in solution is consequently found in all rivers, lakes, and seas. In evaporation, water and carbonic acid gas are given off, but the carbonate of lime remains uninfluenced, becoming gradually concentrated, until it has supersaturated the water, when a precipitation takes place. In this way are formed the stalactites which hang icicle-like from the roofs of limestone caverns, and the stalagmites which rise as columns from their floors. Travertine (Tiber-stone), or calcareous tufa, is similarly formed in running streams, lakes, and springs, by the deposition of the carbonate of lime on the beds or sides, where it encrusts and binds together shells, fragments of wood, leaves, stones, &c. So also birds' nests, wigs, and other objects become coated with lime in the so-called petrifying wells, as that at Knaresborough. From the same cause, pipes conveying water from boilers and mines often become choked up, and the tea-kettle gets lined with 'fur.'

While water is thus the great store-house of carbonate of lime, very little of it, however, is fixed by precipitation, for in the ocean, evaporation does not take place to such an extent as to permit it to deposit, besides, there is five times the quantity of free carbonic acid gas in the water of the sea that is required to keep the carbonate of lime in it in solution. Immense quantities of lime are nevertheless being abstracted from the sea, to form the hard portions of the numerous animals which inhabit it. Crustacea, mollusca, zoophytes, and foraminifera are ever busy separating the lime particles of carbonate of lime from the water, and solidifying them, and so supplying the materials

for forming solid rock. It has been found that a large portion of the bed of the Atlantic between Europe and North America is covered with a light-coloured ooze, composed chiefly of the perfect or broken skeletons of foraminifera, forming a substance, when dried, which, in appearance and structure, closely resembles chalk. In tropical regions, corals are building reefs of enormous magnitude, corresponding in structure to many rocks in the carboniferous and other formations. The rocks thus organically formed do not always occur as they were originally deposited; denudation has sometimes broken them up to re-deposit them as a calcareous sediment. Great changes, too, may have taken place through metamorphic action in the texture of the rock, some limestones being hard, others soft, some compact, concretionary, or crystalline.

The chief varieties of limestone are: *Chalk* (q. v.); *Oolite* (q. v.); *Compact Limestone*, a hard, smooth, fine-grained rock, generally of a bluish-gray colour; *Crystalline Limestone*, a rock which, from metamorphic action, has become granular; fine-grained white varieties, resembling loaf-sugar in texture, are called *Saccharine* or *Statuary Marble*. *Magnesian Limestone* or *Dolomite* (q. v.) is a rock in which carbonate of magnesia is mixed with carbonate of lime. Particular names are given to some limestones from the kind of fossils that abound in them, as *Nummulite*, *Hippurite*, *Indusial*, and *Crinoidal* limestones; and to others from the formation to which they belong, as *Devonian*, *Carboniferous*, and *Mountain Limestones*.

LIMFIORD. See DENMARK.

LIMITATION, in English Law, is the limited time allowed to parties to commence their suits or actions, or other proceedings, so as to shorten litigation. In all civilised countries, some period is prescribed by statute (called statutes of limitations, or prescription) with this view, though few countries adopt the same limit, and Scotland differs much from England and Ireland in this point. In England, suits to recover land must generally be brought within twenty years, and to recover debts (including bills of exchange) and damages within six years. Actions for assault or battery must be brought within four years, and for slander within two years. In Scotland, Prescription is the word generally used for limitation, and actions to recover land generally must be brought within forty years, for many ordinary debts within three years, but for bills of exchange within six years. There are many other differences of detail. See Paterson's *Compendium of English and Scotch Law*.

LIMITED LIABILITY. See JOINT-STOCK COMPANIES.

LIMITS, THEORY OF. The importance of the notion of a *limit* in Mathematics cannot be over-estimated, as many branches of the science, including the differential calculus and its adjuncts, consist of nothing else than tracing the consequences which flow from this notion. The following are simple illustrations of the idea: The sum of the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$, approaches nearer and nearer to 2 as the number of terms is increased; thus, the several sums are $1\frac{1}{2}$, $1\frac{3}{4}$, $1\frac{7}{8}$, $1\frac{15}{16}$, &c., each sum always differing from 2 by a fraction equal to the last of the terms which have been added; and since each denominator is double of the preceding one, the further the series is extended, the less the difference between its sum and 2 becomes; also this difference may be made smaller than any assignable quantity—say, $\frac{1}{100,000}$, by merely extending the series till the last denominator becomes greater than 100,000 (for this, we need only take

18 terms; 3 terms more will give a difference less than $\frac{1}{1,000,000}$; and so on); again, the sum of the series can never be greater than 2, for the difference, though steadily diminishing, still subsists; under these circumstances, 2 is said to be the limit of the sum of the series. We see, then, that the criteria of a limit are, that the series, when extended, shall approach nearer and nearer to it, in value, and so that the difference can be made as small as we please. Again, the area of a circle is greater than that of an inscribed hexagon, and less than that of a circumscribed hexagon; but if these polygons be converted into figures of twelve sides, the area of the interior one will be increased, and that of the exterior diminished, the area of the circle always continuing intermediate in position and value; and as the number of sides is increased, each polygon approaches nearer and nearer to the circle in size; and as, when the sides are equal, this difference can be made as small as we please, the circle is said to be the limit of an equilateral polygon, the number of whose sides is increased indefinitely; or, in another form of words commonly used, 'the polygon approaches the circle as its limit, when its sides increase without limit,' or again, 'when the number of sides is infinite, the polygon becomes a circle.' When we use the terms 'infinite' and 'zero' in mathematics, nothing more is meant than that the quantity to which the term is applied is *increasing without limit*, or *diminishing indefinitely*; and if this were kept in mind, there would be much less confusion in the ideas connected with these terms. From the same cause has arisen the discussion concerning the possibility of what are called vanishing fractions (i. e., fractions whose numerator and denominator become zero simultaneously) having *real* values; thus $\frac{x^2 - 1}{x - 1} = \frac{0}{0}$, when $x = 1$; but by division we find that the fraction is equal to $x + 1$, which = 2, when $x = 1$. Now, this discussion could never have arisen had the question been interpreted rightly, as follows: $\frac{x^2 - 1}{x - 1}$ approaches to 2 as its limit, when x continually approaches 1 as its limit, a proposition which can be proved true by substituting successively 3, 2, $1\frac{1}{2}$, $1\frac{1}{3}$, $1\frac{1}{4}$, $1\frac{1}{5}$, &c., when the corresponding values of the fraction are 4, 3, $2\frac{1}{2}$, $2\frac{1}{3}$, $2\frac{1}{4}$, &c. The doctrine of limits is employed in the Differential Calculus (q. v.). The best and most complete illustrations of it are found in Newton's *Principia*, and in the chapters on *Maxima* and *Minima*, *Curves*, *Summation of Series*, and *Integration* generally, in the ordinary works on the Calculus.

LIMMA, an interval which, on account of its exceeding smallness, does not appear in the practice of modern music, but which, in the mathematical calculation of the proportions of different intervals, is of the greatest importance. The limma makes its appearance in three different magnitudes—viz., the great limma, which is the difference between the large whole tone and the small semitone, being in the proportion of 27 to 25; the small limma, which is the difference between the great whole tone and the great semitone, being in the proportion of 135 to 136; and the Pythagorean limma, which is the difference between the great third of the ancients (which consisted of two whole tones) and the perfect fourth, the proportion of which is as 256 to 243.

LIMNÆA (Gr. *limne*, a swamp), a genus of gasteropodous molluscs of the order *Pulmonata*, giving its name to a family, *Limnæada*, allied to *Helicida* (Snails), *Limacida* (Slugs), &c. The species

of this family are numerous, and abound in fresh waters in all parts of the world. They feed on vegetable substances. They all have a thin, delicate, horn-coloured shell, capable of containing the whole animal when retracted, but varying very much in form in the different genera; being produced into a somewhat elongated spire in the true *Limnææ* (POND-SNAILS), whilst in *Planorbis* the spire is coiled in the same plane, and in *Anodonta* (RIVER LIMPETS) it is limpet-shaped, with a somewhat produced and recurved tip. Many of the *Limnææ* have a habit of floating and gliding shell downwards at the surface of the water, as may readily be observed in a fresh-water aquarium, in which they are of great use in preventing the excessive growth of confervoids, and removing all decaying vegetable matter. They serve the same purpose in the economy of nature in lakes, ponds, and rivers, and furnish food for fishes. They are hermaphrodite. They deposit their eggs on stones or aquatic plants, enveloped in masses of a glairy substance. The development of the young mollusc may easily be watched in the aquarium, the membrane of the egg being perfectly transparent.

LIMNORIA, a genus of crustacea of the order *Isopoda*, containing only one known species, which, however, is important from the mischief it does to piers, dock-gates, and other wood-work immersed in the water of the sea, on the coasts of Britain, and of some parts of continental Europe. It is only about a sixth of an inch in length, of an ash-gray colour, with black eyes, which are composed of numerous ocelli, placed close together. The head is broad. The legs are short. The general appearance resembles that of a small wood-louse, and the creature rolls itself up in the same manner, if seized. The contents of the stomach consist of comminuted wood, and food is the object of the perforation of wood for which the *L.* is notable. Mr Stevenson found it very troublesome during the operations connected with the building of the Bell Rock Light-house. The piers at Southampton have suffered greatly from it. The kyanising of wood and other expedients have been resorted to, to prevent its ravages.

LIMOGES, capital of the department of Haute-Vienne, in France, and of the former province of Limousin, picturesquely situated on a hill in the valley of the Vienne, 67 miles south-east of Poitiers. It is an ancient city, and the seat of a bishop. It has a cathedral, begun in the 13th c., but still incomplete; a number of scientific and benevolent institutions and public buildings; considerable manufactures of druggets, of a kind of packthread known as Limoges, &c. It was the Augustorium of the Romans, in the country of the Galla Lemovices, and afterwards received the name of Lemovica, whence the present Limoges. Before the French Revolution, it had more than forty convents. Pop. 51,053.

LIMPET (*Patella*), a genus of gasteropodous molluscs, of the order *Cyclobranchiata*, the type of the family *Patellida*. In all this family, the shell is nearly conical, not spiral, and has a wide mouth, and the apex turned forwards. The animal has a large round or oval muscular foot, by which it adheres firmly to rocks, the power of creating a vacuum being aided by a viscid secretion. Limpets live on rocky coasts, between tide-marks, and remain firmly fixed to one spot when the tide is out, as their gills cannot bear exposure to the air, but move about when the water covers them; many of them, however, it would seem, remaining long on the same spot, which in soft calcareous rocks is found hollowed to their exact form. They feed on algae, which they eat by means

of a long ribbon-like tongue, covered with numerous rows of hard teeth; the COMMON *L.* (*Patella vulgaris*) of the British coasts having no fewer than 160 rows of teeth on its tongue, 12 in each row, 1920 teeth in all. The tongue, when not in use, lies folded deep in the interior of the animal. The gills are arranged under the margin of the mantle, between it and the foot, forming a circle of leaflets. The sexes are distinct.—The power of adherence of limpets to the rock is very great, so that unless surprised by sudden seizure, they are not easily removed without violence sufficient to break the shell. The species are numerous, and exhibit many varieties of form and colour. The Common *L.* is most abundant on the rocky coasts of Britain, and is much used for bait by fishermen; it is also used for food. Some of the limpets of warmer climates have very beautiful shells. A species found on the western coast of South America has a shell a foot wide, which is often used by the inhabitants as a basin.

LINACEÆ. See FLAX.

LINCOLN, ABRAHAM, sixteenth President of the United States of America, was born in Kentucky, February 12, 1809. His grandfather was an emigrant from Virginia; his father, a poor farmer, who, in 1816, removed from Kentucky to Indiana. In the rude life of the backwoods, L.'s entire schooling did not exceed one year, and he was employed in the severest agricultural labour. He lived with his family in Spencer County, Indiana, till 1830, when he removed to Illinois, where, with another man, he performed the feat of splitting 3000 rails in a day, which gave him the popular sobriquet of 'the Rail-splitter.' In 1834, he was elected to the Illinois legislature. At this period, he lived by surveying land, wore patched homespun clothes, and spent his leisure hours in studying law. He was three times re-elected to the legislature; was admitted to practise law in 1836; and removed to Springfield, the state capital. In 1844, he canvassed the state for Mr Clay, then nominated for president. Mr Clay was defeated, but the popularity gained by L. in the canvass secured his own election to congress in 1846, where he voted against the extension of slavery; and in 1854 was a recognised leader in the newly-formed Republican party. In 1855, he canvassed the state as a candidate for United States senator, against Mr Douglas, but without success. In 1856, he was an active supporter of Mr Fremont in the presidential canvass which resulted in the election of Mr Buchanan. In 1860, he was nominated for the presidency by the Chicago Convention over Mr Seward, who expected the nomination. The non-extension of slavery to the territories, or new states to be formed from them, was the most important principle of his party. There were three other candidates—Mr Douglas of Illinois, Northern Democrat; Mr Breckinridge of Kentucky, then vice-president, and since a general of the Confederate army, Southern Democrat; and Mr Bell of Tennessee, Native American. With this division, Mr Lincoln received a majority of votes over any of the other candidates, though a million short of an absolute majority; every Southern and one Northern state voted against him. He was installed in the president's chair 4th March 1861. His election by a sectional vote and on a sectional issue hostile to the South, was followed by the secession of 11 Southern states, and a war for the restoration of the union. As a military measure, he proclaimed, January 1, 1863, the freedom of all slaves in the rebel states; but this proclamation did not produce the immediate results which had been anticipated. His own views on the slavery question appear to

have been moderate, and in accordance with the constitution.

LINCOLN (called by the Romans *Lindum*; from which, with *Colonia* subjoined, comes the modern name), a city of England, capital of the county of the same name, a parliamentary and municipal borough and county of itself, is situated on the Witham, 140 miles north-north-west of London by railway. Built on the slope of a hill, which is crowned by the cathedral, the city is imposing in effect, and can be seen from a very considerable distance. It is very ancient, is irregularly laid out, and contains many interesting specimens of early architecture. The cathedral, one of the finest in England, is the principal building. It is surmounted by three towers, two of which, 180 feet in height, were formerly continued by spires of 101 feet. The central tower, 53 feet square, is 300 feet high. The interior length of the cathedral is 482, the width, 80 feet. The famous bell called Tom of Lincoln was cast in 1610, and was hung in one of the west towers of this edifice. It was broken up, however, in 1834, and, together with six other bells, was recast to form the present large bell and two quarter bells. The present bell, which hangs in the central tower, is 5 tons 8 cwt. in weight, and is 6 feet 10½ inches in diameter at the mouth. The style of the cathedral, though various, is chiefly Early English. L. also contains many other interesting religious edifices, among which are three churches, dating from before the Reformation, &c., numerous schools, and benevolent institutions. Several iron foundries, and manufactories of portable steam-engines and agricultural machines, as well as large steam flour-mills are in operation here, and there is an active trade in flour. Brewing and machine-making, with a trade in corn and wool, are also carried on. Two members are returned to the House of Commons for the city. Pop. (1861) 20,999.

L., under the Romans, was a place of some importance, and under the Saxons and the Danes, it preserved a good position. It was the seat of an extensive and important trade at the time of the Norman Conquest; but its advancement since that time has not been equally rapid. It contains some very interesting antiquities, as the Roman gate, the remains of the palace and stables of John of Gaunt, and the town-hall, which dates from the time of Henry VIII.

LINCOLNSHIRE, a maritime county of England, and, after Yorkshire, the largest in the country, is bounded on the N. by Yorkshire, and on the E. by the North Sea. Area, 1,775,457 statute acres; pop. 412,246. The coast, from the Humber—which separates the county from Yorkshire on the north—to the Waah, is almost uniformly low and marshy; so low, indeed, in one part—between the mouths of the Welland and the Nen—that the shore here requires the defence of an embankment from the inroads of the sea. L. has long been divided into three districts, or 'parts,' as they are called—viz., the Parts of Lindsey, an insular district, forming the north-eastern portion of L., and including the Wolds or chalk hills, which are about 47 miles in length by 6 miles in average breadth; the Parts of Kesteven, in the south-west; and the Parts of Holland, in the south-east, including the greater part of the fens. Chief rivers, the Trent, the Ancholme, the Witham, and the Welland. The surface is comparatively level, with the exception of the Wolds in the north-east. The soil, though very various, is on the whole very fertile. It includes tracts of grazing-ground unsurpassed in richness, and the 'warp-lands' (see WARPING) along the side of the Trent

produce splendid crops of wheat, beans, oats, and rape, without the aid of manure. No other county in England has finer breeds of oxen, horses, and sheep. Horncastle and Lincoln horse-fairs are frequented by French, German, Russian, and London dealers for the purpose of buying superior hunters and carriage-horses. The climate, though subject to strong westerly winds, is pretty much the same as that of the other central counties of England. Four members are returned to parliament.

LINCOLN'S INN, one of the four English Inns of Court, having exclusive power to call persons to the bar. It is so called because it belonged to the Earl of Lincoln in the reign of Edward II., and became an Inn of Court soon after his death in 1310. See INNS OF COURT.

LIND, JENNY. See GOLDSCHMIDT, MADAME.

LINDLEY, JOHN, a distinguished living botanist, was born in 1799 at Catton, near Norwich, where his father, who was the author of *A Guide to Orchard and Kitchen Gardens*, owned a large nursery garden. Botany seems to have early attracted his attention, as, in 1819, he published a translation of Richard's *Analyse du Fruit*, and in 1820, his *Monographia Rosarum* appeared. Amongst his most important works are his *Introduction to the Natural System of Botany* (1830); *Introduction to the Structure and Physiology of Plants* (2 vols. 1832); *Flora Medica* (1838); and *The Vegetable Kingdom* (1846), which is a standard work on the subject of classification, and is an expansion of his *Introduction to the Natural System*, which had previously (in 1836) been remodelled under the title of *A Natural System of Botany*. L. has done much to popularise the study of botany by the publication of his *Ladies' Botany*, *School Botany*, 'Botany' in the *Library of Useful Knowledge*, and the botanical articles as far as the letter R in the *Penny Cyclopædia*. In his *Theory of Horticulture*, which has passed through several editions, and in the well-known periodical, *The Gardener's Chronicle* (the horticultural department of which he has edited from its commencement in 1841), he has shewn the practical value of a knowledge of vegetable physiology in the common operations of the field and garden. In conjunction with Mr Hutton, he has published *The Fossil Flora of Great Britain*, which consists of descriptions and figures of all the fossil plants found in this country up to the time of the commencement of this publication in 1833. Our limited space prevents us from noticing his other works, or his numerous contributions to scientific transactions. In 1829, at the opening of the London University, he was appointed Professor of Botany, and he continued to discharge the duties of the chair till 1860, when he resigned. Since 1822, he has acted as assistant secretary to the Horticultural Society, and has not only edited their *Transactions and Proceedings*, but took an active part in the management of their gardens at Turnham Green to the date of their discontinuance. He is a Fellow of almost all the learned societies both at home and abroad.

LINDSAY, SIR DAVID, OF THE MOUNT, one of the best, and long the most popular of the older Scottish poets, was the son of David Lindsay of Garmylton in East Lothian, and of the Mount in Fife, whose grandfather was a natural son of Sir William Lindsay of the Byres. The poet is believed to have been born at the Mount about the year 1490, to have had his first training at the grammar-school of Cupar, and to have studied at the university of St Andrews from 1505 till 1509. He seems to have visited Italy in 1510. He returned to

Scotland before the winter of 1511, when he is found taking part in a play acted before the court of King James IV. In the following spring, he was appointed 'keeper' or 'usher' of the prince, who, when little more than a twelvemonth old, became King James V.; and his verses preserve some pleasing traces of the care and affection with which he tended the king's infant years. His wife, Janet Douglas, had long the charge of the royal apparel. In 1524, the court fell under the power of the queen-mother and the Douglasses, and L. lost his place; but four years afterwards, when the Douglasses were overthrown, L. was made one of the king's heralds. About 1530, he was knighted, and promoted to the office of Lion King at Arms. In this capacity he accompanied embassies to the courts of England, France, Spain, and Denmark. He appears to have represented Cupar in the parliaments of 1542 and 1543; and he was present at St Andrews in 1547, when the followers of the reformed faith called Knox to take upon himself the office of a public preacher. He died childless before the summer of 1555.

The first collection of L.'s poems appeared at Copenhagen about 1553. They were republished at Paris or Rouen in 1558; at London in 1566, 1575, and 1581; at Belfast in 1714; in Scotland in 1559, 1568, 1571, 1574, 1588, 1592, 1597, 1604, 1610, 1614, 1634, 1648, 1696, 1709, 1720, and 1776. This mere enumeration of editions might be enough to shew the great popularity which L. long enjoyed. For nearly two centuries, indeed, he was what Burns has since become—the poet of the Scottish people. His works were in almost every house, his verses on almost every tongue. Like Burns, he owed part of his popularity, no doubt, to his complete mastery of the popular speech. But, like Burns, L. would have been read in whatever language he chose to write. His verses shew few marks of the highest poetical power, but their merits otherwise are great. Their fancy is scarcely less genial than their humour, and they are full of good sense, varied learning, and knowledge of the world. They are valuable now, if for nothing else than their vivid pictures of manners and feelings. In the poet's own day, they served a nobler purpose, by preparing the way for the great revolution of the 16th century. It has been said that the verses of L. did more for the Reformation in Scotland than all the sermons of Knox. Like Burns, L. shot some of his sharpest shafts at the clergy. If his verse is much more open than the verse of Burns to the charge of licentiousness, it is to be remembered that he lived in a much coarser and looser age. The earliest and most poetical of his writings is *The Dreame*; the most ambitious, *The Monarchie*; the most remarkable in his own day, perhaps, was *The Satyre of the Thrie Estaitis*; but that which is now read with most pleasure, both for the charm of its subject and for its freedom from the allegorical fashion of the time, is *The Historie of Squer Meldrum*. The best edition of L.'s works is that of the late George Chalmers (Lond. 1806, 3 vols. 8vo); but there is ample room for a better. *The Booke and Register of Armes*, which L. compiled as Lion King at Arms in 1542, was printed in fac-simile at Edinburgh in 1822.

LINE, an expression used in the army to distinguish ordinary cavalry and infantry from the Guards, Artillery, and Engineers. It obviously takes its origin from the fact, that the troops in question constituted the usual 'line of battle.'

LINE, MATHEMATICAL, denotes a magnitude having only one dimension. Euclid defines it to be, 'that which has length without breadth.'

LINEAL DESCENT, the descent in a right line, as from father to son, grandson, &c.

LINEN AND LINEN MANUFACTURES, fabrics manufactured wholly from flax or lint (Lat. *linum*). The manufacture of linen has reached its greatest perfection in France and the Netherlands, where the stimulus to produce fine yarns (see **SPINNING**) for the lacemakers has given rise to such care and attention in the cultivation and preparation of flax, that in point of fineness of fibre they have been unequalled. Consequently, the linens of France, Belgium, and Holland have long enjoyed a well-deserved reputation, and in the article of lawn, which is the finest kind of linen-cloth made, the French are unrivalled. In the ordinary kinds of linen, our own manufactures are rapidly improving, and will soon equal in quality the productions of continental competitors. Those of Ireland, especially, are remarkable for their excellence, and this trade has become a very important one in that country; whilst in Scotland a large trade in the coarser and inferior kinds has located itself. The export of linen and linen yarns from the United Kingdom exceeds in value £6,000,000; and the amount produced for home-consumption may be reckoned at £5,000,000 more.

The chief kinds of linen manufactures, besides yarn and thread, which will be described under **SPINNING**, are: **LAWN** (Fr. *linon*), the finest of flax manufactures, formerly exclusively a French production, but very fine lawns are now made in Belfast, Armagh, and Warrington; **CAMBRIC** (q. v.); **DAMASK** (q. v.); **DIAPER** (q. v.). Of the finer plain fabrics, *Sheetings* are the most important in this country. The chief places of their manufacture are Belfast, Armagh, and Leeds. Common *Sheeting* and *Towelling* are very extensively manufactured in Scotland, particularly at Dundee, Kirkcaldy, Forfar, and Arbroath. *Ducks*, *Huckabacks*, *Osnaburghs*, *Crash*, and *Tick* (corrupted from *ticks* and *dekken*, Dutch for cover), are very coarse and heavy materials, some fully bleached, others unbleached, or nearly so. They are chiefly made in Scotland, the great seat of the manufacture being at the towns just mentioned, although much is made in the smaller towns and villages, also at Leeds and Barnsley in England. Some few varieties of velvet and velveteen are also made of flax at Manchester, and much linen-yarn is used as warp for other materials.

Linen is one of the most ancient of all textile manufactures, at least it is one of the earliest mentioned. The cerecloth, in which the most ancient mummies are wrapped, proves its early and very extensive use among the Egyptians. It formed also parts of the garments of the Hebrew as well as the Egyptian priests. Panopolis was the Belfast of the ancients, as, according to Strabo, it was there the manufacture of linen was chiefly conducted. The wonderful durability of linen is evidenced by its existence on mummies, and by the remarkable fact mentioned by the German writer, Seetzen, and referred to by Blumenbach, that he had found several napkins within the folds of the covering on a mummy which he unwrapped, and that he had them washed several times without injury, and used with great veneration 'this venerable linen, which had been woven more than 1700 years.' From the time of these ancient Egyptians up to the present period, the use of linen for clothing and other purposes has been continuous; and although the introduction and vast development of the cotton manufacture checked its consumption for a time, it has fully regained, and has indeed exceeded, its former proportions as one of our great staples.

LING (*Lota molva*), a fish of the family *Gadida*, abundant on most parts of the British coasts, and elsewhere throughout the northern seas, and in value almost rivalling the cod. In form, it is much more elongated than the cod, and even more than the hake, with which it agrees in having two dorsal fins and one anal fin, the anal and second dorsal long; but the genus differs in the presence of barbels, of which the L. has only one at the extremity of the lower jaw. The L. is generally three or four feet long, sometimes more, and has been known to weigh seventy pounds. The colour is gray, inclining to olive; the belly, silvery; the fins edged with white. The tail-fin is rounded. The gape is large, and the mouth well furnished with teeth. The L. is a very voracious fish, feeding chiefly on smaller fishes. It is also very prolific, and deposits its spawn in June, in soft oozy ground near the mouths of rivers. It is found chiefly where the bottom of the sea is rocky. Great numbers are caught in the same manner as cod, by hand-lines and long lines, on the coasts of Cornwall, the Hebrides, the Orkney and Shetland Islands, &c.; and are split from head to tail, cleaned, salted in brine, washed, dried in the sun, and sent to the market in the form of *Stock-fish*. They are largely exported to Spain and other countries. The air-bladders or *sounds* are pickled like those of cod. The liver also yields an oil similar to cod-liver oil, which is used for the supply of lamps in Shetland and elsewhere.—Other species of L. are found in the southern seas.—The *Burbot* (q. v.) is a fresh-water species of the same genus.

LINGA (a Sanscrit word which literally means a sign or symbol) denotes, in the sectarian worship of the Hindus, the *phallus*, as emblem of the male or generative power of nature. The Lings-worship prevails with the Saivas, or adorers of Siva (see Hindu Religion under INDIA). Originally of an ideal and mystical nature, it has degenerated into practices of the grossest description; thus taking the same course as the similar worship of the Chaldeans, Greeks, and other nations of the east and west. The manner in which the Lings are represented is generally inoffensive—the pistil of a flower, a pillar of stone, or other erect and cylindrical objects, being held as appropriate symbols of the generative power of Siva. Its counterpart is *Yoni*, or the symbol of female nature as fructified and productive. The Siva-Purāna names twelve Lings which seem to have been the chief objects of this worship in India.

LINGARD, JOHN, D.D., a member of a humble Roman Catholic family, was born at Winchester, February 1, 1771; and being destined for the priesthood of that church, was sent to the English College of Douai, in France, where he remained till that college, in common with most of the religious establishments of France, was broken up by the troubles of the Revolution. The recent Catholic Relief Bill enabling Catholics to open schools in England, the Douai community was transferred to Crookhall, and ultimately to Ushaw, in the county of Durham. L. continued attached to the college in its several migrations, although not always resident. In 1793, he accepted the office of tutor in the family of Lord Stourton; but in the following year he returned to complete his theological studies at Crookhall, where he entered into priest's orders, and in which he continued as professor of philosophy, prefect of studies, and vice-president, until 1810, when he was named president. In 1811, however, he accepted the humble cure of Hornby, near Lancaster, in which he continued to reside till his death, July 13, 1851. L.'s first important

work was the *Antiquity of the Anglo-Saxon Church* (8vo, 1806), reprinted in 1810, and afterwards, in a much enlarged edition (2 vols. 1845). This was but the pioneer of what became eventually the labour of his life—a *History of England* (6 vols. 4to), published at intervals, 1819–1825; and afterwards in 14 vols. 8vo, 1823–1831. This work, before the death of the author, had passed through six editions, the last of which (10 vols. 8vo) appeared in 1854–1855. From its first appearance, it attracted much attention, as being founded on original authorities and the result of much new research. It was criticised with considerable asperity in its polemical bearings; but the author, in his replies, displayed so much erudition, and so careful a consideration of the original authorities, that the result was to add materially to his reputation as a scholar and a critic. It won for itself a place as a work of original research, and although it bears unmistakable evidence of the religious opinions of the author, yet there is also evidence of a sincere desire to investigate and to ascertain the truth of history. In recognition of his great services, many honours were offered to him; and he received a pension of £300 from the crown in reward of his literary services. His remains were interred in his old college of St Cuthbert, at Ushaw.

LINGAYEN, a town of the island of Luzon, Philippine Islands (q. v.), on a bay of the same name. Pop. 23,063, who export rice and sugar.

LINIMENTS (from the Latin word *linire*, to besmear) may be regarded, in so far as their physical properties are concerned, as ointments having the consistence of oil, while, chemically, most of them are *soaps*—that is to say, compounds of oils and alkalies. In consequence of their slighter consistence, they are rubbed into the skin more readily than ointments. Among the most important of them are: *Liniment of Ammonia*, popularly known as *Hartshorn and Oil*, which is prepared by mixing and shaking together solution of ammonia and olive-oil, and is employed as an external stimulant and rubefacient to relieve neuralgic and rheumatic pains, sore throat, &c.: *Soap Liniment*, or *Opodeldoc*, the constituents of which are soap, camphor, and spirits of rosemary, and which is used in sprains, bruises, rheumatism, &c.: *Liniment of Lime*, or *Carron Oil*, which is prepared by mixing and shaking together equal measures of olive or linseed oil and lime-water; it is an excellent application to burns and scalds, and from its general employment for this purpose at the Carron iron-works, has derived its popular name: *Camphor Liniment*, consisting of camphor dissolved in olive-oil, which is used in sprains, bruises, and glandular enlargements, and which must not be confounded with *Compound Camphor Liniment*, which contains a considerable quantity of ammonia, and is a powerful stimulant and rubefacient: *Opium Liniment*, which consists of soap liniment and tincture of opium, and is much employed as an anodyne in neuralgia, rheumatism, &c.; and the *Simple Liniment* of the Edinburgh Pharmacopoeia, which is composed of four parts of olive-oil and one part of white wax, and is used to soften the skin and promote the healing of chaps.

LINKÖPING (old Norse *Longaköpungar*, later *Liongaköping*), one of the oldest towns in Sweden, capital of the län of the same name, is situated on the Stånga, which here flows into Lake Roxen, 110 miles south-west of Stockholm. It is regularly built, with fine market-places and public squares, but the houses are mostly of wood. L. has three churches, of which the cathedral—a Gothic edifice

of the 12th c., containing monuments of many illustrious personages—is one of the most beautiful in Sweden. It also possesses a library of 30,000 vols. Its trade is considerable. Pop. 5733. In old heathen times, L. was a place of sacrifice.

LINLITHGOW, or **WEST LOTHIAN**, a county in Scotland, is bounded on the N. by the Firth of Forth, having the counties of Mid-Lothian, Lanark, and Stirling on the E., S., and W. Its length, north to south, is 20 miles, and east to west 15 miles. Its area is 127 square miles, or 81,280 acres. The surface of the ground is irregular, but the hills are inconsiderable in height, the highest not being above 1000 feet. The climate is changeable, but healthy. The soil is very varied, and, except along the borders of the Firth, there is little land of first quality. In some of the high grounds there is good pasture, also a considerable breadth of unreclaimed moss. There are few streams of any note, the Almond and Avon being the principal. The minerals are of considerable value, yielding upwards of £22,000 yearly. The freestone used in building the Royal Institution, National Gallery, and other public buildings in Edinburgh, was got at Binny, near the county town. There are several collieries in full and profitable operation.

There are two royal burghs—Linlithgow, the county town, and Queensferry. The other principal towns are Bathgate and Borrowstounness. This county is intersected with railways, and the Edinburgh and Glasgow Union Canal, on which there is a great traffic in manure and minerals, traverses it for upwards of ten miles. The old valued rent was £6237. In 1811, the real rent was £88,745; and in 1862 it was, excluding railways and canals, £173,171.

The following are the agricultural statistics for 1857: Number of occupants of land, 443; acres under a rotation of crops, 50,547; of which there were 3737 acres of wheat, averaging 30 bushels 3 pecks per acre; 4653 barley, 33 bushels 3 pecks per acre; 11,990 oats, 34 bushels per acre; 5246 acres of turnips, averaging 14 tons 16 cwts. per acre; and 1666 acres of potatoes, 2 tons 6 cwts. per acre. Of live-stock the numbers were—horses, 2533; cattle, 10,766; sheep, 15,982; swine, 2232. Total stock, 31,513. This county contains several remains of Roman antiquities. Pop. 38,645. Constituency in 1862, returning one M.P., 766.

LINLITHGOW, a market-town, royal and municipal burgh of Scotland, chief town of the county of the same name, a station on the Edinburgh and Glasgow Railway, is situated on a small lake, 18 miles west of Edinburgh. It was founded by David I. (1124—1153), and, though it has been much modernised, it still contains many antiquated houses, and some ruins rich in historical association. The parish church of St Michael's (built partly in the 15th and partly in the 16th c.), a portion of which is still in use, is a beautiful specimen of early Gothic. The palace, strikingly situated on an eminence which divides the lake (of 102 acres) into two almost equal parts, was founded in the 15th century. It is quadrangular in form, and heavy, but imposing in appearance; was frequently the residence of the later Scottish monarchs, and is the birthplace of Mary, Queen of Scots. In the main street of the town the Regent Moray was assassinated by Hamilton of Bothwellhaugh. L. unites with several other burghs in sending a member to parliament. Pop. (1861) 3693.

LINNÉ, **KARL VON**, often called **LINNÆUS**, one of the greatest of naturalists, was born 4th May 1707, at Rasnult, in Smaland (Sweden), where his father was a country parson in very poor circum-

stances. His parents intended him for his father's profession, but he made little proficiency in the necessary classical studies, manifesting, however, from his very boyhood, the greatest love for botany. His father, disappointed, proposed to apprentice him to a shoemaker; but Dr John Rothmann, a physician at Wexiö, a friend of his father, undertook for a year the expense of his education, and guided him in the study of botany and of physiology. In 1727, the young naturalist went to study medicine at Lund, and in the year following he went to Upsala, but during his attendance at the university he endured great poverty. Olaf Celsius received him at last into his house, and availed himself of his assistance in preparing a work on the plants of the Bible. He also won the favourable regard of Olaf Rudbeck, the professor of botany at Upsala, by a paper in which he exhibited the first outlines of the sexual system of botany, with which his name must ever remain connected. Rudbeck appointed him curator of the botanic garden and botanical demonstrator. In his 24th year he wrote a *Hortus Uplandicus*. From May to November 1732, he travelled in Lapland, at the expense of the government. The fruits of this tour appeared in his *Flora Lapponica* (Amst. 1737). He afterwards spent some time at Fahlun, studying mineralogy, and there he became acquainted with the lady whom he afterwards married, the daughter of a physician named Morius, who supplied him with the means of going to Holland to take his degree, which he obtained at Harderwyck in 1735. In Holland, he became the associate of some of the most eminent scientific men of the time, and won for himself a high reputation as a naturalist, developing original views which attracted no little attention, while he eagerly prosecuted his researches in all departments of natural history. During his residence in Holland, L. composed and published, in rapid succession, some of his greatest works, particularly his *Systema Naturæ* (Leyd. 1735), his *Fundamenta Botanica* (Leyd. 1736), his *Genera Plantarum* (Leyd. 1737), his *Corollarium Generum Plantarum* (Leyd. 1737), &c. He visited England and France, and returned to Sweden, where, after some time, he was appointed royal botanist and president of the Stockholm Academy. In 1741, he was appointed professor of medicine in Upsala, and in 1742 professor of botany there. The remainder of his life was mostly spent at Upsala in the greatest activity of scientific study and authorship. He produced revised editions of his earlier works, and numerous new works, a *Flora Suecica* (1745), *Fauna Suecica* (1746), *Hortus Upsaliensis* (1748), *Materia Medica* (1749—1752), his famous *Philosophia Botanica* (1751), and the *Species Plantarum* (1753), in some respects the greatest of all his works. He died on 10th January 1778, the last four years of his life having been spent in great mental and bodily infirmity. L. was not only a naturalist of most accurate observation, but of most philosophical mind, and upon this depended in a great degree the almost unparalleled influence which he exercised upon the progress of every branch of natural history. Among the important services which he rendered to science, not the least was the introduction of a more clear and precise nomenclature. The groups which he indicated and named have, in the great majority of instances, been retained amid all the progress of science, and are too natural ever to be broken up; while, if the botanical system which he introduced is artificial, L. himself was perfectly aware of this, and recommended it for mere temporary use till the knowledge of plants should be so far advanced that it could give place to a natural arrangement. See **BOTANY**.

LINNET (*Lineta*), a genus of small birds of the family *Fringillidae*, nearly resembling the true finches, gold-finches, &c. The bill is short, straight, conical, and pointed; the wings long, and somewhat pointed; the tail forked. The species are widely distributed in the northern, temperate, and arctic regions, but much confusion has arisen concerning them, from the difference between the plumage of the breeding season and that of the greater part of the year.

Common Linnet (*L. cannabina*).

The **Common L.** (*L. cannabina*), or **GREATER REDPOLE** (sq. *Redpoll*), is common in almost every part of the British Islands and of Europe, and extends over Asia to Japan. In size, it is about equal to the chaffinch. In its winter-plumage, its prevailing colour is brown, the quill and tail feathers black with white edges; in the nuptial-plumage, the crown of the head and the breast are bright vermillion colour, and a general brightening of colour takes place over the rest of the plumage. This change of plumage causes it to be designated the brown, gray, or rose L., according to the season of the year and the sex. It is the *Lineta* of the Scotch. The sweetness of its song makes it everywhere a favourite. It sings well in a cage, and readily breeds in confinement; but the brightness of the nuptial-plumage never appears. The L. abounds chiefly in somewhat open districts, and seems to prefer uncultivated and furze-covered grounds. Its nest is very often in a furze-bush or hawthorn-hedge; is formed of small twigs and stems of grass, nicely lined with wool or hair; the eggs are four or five in number, pale bluish white, speckled with purple and brown. Linnets congregate in large flocks in winter, and in great part desert the uplands, and resort to the sea-coast.—The **MOUNTAIN REDPOLE** (*L. cannabina*) is also a widely distributed species, and is found in North America, as well as in Europe and Asia, chiefly in very northern regions. It is rare in Britain. In size, it is nearly equal to the Common Linnet. By some, it is regarded as a larger variety of the **GREATER REDPOLE** or **COMMON REDPOLE** (*L. linaria*), which is common in Britain, although in the south of England it is chiefly known as a winter visitor. The forehead, throat, and lores are black; in the spring-plumage, the crown of the head is deep crimson; the general colour is brown of various shades. This species is common in all the northern parts of the world, surviving with its pleasant twitter and sprightly habits even the desolate wastes of Spitzbergen.—The only other British species is the **MOUNTAIN L.** or **TWEEN** (*L. montana*), chiefly found in mountainous or very northern districts. It is smaller than the preceding, has a yellowish bill, and never assumes the red colour which marks the nuptial-plumage of other species.

LINSEED, the seed of flax, is imported in large quantities into Britain from the continent of Europe, and from India, for the making of linseed oil and

oil-cake; in order to which the seeds are first bruised or crushed, then ground, and afterwards subjected to pressure in a hydraulic or screw press, sometimes without heat, and sometimes with the aid of a steam heat of about 200° F. *Linseed oil* is usually amber-coloured, but when perfectly pure it is colourless. It has a peculiar and rather disagreeable odour and taste. It is chiefly used for making varnishes, paints, &c. That made without heat (*cold-pressed linseed oil*) is purer, and less apt to become rancid, than that in making which heat is applied. By cold expression, the seed yields from 18 to 20 per cent., and with heat from 22 to 27 per cent. of oil. Linseed oil, boiled either alone or with litharge, white lead, or white vitriol, dries much more rapidly on exposure to the air than the unboiled oil; and *boiled or drying oil* is particularly adapted for many uses.—The oil-cake made in expressing linseed oil is very useful for feeding cattle, and, besides what is made in Britain, it is largely imported from the continent. See **OIL-CAKE**. Linseed itself is excellent food for cattle and for poultry. The seed coats abound in mucilage, which forms a thick jelly with hot water, and is very useful for fattening cattle.—*Linseed meal*, much used for poultices, is generally made by grinding fresh oil-cake, but it is better if made by grinding the seed itself.

LINSTOCK, an iron-shod wooden staff used in gunnery, for holding the lighted match in readiness to be applied to the touch-hole of the cannon. In old pictures, the linstock is seen planted in the ground to the right rear of each piece, with a match smoking in each of the ends of the fork in which it terminates.

LINT. See **FLAX**.

LINTEL, the horizontal bearer over doors, windows, and other openings in walls, usually either of stone or wood.

LIN-TSEH-SU, Chinese Imperial Commissioner, was born in 1785 at Hing-hwa, in the province of Fuh-keen, and his Chinese biographers have not failed to find that his birth was attended with supernatural indications of future eminence. Till he reached his 17th year, he assisted his father in his trade of making artificial flowers, and spent his evenings in studying to qualify himself for the village competitive examinations, at which he succeeded in obtaining successively the degrees analogous to Bachelor of Arts and Master of Arts. His ambitious mind, not satisfied with these triumphs, pointed to Peking as the fitting sphere of his talents, but poverty barred the way. Happily, however, a wealthy friend, who was filled with admiration for L.'s merits and virtues, invited him to become his son-in-law, and he was now in a position to push his fortune at the capital. He became a doctor of laws and a member of the Hanlin College, which latter honour qualified him for the highest official posts. When 30 years of age, he received his first official appointment as censor; and by displaying the same zeal and industry, combined with irreproachable probity, which he had shown in private life, he gradually rose into the favour of the emperor and his ministers. He was sent to superintend the repairing of the banks of the Yellow River; and on the termination of his mission, two years after, was highly complimented by his sovereign for his diligence and energy, and, as an evidence of imperial favour, was appointed to the post of financial commissioner for Kiang-nan, in which province a famine was at that time decimating the population. L. exhausted all his private resources and emoluments in providing food for the sufferers, and by careful management succeeded in restoring the prosperity of the province. He was next

Horn. The famous Teutoburg-Wald (*Salvus Teutoburgensis*), in which the legions of Varus were annihilated by Arminius (see GERMANICUS CÆSAR), runs through the southern part of the principality, which is on the whole rather hilly, but has many fertile valleys. The largest river is the Werre, a tributary of the Weser. The principal occupation of the inhabitants is agriculture, and the rearing of cattle, sheep, and swine; much pains is likewise bestowed on the cultivation and management of forests, as L. is perhaps the most richly wooded district in Germany. Linen weaving is the chief manufacturing industry of the country. Among the mineral products are marble, iron, lime, and salt. The princes of L. are one of the oldest sovereign families of Germany, and were in a flourishing condition as early as the 12th century. The first who took the name of L. was Bernhard von der Lippe, in 1129. The family split into three branches in 1613—Lippe, Brake and Schaumburg.

LIPPI, FRA FILIPPO, a Florentine painter of great talent, the events of whose life were of a very romantic kind. Born about 1412, left an orphan at an early age, he spent his youth as a novice in the convent of the Carmine at Florence, where his talent for art was encouraged and developed. Sailing for pleasure one day, he was seized by corsairs, and carried to Barbary; after some years' captivity, he regained his liberty, and is next found, in 1438, painting at Florence. Filippo was much employed by Cosmo de' Medici, and executed many important works for him. While painting in the convent of Sta Margarita at Prato, a young lady, Lucrezia Buti, a boarder or novice, who had been allowed by the nuns to sit for one of the figures in his picture, eloped with him; and though strenuous efforts were made by her relations to recover her, he successfully resisted their attempts, supported, it is thought, by Cosmo; and she remained with and had a son by him, who became an artist perhaps even more celebrated than Filippo himself. He died at Spoleto, 8th October 1469, being at the time engaged in painting the choir of the cathedral, along with Fra Diamante, one of his pupils.

LIPPI, FILIPPINO FILIPPO, commonly called **FILIPPINO LIPPI**, the son of Fra Filippo and Lucrezia Buti, was born at Florence in 1460. It is said that his father left him to the care of Fra Diamante, his pupil. He afterwards studied under Sandro Botticelli, also a pupil of his father's, and one of the most celebrated of his school. He soon acquired a high reputation, and executed various works in Florence, Bologna, Genoa, Luoca, and at Rome, where, in 1492, he painted some frescoes for the Cardinal Caraffa, in the church of Sta Maria Sopra Minerva. But the high position he attained is proved principally by his works in the Brancacci Chapel in the church of the Carmine at Florence. The frescoes in this chapel have always been held in the highest estimation; they have been studied by the most celebrated painters, among others by Raphael and Michael Angelo; and though long believed to be entirely the work of Masaccio, are now ascertained to have been commenced by Masolino, continued by Masaccio, and finished by Filippino; the works of the last being—'The restoring of a Youth to Life,' part of which was painted by Masaccio; 'The Crucifixion of St Peter;' 'St Peter and St Paul before the Proconsul,' and 'St Peter liberated from Prison;' also, according to some, 'St Paul visiting St Peter in Prison,' in which the figure of St Paul was adopted by Raphael in his cartoon of 'Paul preaching at Athens.' Filippino died at Florence on 13th April 1505.

LIQUEUR. This name is given to any alcoholic preparation which is flavoured or perfumed and sweetened to be more agreeable to the taste; there is consequently a large class of liqueurs, of which the following are the principal: *Aniseed Cordial*, prepared by flavouring weak spirit with aniseed, coriander, and sweet fennel seed, and sweetening with finely clarified syrup of refined sugar. *Abanthe* is sweetened spirit flavoured with the young tops of certain species of *Artemisia* (q. v.). *Clove Cordial*, much sold in the London gin-shops, is flavoured with cloves, bruised, and coloured with burned sugar.

Kümmel, or *Doppel-Kümmel*, is the principal liqueur of Russia; it is made in the ordinary way with sweetened spirit, flavoured with cumin and caraway seeds, the latter usually so strong as to conceal any other flavour. It is chiefly made at Riga, and there are two qualities: that made in Riga is the sort in common use, and is not the finest; the better sort is only manufactured in smaller quantities at Weissenstein, in Esthonia; the chief difference is in the greater purity of the spirit used. *Maraschino* is distilled from cherries bruised, but instead of the wild kind, a fine delicately-flavoured variety, called *Marasques*, grown only in Dalmatia, is used. This cherry is largely cultivated around Zara, the capital, where the liqueur is chiefly made. Great care is taken in the distillation to avoid injury to the delicate flavour, and the finest sugar is used to sweeten it.

Noyau, or *Crème de Noyau*, is a sweet cordial flavoured with bruised bitter-almonds. In Turkey, the fine-flavoured kernels of the Mahaleb cherry are used, and in some places the kernels of the peach or the apricot. *Peppermint*, a common liqueur, especially amongst the lower classes of London where very large quantities are sold; it usually consists of the ordinary sweetened gin, flavoured with the essential oil of peppermint, which is previously rubbed up with refined sugar, and formed into an oleosaccharum, which enables it to mix with the very weak spirit.

Curapoa and *Kirschwasser* are described under their own names.

LIQUIDAMBAR, a genus of trees of the natural order *Altingiaceæ*, and the only genus of the order, having flowers in male and female catkins on the same tree, the fruit formed of 2-celled, many-seeded

Liquidambar.

capsules, and the seeds winged. They are tall trees, remarkable for their fragrant balsamic products. *L. styraciflua*, the **AMERICAN L.** or **SWEET GUM tree**, is a beautiful tree with palmate leaves, a native of

Mexico and the United States. It grows well in Britain. Its wood is of a hard texture and fine grain, and makes good furniture. From cracks or incisions in the bark, a transparent, yellowish balsamic fluid exudes, called *Liquid Liquidambar*, Oil of *Liquidambar*, *American Storax*, *Copalm Balsam*, and sometimes, but erroneously, *White Balsam of Peru*. It gradually becomes concrete and darker coloured. Its properties are similar to those of storax. That of commerce is mostly brought from Mexico and New Orleans.—*L. Orientale*, a smaller tree with palmate leaves, is a native of the Levant and of more eastern regions, and yields abundantly a balsamic fluid, which has been supposed to be the *Liquid Storax* imported from the Levant, but on this point there is diversity of opinion.

LIQUORICE (*Glycyrrhiza*), a genus of perennial herbaceous plants of the natural order *Leguminosae*, sub-order *Papilionaceae*; having long, pinnate, sweet roots, and generally creeping root-stocks; pinnate leaves of many leaflets, and terminating in an odd one; flowers in spikes, racemes, or heads; a 5-cleft, 2-lipped calyx, and a 2-leaved keel. The ancient Greek name, now the botanical name, signifies *sweet root*, and from it, by corruption, liquorice and other modern names are derived. The roots of *L.* depend for their valuable properties on a substance called *Glycyrrhizine*, allied to sugar, yellow, transparent, uncrystallisable, soluble both in water and alcohol, and forming compounds both with acids and bases. They are a well-known article of materia medica, and were used by the ancients as in modern times, being emollient, demulcent, very useful in catarrh and

is largely imported from the south of Europe, in rolls or *sticks*, packed in bay-leaves, or in boxes of about two cwt., into which it has been run. *L.* is propagated by slips; and after a plantation has been made, almost three years must elapse before the roots can be dugged up for use. The whole roots are then taken up. *L.* requires a deep, rich, loose soil, well trenched and manured; the roots penetrating to the depth of more than a yard, and straight tap-roots being most esteemed. The old stems are cleared off at the end of each season, and the root-stocks so cut away as to prevent overgrowth above ground next year. The plant is propagated by cuttings of the root-stocks.—The roots of the PRICKLY *L.* (*G. echinata*) are used in the same way, chiefly in Italy and Sicily, Russia, and the East.—The only American species is *G. lepidota*, which grows in the plains of the Missouri.

LIRA (Lat. *libra*; see **LIVRE**), an Italian silver coin of greater or less value according to time and place. The Tuscan lira was equal to 80 French centimes; the Austrian lira or *zwanziger* was about the same value. The present Lira Italiana, or Lira nuova, of the Italian kingdom is equal to the French franc, and is divided into 100 centimes.

LIRIODENDRON. See **TULIP TREE**.

LISBON (called by the ancient Lusitanians, *Olisipo* or *Ulisippo*, and by the Moors *Lishbuna* or *Ashbuna*), the capital of Portugal, is situated in the province of Estremadura, on the right bank of the Tagus, which is here about six miles wide, and about eighteen miles from the mouth of the river. Pop. 275,300. The city is built partly on the shores of the Tagus, and partly on three larger and four smaller hills. Its appearance is wonderfully picturesque; and its resemblance, in point of situation and magnificence of prospect, to Constantinople, at precisely the opposite extremity of Europe, has been frequently remarked. Including its suburbs, it extends about five miles along the river. The harbour, which is safe and spacious, is protected by strong forts, but the city itself is unwallled and without any fortifications. The eastern and older part, which lies round the Castle-hill—an eminence crowned with an old Moorish castle, destroyed by earthquakes—is composed of steep, narrow, crooked, badly-paved streets, with high, gloomy, wretched-looking houses; but the newer portions are well and regularly built. The most beautiful part is called the *New Town*—it stretches along the Tagus, and is crowded with palaces. Among the places or squares, the principal are the *Praco do Commercio*, on the Tagus, 565 feet long, 520 broad, surrounded on three sides with splendid edifices; the *Praco do Rocio*, in the New Town, forming the market-place, 1800 feet long, and 1400 broad; and the *Passeio Publico*. The whole of the New Town, and the district round the royal castle, is lighted with gas. *L.* has 41 parish churches, 82 monasteries, hospices, and hospitals, 99 chapels, 5 large theatres, and an amphitheatre. The most conspicuous public buildings are the Church of the Patriarch, the Monastery of the Heart of Jesus (with a cupola of white marble), the Church of St Roque (built of marble), the Foundling Hospital (receiving annually about 1600 children), St James's Hospital (capable of receiving 16,000 sick persons), the royal palaces of Ajuda, *Nossa Senhora das Necessidades*, and Bemposta, the custom-houses, the arsenal, and the National Theatre, which occupies the site of the old Inquisition buildings. There are likewise a number of educational and scientific institutions. Among other notable objects, the most important is the Alcantara Aqueduct (called *Os Arcos*, or *Agua livre*, and finished in 1743),

Common Liquorice (*Glycyrrhiza glabra*).

irritations of the mucous membrane.—The roots of the COMMON *L.* (*G. glabra*) are chiefly in use in Europe. The plant has stems 3–4 feet high, and racemes of whitish violet-coloured flowers. It is a native of the south of Europe and of many parts of Asia, as far as China. It is cultivated in many countries of Europe, chiefly in Spain, and to some extent in the south of England, where its cultivation is at least as old as the times of Elizabeth. The roots are extensively employed by porter-brewers. They are not imported into Britain in considerable quantity, but the black inspissated extract of them (*Black Sugar* or *Stick Liquorice*)

which supplies all the public fountains and wells of the city. It is 18 miles in length, and in one place 260 feet high, and remained uninjured at the great earthquake. It is the greatest piece of bridge-architecture in the world. The manufactures of L. are inconsiderable, but it is the principal trading port of Portugal, and contains 130 foreign commercial firms. In 1861, 1630 vessels entered and cleared the port; and of these, 677 vessels, of 122,191 tons, were British. In the year 1860—1861, the imports, consisting chiefly of cottons, metals, colonial produce, and woollens and furs, amounted to £2,842,853; and the exports, chiefly liquors and animal and chemical products, to £1,297,062. About 30,000 Galegos (Galicians) earn a subsistence here as porters, and in other sorts of hard work.

L. is said to have been founded by the Phœnicians, was a flourishing commercial city when the Romans first became acquainted with it, and the capital of Lusitania. It was taken by the Moors in 712, from whom, after undergoing many vicissitudes, it was recaptured by Alfonso I. in 1147; became the seat of an archbishopric in 1390, and of a patriarchate in 1716. L. has been frequently visited by earthquakes; that of 1755 destroyed a great part of the city and 20,000 of the inhabitants.

LISBURN, a market-town and parliamentary borough, situated on the river Lagan, partly in the county of Antrim, partly in the county of Down, Ireland. It is distant from Dublin 97 miles north-north-east, and 8½ south-south-west from Belfast, with both which places it is connected by the Dublin and Belfast Junction Railway. The population in 1861 was 9653; of whom 4330 were Protestants of the Established Church, 2543 Catholics, and the rest Protestants of various denominations. L. originated in the erection of a castle, in 1610, by Sir Fulk Conway, to whom the manor was assigned in the settlement of James I.; but its importance dates from the settlement of a number of Huguenot families, who, after the revocation of the Edict of Nantes, established themselves at L., where they introduced the manufacture of linen and damask, after the method and with the machinery then in use in the Low Countries. It is a clean and well-ordered town, with a convenient market, and considerable manufactures of linens and damasks; besides which, bleaching, dyeing, flax-dressing, flax-spinning, &c., are carried on. Its parish church is the cathedral of Down and Connor, and is interesting as the burial-place of Jeremy Taylor, who was bishop of that see, and died at L. in 1667. L. returns one member to parliament.

LISIEUX (ancient *Noviomagus Lexovium*), a town of Northern France, on the Touques, 27 miles east-south-east of Caen, at the entrance of a beautiful valley. The principal building is the church of St Pierre (formerly a cathedral), belonging to the 13th c., and built on the site of an older edifice, in which Henry II. of England married Eleanor of Guienne. L. is the centre of an extensive manufacture of coarse linens, woollens, flannels, horsecloths, ribbons, &c., which gives employment to more than 3000 workmen. Pop. 13,000.

LISKEARD, a municipal and parliamentary borough in Cornwall, is situated in a well-cultivated district, on the Looe, 16 miles west-north-west of Plymouth. Two miles to the south of the town is a famous spring, said to have been presented to the inhabitants by St Keyne, and the virtue of whose waters is set forth in Southey's well-known ballad, *The Well of St Keyne*. There are manufactures of serge and leather, and considerable traffic in the produce of the tin, copper, and lead mines of the

neighbourhood. L. returns a member to parliament. Pop. (1861) of parliamentary borough, 6585.

LISMO'ORE, an island of Argyllshire, six miles from Oban, is situated in Loch Linnhe, and is 10 miles in length, with an average breadth of 1½ miles. It contains the remains of several interesting buildings, as Achinduin Castle—formerly the residence of the Bishops of Argyre—an old cathedral and Castle Rachal, a Scandinavian fort, now very ruinous. The island is for the most part under cultivation. Pop. (1861) 853.

LISSA (Pol. *Leszna*), a town of Prussia, in the province of Posen, and the circle of Fraustadt, 44 miles south-south-west of Posen. Pop. 10,014, of whom nearly one half are Jews. L. has a fine townhouse, a castle, one Roman Catholic and three Protestant churches, with manufactures of woollens, leather, and tobacco. This place became for a time the chief seat of the Bohemian Brothers.

LIST. See FILET.

LISTON, ROBERT, a celebrated surgeon, was born at Ecclesmachan, in the county of Linlithgow, in 1794, and was the son of the Rev. Henry Liston, the minister of the parish. After studying anatomy under Barclay in Edinburgh, and following the usual course of medical study in that city, he proceeded to London in 1816, where he attended the surgical practice of the Blizards at the London Hospital, and of Abernethy at St Bartholomew's. After becoming a member of the Royal College of Surgeons of London, he returned to Edinburgh, and in 1818 was elected a Fellow of the Royal College of Surgeons of that city.

L. now commenced his career as a lecturer on anatomy and surgery, and soon became remarkable for his boldness and skill as an operator. In consequence of his performing many successful operations on patients who had been discharged as incurable by the surgeons of the Edinburgh Infirmary, he was requested by the managers to refuse his assistance to any person who had been a patient in that institution, and to abstain from visiting the wards. He naturally declined to accede to these extraordinary propositions, and in consequence was expelled, and never entered again its wards, until in 1827 he was elected one of its surgeons. His surgical skill, and the rapidity with which his operations were performed, soon acquired for him a European reputation; and in 1835, he accepted the invitation of the council of University College to fill the chair of Clinical Surgery. He soon acquired a large London practice; in 1840, he was elected a member of the council of the College of Surgeons; and in 1846, he became one of the Board of Examiners. In the very climax of his fame, and apparently in the enjoyment of vigorous health, he was struck down by disease, and died 7th December 1847.

His most important works are his *Elements of Surgery*, which appeared in 1831, and his *Practical Surgery*, which appeared in 1837, and has gone through four editions. His uncontrollable temper, and the coarseness of language in which he frequently indulged, involved him in various quarrels with his professional brethren; yet, notwithstanding these defects, he always succeeded in obtaining the regard and esteem of his pupils.

LISZT, FRANZ, pianist, was born at Raiding, in Hungary, 22d October 1811. His father, a functionary employed on the estates of Prince Esterhazy, was himself possessed of some musical skill, and carefully cultivated the wonderful talent which L. shewed even in his infancy. In his ninth year, the child played publicly at Presburg, and excited universal astonishment. By the assistance of two Hungarian noblemen—Counts Amadi and

Sapary—L. was sent to Vienna, and placed under the instruction of Czerny and Salieri. He studied assiduously for eighteen months, after which he gave concerts in Vienna, Munich, and other places with brilliant success. In 1823, he proceeded with his father to France, intending to complete his musical education at the Conservatoire; but he was refused admission on account of his being a foreigner; nevertheless, his genius made a way for itself. He played before the Duke of Orleans, and very soon the clever, daring boy became the favourite of all Paris. Artists, scholars, high personages, ladies—all paid homage to his marvellous gift, and it was only owing to his father's strict supervision that young L. was not entirely spoiled. In the course of the next three years, he visited England thrice, and was warmly received. In 1827, his father died at Boulogne, and L. became his own master at the age of sixteen. For some years after this, his life sufficiently proved that he had become independent too soon. Alternations of dissipation and religious mysticism induced his admirers to fear that his artistic course would end in disastrous failure. Fortunately, he heard the famous violinist, Paganini, in 1831, and was seized with a sudden—but, as it also proved, a permanent—ambition to become the Paganini of the piano; and one may say that, on the whole, he has succeeded. Up till 1847, his career was a perpetual series of triumphs in all the capitals of Europe. He then grew tired of his itinerant life, and accepted the situation of leader of the court concerts and operas at Weimar, where he has since resided. In this capacity he has been as successful as in that of a public performer, and has made Weimar one of the musical centres of Europe. L. has also been an industrious and original contributor to musical literature.

LITANY (Gr. *litaneia*, a supplication), a word the specific meaning of which has varied considerably at different times, but which means in general a solemn act of supplication addressed with the object of averting the divine anger, and especially on occasions of public calamity. Through all the varieties of form which litanies have assumed, one characteristic has always been maintained—viz., that the prayer alternates between the priest or other minister, who announces the object of each petition, and the congregation, who reply in a common supplicatory form, the most usual of which was the well-known 'Kyrie eleison!' (Lord, have mercy!) In one procession which Mabillon describes, this prayer, alternating with 'Christe eleison,' was repeated 300 times; and in the capitularies of Charlemagne, it is ordered that the 'Kyrie eleison' shall be sung by the men, the women answering 'Christe eleison.' From the 4th c. downwards, the use of litanies was general. The *Antiphonary* of St Gregory the Great contains several. In the Roman Catholic Church, three litanies are especially in use—the 'litany of the saints' (which is the most ancient), the 'litany of the name of Jesus,' and the 'litany of Our Lady of Loretto.' Of these, the first alone has a place in the public service-books of the church, on the rogation-days, in the ordination service, the service for the consecration of churches, the consecration of cemeteries, and many other offices. Although called by the name of litany of the saints, the opening and closing petitions, and indeed the greater part of the litany, consist of prayers addressed directly to God; and the prayers to the saints are not for their help, but for their intercession on behalf of the worshippers. The litany of Jesus consists of a number of addresses to our Lord under his various relations to men, in connection with the several details of his passion, and of adjurations of him

through the memory of what he has done and suffered for the salvation of mankind. The date of this form of prayer is uncertain, but it is referred, with much probability, to the time of St Bernardino of Siena, in the 15th century. The litany of Loretto (see LORETTO) resembles both the above-named litanies in its opening addresses to the Holy Trinity, and in its closing petitions to the 'Lamb of God, who taketh away the sins of the world;' but the main body of the petitions are addressed to the Virgin Mary under various titles, some taken from the Scriptures, some from the language of the Fathers, some from the mystic writers of the medieval church. Neither this litany nor that of Jesus has ever formed part of any of the ritual or liturgical offices of the Catholic Church, but there can be no doubt that both have in various ways received the sanction of the highest authorities of the Roman Church.

In the Prayer-book of the English Church, the litany is retained, but although it partakes of ancient forms, it differs from that of the Roman Church, and contains no invocation of the Virgin or the saints. It is divided into four parts—invocations, deprecations, intercessions, and supplications, in which are preserved the old form of alternate prayer and response. It is no longer a distinct service, but, when used, forms part of the morning prayer.

LITCHI, or LEE-CHEE (*Nephelium Litchi*), one of the most delicious fruits of China and of the Malayan Archipelago. The tree which produces it belongs to the natural order *Lapindaceae*, and has pinnate leaves. It is extensively cultivated in the southern provinces of China, and in the northern provinces of Cochin-China, but is said to be impatient of a climate either much more hot or much more cold. The fruit is of the size of a small walnut, and grows in racemes. It is a red or green berry, with a thin, tough, leathery, scaly rind, and a colourless semi-transparent pulp, in the centre of which is one large dark-brown seed. The pulp is slightly sweet, subacid, and very grateful. The Chinese preserve the fruit by drying, and in the dried state it is now frequently imported into Britain, still preserving much richness of flavour.—The *Longan* and *Rambutan* are fruits of the same genus.

LITHARGE. See LEAD.

LITHIA. See LITHIUM.

LITHIC ACID. See URIC ACID.

LITHIC ACID DIATHESIS is the term employed in Medicine to designate the condition in which there is an excess of lithic (or uric) acid, either free or in combination, or both, in the urine. The urine of persons who have the lithic acid diathesis is usually of a dark golden colour, like brown sherry, and is more acid, of higher specific gravity, and less abundant than the urine in health. When the urine cools, there is usually a deposit or sediment of lithates. The sediment is usually spoken of as one of lithate (or urate) of ammonia, but in reality it consists mainly of lithate of soda mixed with lithates of ammonia, potash, and lime. Its colour varies according to the amount and nature of the urine-pigment which tenaciously adheres to it, so that its tints vary from a whitish yellow to a brickdust red, or even a deep purple. Persons seeing these deposits in their urine when it has cooled, are very apt to believe that they may aggregate and harden in the bladder, and form a stone. Such fears may, however, be relieved by heating the urine containing the sediment to the temperature of the interior of the body (about 100°), when the fluid will resume its original clearness, and the sediment will disappear.

The colour of the deposit is of considerable importance in determining its value as a morbid symptom. Tawny or reddish sediments of this kind are frequently the result of mere indigestion or a common cold; the yellowish-white ones deserve more attention, as they are believed frequently to precede the excretion of sugar through the kidneys. The pink or brickdust sediments are almost always associated with febrile disturbance or acute rheumatism; and if these sediments are habitual, without fever, there is most probably disease of the liver or spleen. If the urine is very acid, a portion of the lithic acid is separated from its base, and shews itself, as the fluid cools, in a free crystallised state, resembling, to the naked eye, grains of Cayenne pepper, but appearing under the microscope as rhombic tablets. This free lithic acid is far less common than the lithates, and does not dissolve on the application of heat.

The persons who suffer from this diathesis are chiefly adults beyond the middle age, and of indolent and luxurious or intemperate habits. As the formation of lithic deposits is due to over-acidity of the urine, alkalies are the medicines most commonly prescribed, and the preparations of potash are far preferable to those of soda, because lithate of potash is perfectly soluble, and will pass off dissolved in the urine, while lithate of soda is a hard, insoluble salt.

Regimen is, however, of far more use than medicine in the lithic acid diathesis. The patient should dine moderately and very plainly, avoiding acid, saccharine, and starchy matters and fermented liquors. The skin should be made to act freely by friction, and by occasional warm or daily tepid baths. Warm clothing must be used; plenty of active exercise must be taken in the open air; and the healthy action of the bowels and liver duly attended to. It must be recollected that the lithates are sometimes thrown down, not from undue acidity of the urine, but simply from that fluid not containing the due quantity of water to hold them in solution. In such cases, a tumbler of cold spring-water taken night and morning will at once cause the cessation of this morbid symptom.

LITHIUM (symb. *L*; equiv. 6.4; sp. gr. 0.5936) is the metallic base of the alkali *lithia*, and derives its name from the Greek word *lithos*, a stone. The metal is of a white silvery appearance, and is much harder than sodium or potassium, but softer than lead. It admits of being welded at ordinary temperatures, and of being drawn out into wire, which, however, is inferior in tenacity to leaden wire. It fuses at 356°. It is the lightest of all known metals, its specific gravity being little more than half that of water; it decomposes water at ordinary temperatures. It burns with a brilliant light in oxygen, chlorine, and the vapours of iodine and bromine. It is easily reduced from its chloride by means of a galvanic battery. Lithium forms two compounds with oxygen, viz., lithia (known also as lithion or lithon), which is the oxide of lithium, and a peroxide of lithium whose formula has not been determined.

Lithia, in a pure and isolated state, cannot be obtained. Hydrate of lithia (LO.HO) occurs as a white translucent mass, which closely resembles the hydrates of potash and soda. The salts of lithia are of sparing occurrence in nature. The minerals petalite, triphane, lepidolite, and tourmaline contain lithia in combination with silicic acid, while triphylite and amblygonite contain it as a phosphate; it is also present in small quantities in many mineral waters.

Carbonate of lithia (LO.CO_2) is precipitated when carbonate of ammonia is added to a strong

solution of chloride of lithium, and occurs as a white mass with a slight alkaline reaction. At a dull red heat, it melts into a white enamel. It requires 100 parts of water for its solution, but is more soluble in water charged with carbonic acid. The solution of the salt has been strongly recommended in cases of gout and gravel, in consequence of the solvent power which it exerts on uric acid. The sulphate, phosphate, and nitrate of lithia are of no special importance. Chloride of lithium ($\text{LCl} + 4 \text{ aq.}$) is readily prepared by dissolving the hydrate of lithia in hydrochloric acid, and evaporating. It crystallises in octohedra, and is one of the most deliquescent salts known. It is of importance as being the source from whence lithium and carbonate of lithia are obtained.

Lithia was discovered in 1817 by Arfvedson. The metal lithium was first obtained in 1822 by Brande, but nothing was known regarding its properties until 1855, when Bunsen and Matthiessen discovered the present method of obtaining it, and carefully investigated its physical and chemical characters.

LITHOGRAPHY (Gr. *lithos*, a stone), the art of printing from stone, was invented by Aloys Senefelder, at Munich, about the end of the 18th century. It consists, first, in writing and drawing on the stone with the pen and brush, with the graver, and with the crayon or chalk; or in transferring to the stone writings and drawings made with the pen or brush on transfer-paper, or impressions from copper, steel, and pewter plates, taken on a coated paper, and then in printing off from the stone the writings or drawings thus made upon it. The principles of the art are these: an unctuous composition having been made to adhere to a calcareo-argillaceous stone, those parts covered by it—i.e., the writing or drawing—acquire the power of receiving printing-ink, whereas those parts not containing the writing or drawing are prevented from receiving ink from the inking-roller by the interposition of water; and lastly, an absorbent paper being laid on the stone, and subjected to strong pressure, copies are obtained.

The best *lithographic stones* are found at Kelheim and Solenhofen, near Pappenheim, on the Danube, in Bavaria; but they have been found also in Silesia, England, France, Canada, and the West Indies. These stones are composed of lime, clay, and siliceous earth, and are of various hues, from a pale yellowish-white to a light buff, reddish, pearl-gray, light-gray, blue, and greenish colour. Those of uniform colour are the best. The yellow-buff ones, being soft, are adapted for lettering and transfer; the pearl-gray ones, being harder, for chalk-drawings and engraving. They are found in beds, commencing with layers of the thickness of paper, till they reach the dimensions of one, and several inches in thickness, when they are easily cut, being yet soft in the quarries, to the sizes required for printing purposes. The stones are ground plane with sand, and, when required for the pen, the brush, the graver, or transfer, they are polished with pumice and water-of-Ayr stone; and for chalk-drawings and graduated tints, an artificial grain is given by ground glass or fine sand.

When any writing or drawing has been finished on stone, it then requires to be etched, thus: a mixture of 2 parts of nitric acid, and from 40 to 60 parts of dissolved gum-arabic, is poured over the stone once or several times, according to the nature of the work. The etching changes the surface of the stone, raising the work on it to a degree scarcely perceptible to the naked eye. The writing or drawing, which has been effected by greasy ink or chalk, remains protected from the

action of the acid, and those protected parts retain the natural property of the stone, which is the qualification of receiving printing-ink; and, when the printer wets the stone before applying the inking-roller, the water enters only those parts of the stone which have been affected by the acid, while the ink adheres only to those parts, however fine, on which the acid could not operate, owing to the unctuous composition of the ink or chalk with which the drawing or writing has been done, and which, being greasy, rejects the water. Thus it is called *chemical printing*.

The *chemical ink*, for *writings and drawings in line*, is composed of 2 parts of white wax, 2 shell-lac, 1 hard soap, $\frac{1}{2}$ tallow, $\frac{1}{2}$ carbonate of soda, and 1 of powdered lamp, or better, Paris black. The chemical chalk (crayon) is made of 3 parts of white wax, 2 hard soap, 1 shell-lac, $\frac{1}{2}$ 'drops of' mastic, 1 tallow, $\frac{1}{2}$ old lard, $\frac{1}{2}$ Venetian turpentine, $\frac{1}{2}$ Brunswick black, $\frac{1}{2}$ carbonate of soda, and 1 $\frac{1}{2}$ of Paris black, properly melted and burned together.

When the *drawing or writing with ink* on a polished stone is completed, the etching is proceeded with, and a portion of the etching composition allowed to dry on the stone. The printer then adjusts his stone in the press, washes off the dried gum, removes the whole drawing or writing with turpentine, wets the stone with a sponge or damping canvas, then applies his roller containing the printing-ink, and rolls it several times over the stone till the lines appear again. When sufficient ink has been applied to the lines, the paper is laid on the stone, drawn through the press, and the impression effected. The damping and inking of the stone are renewed for every impression.

Chalk-drawings are done on the grained stone with the chemical chalk, with the stump and scraper, and sharp lines with ink; so that, if boldly and systematically treated, by giving the effect first, and detail afterwards, there will be produced richness and softness of appearance and freedom of manipulation, and a great many impressions will be yielded.

Tinted drawings, chromo-lithography, and coloured maps require as many stones—grained or polished, as the case may be—as there are various tints or colours, one stone being printed after the other, and so fitted and blended together as to produce, when complete, the effect desired.

Great Britain is famed for *writings, plans, and drawings*, done with transparent quills, steel-pens, and small camel-hair brushes, on *yellow transfer paper*, prepared as follows: 1 part best flake-white, 1 isinglass or gelatine, with a little gamboge to give it colour, are dissolved in water over a slow fire, then sifted through double muslin, and spread *once*, in a very warm state, with a large, flat camel-hair brush on one side of good-sized, smooth, thin paper, which, when dry, requires to be passed frequently over a heated stone, through the press. The paper being drawn or written upon with lithographic ink, is, when finished, put for a few minutes between damp blotting-paper; a warmed stone is put in the press, the sheet is placed with the coated side upon it, and then passed several times through the press; the back of the paper, now adhering to the stone, is then sponged with water; the stone is turned, and passed several times again through the press in the opposite direction, after which the sheet is softened with water, and rubbed with the fingers until it can be easily removed from the stone. Some gum is then put upon it, and a linen rag, dipped in printing-ink, and, with the aid of a little water, passed in all directions over the lines till they appear black and clean. The stone is then allowed to cool, inked up with the roller,

then very slightly etched, and, after being cleaned, is ready for use.

Authography is the name given to a writing or drawing done with the chemical ink on one side of any plain—not coated—paper, for example, bankers' circulars; the transfer is done in the same manner as already described, with the difference, that the sheet, when laid on the stone, is passed only *once* through the press.

Transferring of any writings, maps, drawings in line or music, done on copper, steel, and pewter-plates, and retransferring of any line-work, already on the stone, form a very important part of lithography, as an unlimited number of impressions can be produced at a very moderate expense without wearing out the original plates or stones, and as parts of various plates, stones, and letterpress can be transferred to, and printed from, the same stone. The best *transfer-paper for this purpose* is the following: mix 3 parts of shoemakers' paste (without alum) with 1 part of best ground plaster of Paris, a little dissolved patent glue, and some tepid water; strain the mixture through double muslin in a common jar, and, when cooled, spread it with a large, flat camel-hair brush over half-sized thickish paper. The ink for *taking transfers* is a composition of two table-spoonfuls of printing varnish, 1 $\frac{1}{2}$ parts of tallow, 3 brown hard soap, 4 brown wax, 5 shell-lac, 5 black pitch, and 2 $\frac{1}{2}$ parts of powdered lampblack. The various ingredients are melted for 25 minutes, and fire set to the mass for other 15 minutes—afterwards formed in sticks. When the impressions have been made on this coated paper with this transfer-ink, the transfer is accomplished on the stone as already described.

With regard to *engraving and etching on stone, photo-lithography, the application of electrotyping to lithography*, the working of the *ruling-machine* for skies and ornaments, the *lithographic steam-press*, &c., we must refer the reader to special works treating on Lithography.

It may not be out of place to mention, that in the field of lithography Germany occupies the first place for *careful execution, France for rich and artistic effect, Britain for transferring, tint-printing, and chromo-printing*.

Strixner, Hohe, Hanfstängl, Piloty, Loehle, Locillot, Auer, Leon Noel, Mouilleron, Engelmann, Sabatier, Calame, Lasalle, Haghe, Ghémar, Hullmandel, Day, Hanhart, Brooks, Lemerrier, may be mentioned, from among many others, who have helped to perfect lithography.

LITHOLOGY (*lithos*, a stone) is that division of geology which considers the constitution and structure of rocks, apart from their relations in time or position to each other. See GEOLOGY.

LITHOMARGE, an earthy mineral, sometimes called *Mountain Marrow* (Ger. *Steinmark*), consisting chiefly of silica and alumina, with oxide of iron and various colouring substances. It is soft, greasy to the touch, and adheres strongly to the tongue. It is generally white, yellow, or red, often exhibiting very beautiful colours. It is found in Germany, Russia, &c., also in the tin-mines of Redruth in Cornwall.

LITHONTRIPTICS (from the Greek words *lithos*, a stone, and *tribo*, I wear out) is the term which is applied to those remedies which, whether taken by the mouth, or injected into the bladder, act as solvents for the stone.

Various medicines have at different times been recommended and employed as solvents for the stone. Rather more than a century ago, limewater and soap, when swallowed in sufficient quantities, had a high reputation as solvents for urinary calculi. These were the only active ingredients in Miss

Stephens's *Receipt for the Stone and Gravel*, which was reported on so favourably by a committee of professional men, that parliament, in 1739, purchased the secret for £5000. The treatment doubtless afforded relief; but there is no evidence that any calculus was actually dissolved, for in the bladder of each of the four persons whose cure was certified in the report, the stone was found after death! At present, no substance, which, taken by the mouth, has the power of dissolving calculi, is known; but as Dr Prout remarks in his well-known treatise, *On the Nature and Treatment of Stomach and Urinary Diseases*, remedies of this class are to be sought 'among harmless and unirritating compounds, the elements of which are so associated as to act at the same time, with respect to calculous ingredients, both as alkalies and acids.' Solutions of the super-carbonated alkalies containing a great excess of carbonic acid—as, for example, the natural mineral waters of Vichy—approach most nearly to what is required. The relief which, in many instances, has followed the administration by the mouth of substances supposed to be lithontriptics, has been derived not from the solution of the calculi, but from the diminution of pain and irritation in the bladder.

On the other hand, considerable success has been obtained by the direct injection of solvents into the bladder, especially when the nature of the calculus is suspected; weak alkaline solutions having apparently caused the disappearance of uric acid calculi, while phosphatic calculi have unquestionably been dissolved by the injection of very weak acid solutions. It is reported that a weak galvanic current has been recently found successful in the hands of an Italian surgeon.

LITHOPHAGIDÆ (Gr. *stone-eaters*), a term sometimes applied to the molluscs which bore holes for their own residence in rocks. See **PHOLAS**.

LITHOPHANE (Gr. *phanos*, clear, transparent), a peculiar style of ornamental porcelain chiefly adapted to lamps and other transparencies; it consists of pretty pictures produced on thin sheets of white porcelain by stamping the porcelain, whilst still soft, with raised plaster-of-Paris casts of the pictures intended to be produced. By this means, an intaglio impression is obtained; and when the sheet of porcelain has been hardened by fire, the impression gives a picture, owing to the transparency of the porcelain, which has the lights and shadows correctly shewn, if viewed by transmitted light. Lithophane pictures are common in Germany, where the art has been more favourably received than in France, its native country. They are usually employed to form the sides of ornamental lamps and lanterns, and are sometimes inserted in decorative windows.

LITHOTOMY (Gr. *lithos*, a stone; *tomē*, the act of cutting), the technical name for the surgical operation popularly called *cutting for the stone*.

As most of the symptoms of stone in the bladder (which are noticed in the article **CALCULUS**) may be simulated by other diseases of the bladder and adjacent parts, it is necessary to have additional evidence regarding the true nature of the case before resorting to so serious an operation as lithotomy. This evidence is afforded by *sounding* the patient—a simple preliminary operation, which consists in introducing into the bladder, through the natural urinary passage (the urethra), a metallic instrument, by means of which the stone can be plainly felt and heard.

Lithotomy has been performed in various ways at different times. The earliest form of lithotomy is known as *cutting on the gripe*, or *Celsus's method*. It

received the former name from the stone, after being fixed by the pressure of the fingers in the anus, being directly cut upon and extracted; and the latter, from its having been first described, so far as is now known, by Celsus, although it had probably been practised from time immemorial. At a later period, this operation received from Mariannus the name of the *apparatus minor* (from a knife and hook being the only instruments used), to distinguish it from his own method, which he called the *apparatus major*, from the numerous instruments he employed. The *Marian method* was founded on the erroneous idea, that wounds of membranous parts would not heal, while their dilatation was comparatively harmless. The object was to do as little as possible with the knife, and as much as possible with dilating instruments; and the necessary result was laceration and such other severe injury, that this became one of the most fatal operations in surgery. Nevertheless, it was the operation mainly in vogue for nearly 200 years, till Frère Jacques, in 1697, introduced what is essentially the method now in use.

The *lateral operation*, so called from the lateral direction in which the incision is made into the neck of the bladder, in order to avoid wounding the rectum, is that which, with various minor modifications, is almost universally employed at the present day. Frère Jacques, a priest, seems to have learned the method from a provincial surgeon named Pierre France, and to have practised it with much success; and, in 1697, he came to Paris in order to make it publicly known. The advantage of this operation, by which a free opening, sufficiently large for the extraction of a stone, can be made into the bladder without laceration of the parts or injury to the rectum, was immediately recognised by the leading surgeons of the time, and the Marian process was at once universally given up.

We can only very briefly indicate the leading steps of the operation. The patient being laid on the table, and chloroform being administered, an instrument termed a curved staff, with a deep groove, is passed into the bladder. An incision is then made on the left side of the mesial line, about an inch and three-quarters in front of the anus, and extending downwards to midway between the anus and the tuberosity of the left ischium. The incision should be sufficiently deep for the operator, on introducing a finger of the left hand, to feel the groove of the staff. The knife, directed by this finger, is now fixed in the groove, and sliding along it towards the bladder, divides the membranous portion of the urethra, the edge of the prostate, and the neck of the bladder. The knife is now withdrawn, as also is the staff, and the surgeon introduces the forceps over the finger of the left hand into the bladder, feels for the stone, and draws it out.

It is unnecessary to enter into any of the details of the after-treatment. At first, the urine escapes through the wound, but in favourable cases it is voided by the natural passage in a week, and the wound heals in the course of a month.

From the shortness of the female urethra and the extent to which it can be dilated, and, additionally, from the comparative rarity of calculous affections in women, the operation of lithotomy is exclusively restricted to the male sex.

The danger of the operation seems to vary with the age of the patient. Out of 186 cases collected by Mr Hutchinson of the London Hospital, 137 were under the age of 20, and of these, 123, or nearly 90 per cent., recovered; while of the 49 who were over 20 years of age, 26, or more than 53 per cent., died.

LITHOTRITY (Gr. *stone-crushing*), the surgical operation of breaking up a stone in the bladder into

such small fragments that they may readily be expelled by the urethra. Although the importance of such an operation has been recognised from the earliest time, a French surgeon, Civiale, who commenced his researches in 1817, but did not perform his first operation till the beginning of 1824, is entitled to be regarded as the discoverer of lithotripsy. The instrument by which the disintegration of the stone is effected, is introduced in the same manner as a catheter or sound into the bladder, and, after catching the stone, either bores, hammers, or crushes it to pieces.

Crushing is now generally preferred, the stone being grasped by the blades of the instrument shewn in the figure, one blade acting on the other by means of a screw.

The process seems, at first sight, so safe, as compared with the operation of lithotomy, that it is necessary to distinguish those cases in which it may be resorted to, and those in which it is contra-indicated. It may be resorted to when the patient is an adult, and the urethra full-sized and healthy, so as freely to admit the passage of the instrument; when the prostate is not much enlarged, which is very often the case in old men, and when the bladder is not thickened or very irritable: while it must be avoided in children, in consequence of the smallness of the urethra; when there is great irritation and thickening of the bladder; when there is great enlargement of the prostate, which hinders the manipulation of the instrument, and the escape of the broken fragments of stone; when the stone is of large size, as, for example, of

a greater diameter than two inches; and when there is reason to believe that the concretion is a mulberry calculus, which, from its extreme hardness, cannot readily be broken. Great care must be taken that no fragment remains in the bladder, as such fragments are almost sure to form the nuclei of fresh calculi.

LITHUANIA, a former grand-duchy, holding of the crown of Poland, which, before the partitions of that country, was composed of three groups of territory: 1. L. proper, or Litva, which formed the governments of Wilna and Troki; 2. The duchy of Samogitia; 3. Russian L., comprising Polesie, Black Russia or Novogrodek, White Russia or Minsk, Meislaw, Witebsk, Smolensk, Polotsk, and Polish Livonia. This country contained about 135,000 English square miles, and was partitioned between Russia and Prussia, the latter receiving what is now denominated the government of Gumbinnen, in East Prussia. The Lithuanians, a race to whom belong the Letts of Livonia, the Cours of Courland, and the ancient inhabitants of East Prussia, are probably a Slavonic people, whose original characteristics have been much modified by time and the intermixture of other races. According to Latham, the Lithuanian language approaches nearer to the Sanscrit than any other member of the Aryan group.

L. was at first subject to Russia, but shook off the yoke about the end of the 12th c., and became an independent power. Their rulers, who bore the title of Grand Duke, conquered the neighbouring Russian provinces, and even carried their ravages to the very gates of Moscow. The Grand Duke of L., Jagellon, was in 1386 elected king of Poland, and issued an edict of union between the two countries, and in 1569 the two were declared to be one country.

LITMUS is a well-known colouring matter, which is obtained from several lichens, but chiefly from *Lecanora tartarea*. The lichens are powdered and digested with ammoniacal fluids (urine, for example) till they undergo decomposition. Alum, potash, and lime are then added, and the mixture is allowed to stand till the maximum degree of colour is observed. Sand and chalk are added, to give a due degree of solidity, and the mass is then dried in cubes, and is ready for the market. The exact nature of the changes which ensue is not altogether known; it is, however, certain that the pigment is originally red, and that it only becomes blue on the addition of alkalies or of lime. This blue colour is again changed into a red, on the addition of a free acid.

The use of litmus-paper and tincture of litmus for the purpose of detecting the acidity of fluids, &c., is known to every student of chemistry. See **TEST-PAPERS**.

LITRE, the unit of the present French measures of capacity, both dry and liquid. It is the volume of a cubic decimetre (see **MÈTRE**), and is equal to 0.2200967 British imperial gallon. It is subdivided decimally into the *decilitre*, *centilitre*, and *millilitre* (respectively $\frac{1}{10}$ th, $\frac{1}{100}$ th, and $\frac{1}{1000}$ th of a litre). Ten litres are a *decalitre*; 100, a *hectolitre*; 1000, a *kilolitre*. The hectolitre is the common measure for grain, and is equal to 0.3439009 British imperial quarter, or nearly $2\frac{1}{2}$ imperial bushels.

LITTLE FALLS, a village of New York, United States of America, on the Mohawk River, 91 miles north-west of Albany, on the line of the Erie Canal, and New York Central Railway. The Mohawk here passes through a romantic defile of two miles in length, with falls of forty-two feet, giving water-power to four paper-mills, two woollen factories, flouring-mills, &c. The village has nine churches, a bank, newspapers, and manufactures of starch, shoes, &c. Pop. in 1860, 5989.

LITTLE ROCK, the capital of Arkansas, United States of America, is situated on the south bank of the Arkansas River, 300 miles from its mouth, on the first bed of rocks bounding the alluvial valley of the Mississippi. It contains the state capitol, an arsenal, penitentiary, and five churches. Founded in 1820. Pop. in 1860, 3727.

LITTLETON, or **LYTTLETON**, **SIR THOMAS**, a celebrated English jurist, was born early in the 15th c. (the exact year is not known), studied—it is thought probable—at Cambridge, after which he removed to the Inner Temple. Henry VI. appointed him steward or judge of the Court of the Palace, and in 1455 king's serjeant, in which capacity he travelled the northern circuit. In 1466, he was made one of the judges of the Court of Common Pleas; and in 1475, he was created Knight of the Bath. He died August 23, 1481. L.'s fame rests on his work on *Tenures*, which was originally written in Norman-French, and first published about the time of his death. It went through a multitude of editions. The first translation into English was made in 1539, and in the course of the next hundred years it went through no less than 24 editions. The changes in the laws relative to property have greatly diminished its value, and it is now little studied by lawyers; yet it is considered a model on account of the clear and logical manner in which the subject is handled.

LITURGY (Gr. *leitourgia*, a public service), in general, signifies a form of prayer and ceremonial established by ecclesiastical authority, to be used in the public services of the church, but is especially applied to that used in the celebration and administration of the Eucharist. The very earliest historical records of Christianity plainly shew that such forms

were in use in the primitive times, but it seems highly probable that for a considerable period they were not reduced to writing; and hence even those of the extant liturgies which represent the earliest forms differ considerably from each other, if not in the substance of the rite, at least in the arrangement even of those parts which are common to them all. A theological discussion of the subject of the liturgy, though, of course, most important in a doctrinal point of view, and most interesting for the study of Christian antiquities, would be out of place in a popular cyclopædia. The liturgies form the great stronghold of the Catholic controversialists on the subject of the real presence and of the eucharistic sacrifice; but we must confine ourselves to a brief historical account of the various liturgies now extant, and of their connection with the various ancient Christian communities, whether of the East or of the West. Liturgies may, indeed, best be distributed into two classes, those of the East, and those of the West.

1. *Oriental Liturgies.*—The Oriental liturgies are six in number, four of which are derived from the great churches in which they were used; the fifth from the Armenian Church, which early formed a distinct liturgy; and the sixth from the great Syrian sect of Nestorius, by which the liturgy was modified to suit its own peculiar tenets. These liturgies are severally known as the liturgies of Jerusalem, of Antioch, of Alexandria, and of Constantinople, the Armenian liturgy, and the Nestorian liturgy. The diversities of these liturgies, although very great in appearance, yet can hardly be said to be substantial. Certain leading parts are common to them all, and are found in all without substantial variation; but they are arranged in a different order, and, except in the form of the eucharistic consecration, the hymn Trisagion, and a few other details, the form of words is often entirely dissimilar. The liturgy of Jerusalem, although ascribed to St James, is of uncertain origin and date; nor is it well ascertained whether its original language was Syriac or Greek. The latter is the language in which it is now found, and the present liturgy closely corresponds in the main with that which formed the text of St Cyril of Jerusalem in his well-known *Mystagogical Lectures*. The liturgy of Antioch exists in Syriac, but it is evidently only a free translation of the liturgy of Jerusalem. The ancient liturgy of Alexandria is ascribed to St Mark; but the existing liturgy has received numberless additions at later dates, and has been modified by both the great sects of this patriarchate to suit their peculiar doctrines. Several other liturgies are in use among the Copts, under the name of St Basil, St Gregory, and St Cyril; and the Abyssinian Christians have no fewer than ten, which are distinct, at least in name. The church of Constantinople has two different liturgies, both of great antiquity, that of St Basil, and that of St Chrysostom. These, however, are not indiscriminately used, each being employed on special occasions or on certain defined festivals. The liturgy of Constantinople is the original of the Slavonic liturgy, which is used in the Russian and Russo-Greek Church, and in its various branches. The Armenian liturgy dates from the introduction of Christianity into Armenia under Gregory the Illuminator. It is in most respects derived from that of St Chrysostom. The Nestorians have three liturgies—the liturgy of the Apostles, the liturgy of Theodore of Mopsuestia, and the liturgy of Nestorius. These, however, are all combined into one, each being assigned to a particular season, or used on special occasions. The language of all is Syriac.

2. *Western Liturgies.*—The liturgies of the West present much less variety, and indeed are all derived

either from the eastern liturgies or from a common source. The Catholic liturgies may be reduced to four—the Roman, the Milanese or Ambrosian, the Gothic or Mozarabic, and the Gallic liturgies. The oldest forms of the Roman liturgy are to be found in three so-called sacramentaries—that of Leo, that of Gelasius, and that of Gregory the Great. It is the last that has left its impress most clearly on the modern Roman missal, which was brought to its present shape by a commission ordered by the Council of Trent, after a careful revision and collation of all the liturgical forms in use in the West in the 16th century. The first revision took place under Pius V., and two subsequent revisions were made by Urban VIII. and Clement VIII. The Ambrosian liturgy is used only in the diocese of Milan, and is popularly traced to St Ambrose. It bears a close analogy to the Roman liturgy, but it has many peculiarities, some of which are highly interesting, as illustrating the history of the details of Christian worship. Its ceremonial, which is observed with great solemnity in the cathedral of Milan, is in some parts highly striking and characteristic. The Gothic or Mozarabic is of still more limited use, being now confined to a single chapel at Toledo, founded and endowed for the purpose by the celebrated Cardinal Ximenes. It is the old liturgy of the Gothic Church of Spain; and after the infusion of the Arabic element, which followed the Moorish invasion, it was called by the name of Mozarabic, a word of disputed etymology. This liturgy is certainly of Oriental origin; but its history, and the time and circumstances of its introduction into Spain, have furnished matter for much speculation. Some parts of the rite are exceedingly curious, especially those which accompany the breaking of the host. The Gallican liturgy has no precise modern representative, and is only known from ancient forms, more or less complete, which have been edited by Mabillon, and recently by Mone. The older Gallican forms bespeak an Oriental origin, and are probably derived from the Greek Christian colony which settled at Marseille, Lyon, and the other churches of the south. The later forms approximate more to the Roman. Neither of these, however, is to be confounded with the more modern missals in use in several of the French dioceses, which do not differ from the Roman except in minor details, and most of which have now been displaced by the Roman missal. Of Protestant communities, the Anglican Church alone professes to follow the ancient liturgical forms (see *COMMON PRAYER, BOOK OF*). See Renaudot's *Orientalium Liturgiarum Collectio*, 1740, 2 vols.; Assemani's *Bibliotheca Orientalis*; Palmer's *Antiquities of the English Liturgy*; Binterim's *Denkwürdigkeiten der Christ-Katholischen Kirche*.

LITURGY, JEWISH, in the narrower sense of a ritual of fixed prayers, chiefly for public worship. The Mosaic records contain an ordinance respecting the 'confession of sins' (Lev. v. 5; xvi. 21), without, however, prescribing a distinct form for the purpose. Three formulas only are fixed—the benediction of the priests (Num. vi. 24–26), the prayer of thanksgiving on the occasion of the first offering (Deut. xxi. 5–10), and that which was to accompany the offering up of the third year's tithe, beginning: 'I have brought away the hallowed things out of my house' (ib. 13–15). Although prayers are often mentioned before the Exile, yet they do not seem, except in the cases mentioned, to have been introduced as yet as a regular element into the service of the Temple. The songs of the Levites (1 Chr. xvi. 4; xxiii. 3), and occasional prayers, such as are to be found in the Psalms, or like that of Solomon at the inauguration of the Temple, are all we find recorded. Private devotions

were common (cf. 1 Kings, viii. 30, &c.; Is. i. 15), but every one prayed when his heart prompted him in the words inspired by his joy or sorrow. Not before the time of Daniel is a fixed institution of three daily prayers mentioned (Dan. vi. 11). The task of compiling a liturgy proper, and of fixing the times and seasons of prayer, was probably first undertaken by the men of the Great Synagogue. Two chief groups around which, as time wore on, an enormous mass of liturgical poetry has clustered, are distinctly discernible—the one, the *Shemah*, ('Hear, Israel, &c.'), being a collection of the three biblical pieces (Deut. vi. 4–9; xi. 13–21; Num. xv. 37–41) expressive of the unity of God and the memory of His government over Israel, strung together without any extraneous addition; the second, the *Tefillah*, or Prayer, by way of eminence (adopted into Islam as *Salat*, Sur. ii. 40; cf. v. 15), consisting of a certain number of supplications with a hymnal introduction and conclusion, and followed by the priestly blessing. The single portions of this prayer gradually increased to eighteen, and the prayer itself received the name *Shemonah Ezer* (Eighteen). The first additions to the *Shemah* formed the introductory thanksgiving for the renewed day, in accordance with the ordinance that every supplication must be preceded by a prayer of thanks, called *Jozer* (Creator of Light, &c.), to which were joined the *three Hoshes* (*Osem*), and the supplication for spiritual enlightening in the divine law (*Ahaba*). Between the *Shemah* and the *Tefillah* was inserted the *Gedulah* (Liberation), or praise for the miraculous deliverance from Egypt and the constant watchings of providence. A *Kaddish* (Sanctification), and certain psalms, seem to have concluded the service of that period. This was the order of the *Shaharit*, or morning prayer; and very similar to this was the *Maarib*, or evening prayer; while in the *Minka*, or afternoon prayer, the *Shemah* was omitted. On new moons, Sabbath and feast days, the general order was the same as on week days; but since the festive joy was to overrule all individual sorrow and supplication, the intermediate portion of the *Tefillah* was changed according to the special significance and the memories of the day of the solemnity, and additional prayers were introduced for these extraordinary occasions, corresponding to the additional sacrifice in the temple, and varying according to the special solemnity of the day (*Musaf*, *Nellah*, &c.). The first compilation of a liturgy is recorded of Amram Gaon (870–880 A. D.); the first that has survived is that of Saadja Gaon (d. 942 A. D.). These early collections of prayers generally contained also compositions from the hand of the compiler, and minor additions, such as ethical tracts, almanacs, &c., and were called *Siddurim* (Orders, Rituals), embracing the whole calendar year, week-days and new moons, fasts and festivals. Later, the term was restricted to the week-day ritual, that for the festivals being called *Machzor* (Cycle). Besides these, we find the *Selichoth*, or Penitential Prayers; *Kinuth*, or Elegies; *Hoshanah*, or Hosannas (for the seventh day of the Feast of Tabernacles); and *Bakashoth*, or Special Supplications, chiefly for private devotion.

The public prayers were for a long time only said by the public reader (*Chazan*, *Sheliach Zibbur*), the people joining in silent responses and amens. These readers by degrees—chiefly from the 10th c.—introduced occasional prayers (*Psalm*) of their own, over and above those used of yore. The materials were taken from Halacha (q. v.) as well as from Haggada (q. v.); religious doctrine, history, saga, angelology, and mysticism, interspersed with biblical verses, are thus found put together like

a mosaic of the most original and fantastic, often grand and brilliant, and often obscure and feeble kind; and the pure Hebrew in many cases made room for a corrupt Chaldaea. We can only point out here the two chief groups of religious poetry—viz., the Arabic on the one, and the French-German school on the other hand. The most eminent representative of the Pajtanic age (ending c. 1100) is Eleazar Birihi Kalir. Among the most celebrated poets in his manner are Meshulam b. Kalonymos of Lucca, Solomon b. Jehuda of Babylon, R. Gerson, Elia b. Menahem of Mans, Benjamin b. Serach, Jacob Zom Elem, Eliezer b. Samuel, Kalonymos b. Moses, Solomon Isaaki. Of exclusively Spanish poets of this period the most brilliant are—Jehuda Halevi, Solomon ben Gabirol, Josef ibn Abitur, Isaac ibn Giat, Abraham ibn Ezra, Moses b. Nachman, &c. When, however, in the beginning of the 13th c., secret doctrine and philosophy, casuistry and dialectics, became the paramount study, the cultivation of the Piut became neglected, and but few, and for the most part insignificant, are the writers of liturgical pieces from this time downwards.

According to the different countries, the order and even the contents of the cycle differed, since not all liturgical pieces had been incorporated uniformly. We have thus—to name a few out of many—the rituals of Germany (Poland), of France, Spain, and Portugal (Sefardim), Italy (Rome), the Levant (Romagna), and even of some special towns, like Avignon, Carpentras, Montpellier. The rituals of Barbary (Algiers, Tripoli, Oran, Morocco, &c.) are of Spanish origin. The Judæo-Chinese liturgy, it may be observed by the way, consists only of pieces from the Bible. The Jewish liturgy has, in its various forms, very frequently been commented upon, and has been translated into nearly every modern language.

We may add, in conclusion, that Liturgy forms at this moment the centre of a great contest within the pale of Judaism. The 'reformers' of more or less advanced tendencies are intent upon shortening the prayers, and principally upon abrogating the greater part of the Piut, as an artificial excrescence hurtful to true devotion.

LIUTPRAND, or LUITPRAND, an author to whom we owe much of our knowledge of the history of the 10th c., was born in Italy about the year 922. He was educated at the court of King Hugo, and entered into the service of his successor, Berengarius; but falling into disgrace at court about 955, resided for some years at Frankfurt-on-the-Maine, followed the Emperor Otto I. to Italy in 961, and was made Bishop of Cremona, and afterwards sent on an embassy to Constantinople. He died about 970. His *Antapodosis* treats of the period from 886 to 948. He wrote also *De Rebus Gestis Ottonis Magni Imperatoris*, and *De Legatione Constantino-politana*. The best edition of his works is that in the third volume of the *Monumenta Germaniae Historica* (Hanov. 1839). Compare K pke, *De Vita et Scriptis Liutprandi* (Berl. 1842).

LIVADIA, the name given under the Turkish r gime to the ancient Hellas (q. v.) or Greece (q. v.) north of the Morea.

LIVADIA (ancient, *Lebadeia*), a town of Greece, nomarchy of Attica and Boeotia, is situated on the little stream Hercyna, about 60 miles north-west of Athens, and three miles west of the Copaic Lake. Pop. 5000. Here are the famous cave and oracle of Trophonius, and the fountains of Lethe and Mnemosyne.

LIVER, THE, is the largest gland in the body; it weighs from three to four pounds, and measures

LIVER.

about twelve inches from side to side, and six or seven inches from its anterior to its posterior border. It is situated in the right hypochondriac region, and reaches over to the left; being thick and indented behind, where it crosses the convex bodies of the vertebrae; convex on its upper surface, where it lies in the concavity of the diaphragm; and concave below, where it rests against the stomach, colon, and right kidney. This lower surface presents a fissure dividing the organ into a right and a left lobe.

The liver is retained in its position by five ligaments. Besides the right and left lobe, there are

duct from the neck of the gall-bladder (presently to be described) enters, and the two combine to form the common duct (*Ductus communis choledochus*), which opens into the duodenum (see *DIGESTION*). This common excretory duct of the liver and gall-bladder is about three inches in length, and of the diameter of a goose-quill.

The chemical composition of the liver has been studied by Dr Beale, who finds that the organ in health contains 68.6 per cent. of water, and 31.4 per cent. of solid constituents—of which 3.8 are fat, 4.7 albumen, while the rest is made up of vessels, salts, and extractive matters. (In the diseased condition known as fatty degeneration of the liver—which, by the way, is artificially induced in the geese which contribute to the formation of Strasburg Pie, or *pâté de foie gras*—the fat is enormously increased; in one remarkable case analysed by Dr Beale, it amounted to 65.2 per cent. of the whole weight of the organ.) Sugar, varying in amount from 1 to 2 per cent., is also found; and inosite, uric acid, sarcosine, xanthine, and leucine usually occur in traces.

The gall-bladder may be regarded as a *diverticulum* or offshoot from the hepatic duct. It has somewhat the shape of a pear, and lies in a depression on the under surface of the liver. Its use seems to be to serve as a reservoir for the accumulation of the bile, when its flow into the intestine is interrupted, as it is always found full after a long fast, and empty when digestion is going on. That the gall-bladder is not an essential appendix to the liver, is shown by the fact that it is absent in many genera of mammals. Thus, it is present in the ox, sheep, and goat, but absent in the horse and many other herbivora.

It was formerly believed that the liver served merely for the separation of the biliary secretion from the blood; but there is now abundant evidence that the blood itself is changed by its means, in such a way as to show that this gland possesses an *assimilating* as well as a *depurating* action. Thus, the albuminous matter contained during digestion in the blood of the veins which pass from the intestine to the portal vein (the mesenteric veins), is very different from the albuminous matter contained in the hepatic veins; the blood, before reaching the liver, containing a crude albuminous product, while the hepatic veins contain only true blood-albumen. That the liver possesses an assimilating power on albuminous substances is also shown by the experiments of Claude Bernard, who found that if a solution of egg-albumen be injected into any part of the systemic circulation, albumen speedily appears (like other soluble substances which are foreign to the body) in the urine, and is eliminated as an extraneous matter; but if it be injected into the portal vein, it does not appear in the urine, but becomes a normal constituent of the blood (blood-albumen), through the agency of the liver. It is now also known, that if the liver does not secrete a true sugar, as Bernard supposed, it at all events secretes a substance closely allied to, and readily convertible into sugar—viz., Glycogen (q.v.)—which must be regarded as a respiratory or heat-forming food. Further, it appears from Bernard's researches that fatty matters are elaborated in the liver—the blood of the hepatic veins which leave the liver containing considerably more fat than that of the portal vein which enters it. Some of this fat is doubtless burned off in the lungs; but if a deficient supply should be introduced by the lacteals, some of it would doubtless be applied to the formative processes. Lastly, during the last three days of incubation of the chick, the liver is made bright-yellow by the absorption of the yolk, which enters

The Liver :

A, right lobe; B, left lobe; a, depression for colon; b, depression for right kidney and capsule; cc, coronary ligament, inferior layer; dd, surface uncovered by peritoneum; e, gall-bladder; ff, fissure for gall-bladder; gg, transverse fissure; h, lobulus quadratus; i, umbilical vein; j, hepatic duct; k, hepatic artery; l, ductus venosus; mm, fissure for ductus venosus; n, vena portæ; o, lobulus caudatus; p, lobulus Spigelii; q, inferior vena cava; r, fissure for inferior vena cava; ss, longitudinal fissure.

three smaller lobes. The great bulk of the organ is, however, made up of the right lobe, which is six times as large as the left.

The vessels of the liver are the hepatic artery, which comes off from the Coeliac Axis (q.v.), and supplies the organ with nutrient blood; the Portal Vein, which conveys to the liver the venous blood of the intestines, spleen, and stomach, and from which (after the vessel has ramified like an artery) the bile is secreted;* the hepatic veins, which convey the blood from the liver into the inferior vena cava; the hepatic duct, which carries off the bile from the liver; and the lymphatics.

The liver, both on its surface and internally, is of a dark reddish tint, which is so well known that the term *liver-coloured* is universally recognised. The substance of the organ is composed of lobules held together by extremely fine areolar tissue, and ramifications of the minute branches of the various hepatic vessels. Each lobule is composed of a mass of hepatic cells, of a plexus of biliary ducts, of a portal plexus (from the contents of which the cells obtain the biliary matters that are found in their interior), of a branch of the hepatic vein, and of minute arteries. The exact mode in which the bile formed in the cells makes its way into the origin of the ducts, is not known with certainty. The numberless minute ducts gradually run into one another, until, as they emerge from the lower surface of the liver, they are reduced to two large trunks, which soon unite (see fig.) to form the hepatic duct. Into the hepatic duct, the cystic

* Recent investigations throw doubt on this view, and there are reasons for believing that the bile is secreted from the capillaries of the hepatic artery, while the portal blood contributes the material from which the liver-sugar or glycogen is formed or secreted.

LIVER—LIVERPOOL.

the branches of the portal vein, and is then converted partly into *blood-corpuscles*, which enter the circulation, and partly into bile, which is discharged into the intestine. Hence, there is distinct evidence, from several points of view, that the liver is an *assimilating* organ. The *depurating* action of this organ is exhibited in the secretion of Bile (q. v.), by which the hydro-carbonaceous portion of the effete matters of the blood is removed, just as the nitrogenous portion is eliminated by the kidneys. The use of the bile in the digestive process is sufficiently explained in the article *DIGESTION*.

Our limited space does not allow of our noticing at any length the comparative anatomy of this important gland, which first shews itself in the form of yellowish-brown cells in the polypes, and gradually becomes more concentrated and developed in the echinoderms, annelides, nudobranchiate gastropods, insects, crustaceans, air-breathing molluscs, cephalopods, fishes, reptiles, birds, and mammals. Till we arrive at the vertebrated classes, it consists of tubes or follicles containing cells, which stand to them in the relation of an epithelium, and its structure is easily made out; but when, as in the vertebrata, it is mainly composed of a solid parenchyma, made up of lobules, each of which is composed of aggregations of cells surrounded by the alternate ramifications of the ducts and other vessels, it presents an anatomical complexity which it is almost impossible to unravel.

LIVER, DISEASES OF THE. Congestion of the liver is one of the most frequent of its morbid conditions. It is most commonly caused by obstruction to the passage of the blood from the hepatic veins, arising from thoracic disease impeding the circulation through the right side of the heart. The congestion may be relieved at this stage, or may, by its obstructive action, cause congestion of the portal branches, in which case we have the liver much enlarged, the complexion dusky, the urine high coloured, sedimentary, and scanty, and often more or less dropsey of the abdomen or lower extremities. The treatment must be left entirely to the physician.

Inflammation of the liver has been already noticed in the article *HEPATITIS*.

Another important affection of the liver is that which is known by the name of *Cirrhosis* (Gr. *kirrhos*, yellowish). It begins as an inflammatory affection, in which lymph (see *INFLAMMATION*) is effused in the areolar tissue surrounding the branches of the portal vein. The smaller branches become obliterated by the pressure, and as the lymph subsequently contracts, larger branches of the veins and ducts become strangulated, and the surface of the organ assumes the uneven or bossed appearance known as *hob-nailed*. In this affection, the liver is at first somewhat enlarged, but as the contraction of the effusion goes on, it at length becomes considerably smaller than the natural size. The ordinary cause of this disease is spirit-drinking, and it is popularly known as the *gin-drinker's liver*. The obstruction to the portal circulation occasions the effusion of serum into the peritoneal cavity; and this effusion often goes on so rapidly as soon to force up the diaphragm and impede respiration. The lower extremities soon become anasarcoous, but the arms and face are never affected. The portal obstruction often also gives rise to hemorrhage from the bowels or stomach.

In a fully developed case of cirrhosis, the liver is so altered in structure that palliative treatment is all that can be attempted. This must be directed to the relief of the dropsey, and if medicines fail to remove or diminish it, temporary relief may be obtained by tapping. The disease is at best a very hopeless one.

Amongst the other affections of this organ are the *fatty liver*. The liver in this case is much enlarged, of a white colour, and rounded at the edges; it is most commonly found associated with phthisis. Closely allied to this is the *lardaceous* or *waxy* liver, in which the deposited matter is not fat, but something between fat and albumen; it chiefly occurs in scrofulous young persons. Tubercle, different forms of cancer, and Hydatids (q. v.) are not unfrequently found in this organ. In connection with the present subject, the reader is referred to the article *JAUNDICE*.

LIVERPOOL, situated on the north bank of the Mersey, Lancashire, is, after London, the largest town in the United Kingdom, and, taken in connection with Birkenhead, on the opposite side of the Mersey, it ranks in maritime importance before the metropolis itself—a circumstance due to its position on the west coast of England, not only as a port for the adjacent manufacturing districts, but for the traffic with America. It is situated at one hour's distance by railway from Manchester, six hours from London and Edinburgh, and eight hours by steam from Dublin. The rise of Liverpool is remarkable. In the middle of the 14th c., it contained only 840 inhabitants and 168 cottages; whilst in 1561 its population was only 690. It was not until 1647 that it was made a free port (having been subject down to that date to the Chester officers); whilst its distinct individuality as a parish was not declared until 1697, when its population numbered about 5000 souls, and its shipping about 80 vessels. Between 1710 and 1760, its population increased from 8160 to 25,790; and its commercial navy from 84 vessels to 1245 vessels. In 1700, its first regular dock was built, on the site where the Custom-house stands at the present day. From 1760 to 1800, the population advanced from 25,700 to 77,700 inhabitants; the shipping from 1200 vessels to 5000 vessels; and the amount of dock dues collected, from £2300 to £28,300; nearly two-thirds of the increase taking place during the last 15 years of the period. The rapid progress of the cotton trade was the chief cause of this almost sudden improvement. Simultaneously with the mechanical revolution brought about by Hargreaves, Arkwright, Crompton, and others, there came an increased foreign trade, and an augmented inland business, owing to the opening of the Bridgewater Canal in 1773. About the same period, too, a great start was given to the ship-building trade of the port, by several extensive orders received from the government: some 15 vessels of war being launched between 1777 and 1782, of very considerable tonnage, and ranging between 16 and 60 guns. By this time, L. had far outstripped Bristol in commercial importance: the trade of the latter port being in process of rapid transference to the former. The following statement will shew how far L. was benefited by the cotton trade:

Years.	Raw Cotton.		Cotton Manufactures.	Population.	Vessels.	Dock Duties Collected.
	Imported. lbs.	Exported. lbs.	Exported. lbs.	No.	No.	£
1781	5,196,778	96,788	355,000	35,000	2300	5,000
1791	31,447,605	363,443	1,875,000	50,000	4200	10,000
1800	43,378,378	4,416,610	6,040,000	77,000	5000	28,000

LIVERPOOL.

But this progress, important as it was, has been far exceeded by the subsequent increase of business, and at the present time L. stands at the head of British commercial ports, and has no equal in the world. Its rapid growth will be seen from the following table :

Years.	Population.	Vessels.	Tonnage.	Dock Dues.
1801	77,708	5,080	460,719	£28,365
1831	205,572	12,537	1,599,436	183,455
1861	443,938	21,096	4,977,373	444,417

The following table will shew that the export trade of L. is nearly equal to the entire trade of the remaining ports of the United Kingdom :

DECLARED REAL VALUE OF BRITISH AND IRISH PRODUCE AND MANUFACTURES EXPORTED IN 1860.

	Total.	Per Cent. of Whole.
From Liverpool,	£65,419,732	46-14
" London,	30,837,688	22-69
" Hull,	14,356,787	10-57
" Glasgow,	5,469,308	4-05
" Hartlepool,	4,631,236	3-40
" Southampton,	2,662,076	1-96
" Newcastle,	1,903,489	1-40
" Cardiff,	1,685,631	1-25
" Leith,	1,050,680	77
" Folkestone,	1,044,494	77
" All others,	6,768,577	5-00
Total from the United Kingdom,	135,891,227	100-00

This gigantic trade has given being to a magnificent system of docks, extending along the margin of the river for a distance of about 5 miles, containing 43 docks and basins, covering an area of over 700 acres, and having nearly 17 miles of quay space. The whole of these docks have, with the exception of the Salthouse, King's, part of the George's, and part of the Queen's, been built since 1812. They were erected chiefly under the superintendence of the late Jesse Hartley, Esq., and are considered by all who have seen them to be one of the greatest engineering triumphs of the present century. Several of the docks are enclosed with large warehouses : the erection of those round the Albert Dock cost £368,000, and the dock itself £141,000. In addition to the usual pier approaches there are two large floating landing-stages, one of which is 1002 feet in length, 82 feet in width, and 4500 tons in weight. In the general traffic of L., that carried on by large steam-vessels with New York, Boston, Halifax, and other ports on the American continent, has deservedly attained celebrity, and draws large numbers of passengers to the town.

The approaches to the town on the land sides are the Lancashire and Yorkshire, East Lancashire, London and North-Western, and Great Northern Railways. There are three tunnels under the town in connection with the London and North-Western Railway, taking different directions, varying from a mile and a half to two miles and a half in length. The passenger stations in Lime Street and Tithebarn Street are large and handsome buildings ; the latter is raised on arches at a considerable elevation from the level of the town.

The architecture of the town has been wonderfully improved within the past quarter of a century, and especially during the last ten years of the period, and it now possesses many fine thoroughfares, thronged with numerous splendid edifices. There are several large and elegant squares in the east, or fashionable part of the town, and a number of thoroughfares, lined with the private residences of the merchants and tradesmen ; whilst the outskirts of the town are studded with the mansions of the commercial aristocracy. Of what may be termed the official buildings—the Town Hall, St

George's Hall, Custom-house, Sailors' Home, Police-offices, Workhouses, Baths and Wash-houses, Water-works, and Gas Offices, are the most noteworthy ; next follow the various literary and educational edifices, such as the Free Library and Museum, presented to the town by Sir William Brown, at a cost of something like £40,000 ; Botanic and Zoological Gardens, Observatory, the Collegiate Institution, Queen's College, Medical Institute, Royal Institution, the various schools attached to the national and other churches, Society of Fine Arts, Academy of Fine Arts, Egyptian Museum, the Exchange, Lyceum, and Athenæum, newsrooms and libraries, and numerous associations devoted to commercial, political, and religious affairs. That the inhabitants are not niggardly, is proved by the fact that there are no less than 96 charitable institutions in the borough devoted to the alleviation of the various evils that flesh is heir to. Amongst the more prominent are the Royal Infirmary, Northern and Southern Hospitals, Industrial Schools, Blue Coat Orphan Schools, Male, Female, and Infant Orphan Asylums and Church ; School, Workshops, and Church for the Blind ; Deaf and Dumb, and Eye and Ear, Institutions ; Homoeopathic and other dispensaries ; Lying-in and other hospitals. Visitors will find no lack of hotel accommodation, with such immense establishments as the Adelphi, Washington, Waterloo, Queen's, Grand Junction, Royal, Angel, and a score or two of minor importance. The buildings dedicated to amusements are quite in keeping with the other characteristics of the town. Under this head, there are the Philharmonic Hall, capable of accommodating 3000 people ; the Amphitheatre, calculated to hold 5000 ; the two concert-rooms of St George's Hall, before alluded to, the larger of which is acknowledged to be one of the finest rooms in the kingdom ; the Theatre-Royal ; Prince of Wales' Theatre ; Adelphi Theatre ; Hengler's Circus, &c. The religious wants of the community are supplied by about 150 churches and chapels, of which 48 belong to the Established Church, 14 to Roman Catholics, 21 to Presbyterians, 16 to Wesleyans, 15 to Independents, 11 to Baptists, and 25 to miscellaneous Nonconformists, including 3 Unitarian, 2 Jewish, 1 German, and 1 Greek. There are eight cemeteries, one only of which is situated within the town, namely, St James's, Duke Street, the remainder being laid out in the suburbs.

The buildings devoted to commercial pursuits are also very fine and numerous, and not the least interesting to the stranger. Amongst these are the Exchange, the Albany, Apsley, Brown's, Richmond, Hargreaves (the last three recently erected by Sir William Brown), Liverpool and London Insurance Chambers, Royal Insurance, and Queen Insurance buildings (all local companies), Royal Bank, Walmer, Drury, Tower, India, and Brunswick buildings, and many others. There are 13 banks in the town, besides two or three others just started, and several of them are possessed of very large and handsome business premises. Amongst these may be named the branch of the Bank of England, and the Royal Liverpool, Union, District, Commercial, and North and South Wales banks. In the principal streets there are also several very extensive trade establishments, second to none out of London, and devoted to every department of business, wholesale and retail. Of monuments the chief are those of Nelson, Wellington, Huskisson, and William IV., besides several in the Town Hall, St George's Hall, Free Library, and parks. The parks are two in number, the Prince's in Toxteth, and the Botanic, Wavertree.

The stated market days are Wednesday and Saturday, for general agricultural produce, and

Tuesday and Friday for corn. The fairs for horses and cattle are held July 25th and November 11th. The corn trade transacts its business in the Corn Exchange, Brunswick Street, and there is an extensive market for the cattle-dealers in Kensington. For edibles of all kinds there are St John's Market, 183 yards long, 43 yards wide, and lighted by 136 windows; St James's, Gill Street, and St Martin's markets; there is also a fish market, and several fancy bazaars.

There are 4 daily and 9 weekly newspapers, besides the *Daily Telegraph* and *Bill of Entry*, exclusively devoted to shipping matters, and two weekly literary periodicals.

In general industry, there are several extensive ship and boat-building yards, iron and brass foundries, chain-cable and anchor smithies, steam-engine workshops, tar and turpentine distilleries, rice and flour mills, saw-mills, cigar manufactories, breweries, sugar refineries, soap manufactories, roperies, glass works, alkali works, chronometer and watch manufactories.

LIVERY, in English Law, denotes the act of giving or taking possession. It is most frequently used in the phrase 'livery of seisin,' corresponding to the Scotch infefment or sasine.

LIVERY (from Lat. *liberatio*), a word applied in its origin to the custom which prevailed under the Merovingian and Carolingian kings, of delivering splendid habits to the members of their households on great festivals. In the days of chivalry, the wearing of livery was not, as now, confined to domestic servants. The duke's son, as page to the prince, wore the prince's livery, the earl's son bore the duke's colours and badge, the son of the esquire wore the livery of the knight, and the son of the gentleman that of the esquire. Cavaliers wore the livery of their mistresses. There was also a large class of armed retainers in livery attached to many of the more powerful nobles, who were engaged expressly to use the strong hand in their masters' quarrels. By the colours and badge of the retainer was known the master under whom he served. The livery colours of a family are taken from their armorial bearings, being generally the tincture of the field, and that of the principal charge, or the two tinctures of the field are taken instead, where it has two. They are taken from the first quarter in case of a quartered shield. These same colours are alternated in the Wreath (q. v.) on which the crest stands. The royal family of England have sometimes adopted colours varying from the tinctures of the arms. The Plantagenets had scarlet and white; the House of York, murrey and blue; white and blue were adopted by the House of Lancaster; white and green by the Tudors; yellow and red by the Stuarts, and by William III.; and scarlet and blue by the House of Hanover. An indispensable part of the livery in former times was the Badge (q. v.). The Church of Rome has its liveries for apostles, confessors, martyrs, virgins, and penitents.

The freemen of the 91 guilds or corporations which embrace the different trades of London, are called liverymen, because entitled to wear the livery of their respective companies. In former times the wardens of the companies were in use yearly to deliver to the Lord Mayor certain sums, twenty shillings of which was given to individuals who petitioned for the money, to enable them to procure sufficient cloth for a suit, and the companies prided themselves on the splendid appearance which their liveries made in the civic train. The common-councilmen, sheriffs, aldermen, and some other superior officers of the city, are elected by the liverymen of London; and down to the passing of

the Reform Bill in 1832, they had the exclusive privilege of voting at the election of the members of parliament for the City.

LIVINGSTONE, DAVID, African traveller and missionary, is a native of Scotland, and was born at Blantyre, in Lanarkshire, in the year 1817. At the age of ten he became a 'piecer' in a cotton-factory, and for many years was engaged in hard work as an operative. An evening school furnished him with the opportunity of acquiring some knowledge of Latin and Greek, and, finally, after attending a course of medicine at Glasgow University, and the theological lectures of the late Dr Wardlaw, professor of theology to the Scotch Independents, he offered himself to the London Missionary Society, by whom he was ordained as a medical missionary in 1840. In the summer of that year he landed at Port Natal in South Africa. Circumstances made him acquainted with the Rev. Robert Moffat (q. v.), himself a distinguished missionary, whose daughter he subsequently married. For 16 years L. proved himself a faithful and zealous servant of the London Missionary Society. The two most important results achieved by him in this period were the discovery of Lake Ngami (August 1, 1849), and his crossing the continent of South Africa, from the Zambesi (or Leeambye) to the Congo, and thence to Loando, the capital of Angola, which took him about 18 months (from January 1853 to June 1854). In September of the same year he left Loando on his return across the continent, reached Linzanti (in lat. 18° 17' S., and long. 23° 50' E.), the capital of the great Makololo tribe, and from thence proceeded along the banks of the Leeambye to Quillimane on the Indian Ocean, which he reached May 20, 1856. He then took ship for England, where he arrived December 12th of the same year. The reception accorded him by his countrymen was most enthusiastic. Probably no traveller was ever more affectionately honoured. This was owing not merely to the importance of his discoveries—though it would be difficult to overestimate such—but to the thoroughly frank, ingenuous, simple, and manly character of the traveller. In 1857, L. published his *Missionary Travels and Researches in South Africa*, a work of great interest and value. 'In all his various journeys,' said Sir Roderick Murchison, at a meeting of the Royal Geographical Society, held shortly after L.'s return, 'he had travelled over no less than 11,000 miles of African territory . . . By his astronomical observations he had determined the sites of numerous places, hills, rivers, and lakes, nearly all of which had been hitherto unknown, while he had seized upon every opportunity of describing the physical features, climatology, and geological structure of the countries which he had explored, and had pointed out many new sources of commerce as yet unknown to the scope and the enterprise of the British merchant.' In 1858, the British government appointed him consul at Quillimane, whither he returned in the course of the year. A portable steam-boat has been constructed for his use in this country, and L., with several scientific associates, and a crew of natives, started a few years ago up the Zambesi, with the view of making discoveries in the unexplored territory south of the equator. Accounts of his progress are occasionally received—the latest dating June 20, 1863, from which it appears that L. was (on February 27) near Murchison Falls, on the Zambesi, bent on the further exploration of the great Lake Nyassa.

LIVIUS, TRUVS, the most illustrious of Roman historians, was born at Patavium (Padua), in 61

B.C., according to Cato, but, according to Varro, in 59 B.C., the year of the great Cæsar's first consulship. We know nothing of his early life, except that for some time he practised as a rhetorician, and wrote on rhetoric. There is internal evidence, well handled by Niebuhr, which makes it probable that he did not commence his great historical work till he was drawing near middle age. He had ample time to finish it, for he lived to see his eightieth year; and having been born under the republic, died under Tiberius. His fame was so thoroughly established and widely spread, even during his lifetime, that a Spaniard travelled from Gades to Rome only to see him. Quintilian, in claiming for the Romans equal merit in the department of history with the Greeks, compares L. to Herodotus, and there is no doubt that his countrymen regarded him as their greatest historical writer. The story that Asinius Pollio pretended to discover a certain provincialism or *Patavinity* in his style, is probably false; but even if it be true, modern criticism is unable to discover in what the peculiarity consisted; for L.'s work is one of the greatest masterpieces of Latin, or of human composition. Originally, the Roman history of L. was comprised in 142 books, divided into *tens* or *decades*; but only 30 books, with the greater part of 5 more, now exist. Instead of a complete narrative from the foundation of the city to the historian's own time, we have detailed portions, the most valuable of which are the first decade, containing the early history, and the third containing the wars with Hannibal. Among the surviving fragments of what is lost, is a character of Cicero, preserved in the *Suasoria* of Seneca, the execution of which makes us deeply regret that time has not spared L.'s account of the transactions of his own period.

In classing L. in his proper place among the great historians of the ancient and modern world, we must not think of him as a critical or antiquarian writer—a writer of scrupulously calm judgment and diligent research. He is pre-eminently a man of beautiful genius, with an unrivalled talent for narration, who takes up the history of his country in the spirit of an artist, and makes a free use of the materials lying handiest, for the creation of a work full of grace, colour, harmony, and a dignified ease. Professor Ramsay has remarked, that he treats the old tribunes just as if they were on a level with the demagogues of the worst period; and Niebuhr censures the errors of the same kind into which his Pompeian and aristocratic prepossessions betrayed him. But this tendency, if it was ever harmful, is harmless now, and was closely connected with that love of ancient Roman institutions and ancient Roman times which at once inspired his genius, and was a part of it. And the value of his history is incalculable, even in the mutilated state in which we have it, as a picture of what the great Roman traditions were to the Romans in their most cultivated period. The literary talent most conspicuous in L. is that of a narrator, and the English reader perhaps derives the best idea—though it is but a faint one—of his quality, from the histories of Goldsmith, or the *Tales of a Grandfather* of Sir Walter Scott. He does not rival Tacitus in portraiture or in tragic power, but no writer has ever surpassed him in the art of telling a story; and the speeches which, according to the antique fashion, he puts into the mouths of his historic characters, are singularly ingenious, pointed, and dramatically real. There is also something in a high degree winning and engaging about what we may call the moral atmosphere of L.'s history, which nobody can read without feeling that the historian had a kindly tender disposition—a large, candid, and generous

soul. The *editio princeps* of L., which did not contain all that we now have of the work, was published at Rome about 1469, and MSS. of parts of L. were existing in that century which have since disappeared. The most celebrated editions are those of Gronovius, Crevier, Drakenborch, and Ruddiman; and, in recent times, esteemed recensions of the text have been issued by Madvig, Alschefski, and Weissenborn.

LIVIVS ANDRONICUS, the father of Roman dramatic and epic poetry, was a Greek by birth, probably a native of Tarentum, and flourished about the middle of the 3d c. B.C. He translated the *Odyssey* into Latin Saturnian verse, and wrote tragedies, comedies, and hymns after Greek models. Mere fragments are extant, of which a collection may be found in Bothe's *Poetae scenici Latini* (vol. 5, Halberst, 1823); and Düntzer's *Livii Andronici Fragmenta Collecta et Illustrata* (Berlin, 1835).

LIV'NY, an ancient district town of Great Russia, in the government of Orel, in lat. 52° 25' N., long. 37° 37' E. Pop. 10,838, who carry on an extensive trade in corn, cattle, and honey.

LIVONIA, one of the three Baltic provinces of Russia, to which belong also the islands of Oesel, Man, and Runo, contains an area of 17,698 square miles, with a population of 883,681. The country is mostly flat, and one-fourth of it is covered with wood. The soil is only of moderate fertility; but nevertheless agriculture, and cattle and sheep breeding, are brought to a high degree of perfection. L. has many extensive factories and distilleries belonging to the government, also some cloth manufactories, one of which, situated near Pernau, is very extensive. The inhabitants of the country are of Finnish and Lettish descent; those in the towns are chiefly Germans, with a slight sprinkling of Russians, Poles, and Jews. L., up till the 17th c., included the three modern Baltic provinces of Courland, Livonia, and Esthonia.

LIVRE, the name of an ancient French coin, derived from the Roman *Libra*, or *As* (q. v.). There were livres of different values, the most important being the *Livre Tournais* (of Tours), which was considered the standard, and the *Livre Paris* (of Paris), which was equal to $\frac{2}{3}$ ths of a livre Tournais. In 1795, the livre was superseded by the franc (80 francs = 81 livres Tournais).—LIVRE was also the ancient French unit of weight, and was equal to 17.267 oz. avoirdupois; the kilogramme (see GRAMME) has taken its place.

LIXIVIA'TION (Lat. *lix*, ashes), a term employed in chemistry to denote the process of washing or steeping certain substances in a fluid, for the purpose of dissolving a portion of their ingredients, and so separating them from the insoluble residue. Thus, wood-ash is lixiviated with water to dissolve out the carbonates of soda and potash from the insoluble parts. The solution thus obtained is called a *lixivium*, or *ley*.

LI'ZARD (*Lacerta*), a genus of saurian reptiles, the type of a numerous group, in which *Monitor* (q. v.), &c., are included, and to which the *Megalo-saurus* and other large fossil saurians are referred. The name L. is indeed often extended to all the saurian reptiles; but in its more restricted sense it is applied only to a family, *Lacertidae*, none of which attain a large size, whilst most of them are small, active, brilliantly coloured, and bright-eyed creatures, loving warmth and sunshine, abundant chiefly in the warmer parts of the Old World. They have a long, extensible, forked tongue; the body is generally long, and terminates in a rather long tail. The feet have each five toes, furnished with claws.

the upper parts are covered with small imbricated scales; the scales of the under parts are larger; a collar of broad scales surrounds the neck; the bones of the skull advance over the temples and orbits; the back part of the palate is armed with two rows of teeth. They feed chiefly on insects. Britain produces only two well-ascertained species; the SAND L. (*L. agilis* or *L. stirpium*), about seven inches long, variable in colour and marking, but generally

LLANELLY, a parliamentary borough, manufacturing town, and seaport of South Wales, in the county of Carmarthen, and 16 miles south-east of the town of that name. The mineral wealth of the vicinity, and the easy access to the sea, have raised the town to considerable commercial importance. The Cambrian copper-works employ a great number of the inhabitants; but there are also silver, lead, iron, and tin works, and a pottery. Coal is largely exported. In 1862, 5745 vessels of 417,289 tons entered and cleared the port. Pop. (1861) of parliamentary borough, 11,446.

LLANGOLLEN, a small town of North Wales, in the county of Denbigh, picturesquely situated on the right bank of the river Dee, 22 miles south-west of Chester. It is visited by tourists on account of the beauty of the famous Vale of L., and for its antiquities, among which is the fragment of the round inscribed Pillar of Elisay.

LLANIDLOES, a municipal and parliamentary borough of North Wales, in the county of Montgomery, 19 miles west-south-west of the town of that name. Its church is one of the most beautiful in Wales. Considerable manufactures of flannel and other woollen fabrics are carried on. L. unites with several other boroughs in sending a member to parliament. Pop. (1861), 3127.

LLANOS are vast steppes or plains in the northern portion of South America, partly covered with tall luxuriant grass, and partly with drifting sand, and stocked with innumerable herds of cattle. They resemble the more southern Pampas (q. v.), and the North American Savannas (q. v.). The inhabitants, a vigorous race of shepherds, are called Llaneros.

LLORENTE, JUAN ANTONIO, a Spanish historian, was born at Rincon del Soto, near Calahorra, March 30, 1760. He was educated by his maternal uncle, and received orders in 1779. He took his degree in canon law, and was named successively advocate of the Council of Castile in 1781, vicar-general of Calahorra (1782), and finally secretary of the Inquisition in 1789. L. was from an early period attached to the liberal party. On the fall of Jovellanos, he was deprived of his employments, and remained in disgrace till 1805, when he recovered favour as the reward of a literary service of a very questionable character which he rendered to Godoy, by a historical essay against the liberties of the Basque Provinces. On the intrusion of the Napoleon dynasty, L. became a zealous partizan of the French, and an active instrument of the French policy, to which he lent all his support at the press, as well as in office; and being obliged to fly, on the restoration of Ferdinand, he fixed his residence in Paris, where he published the work to which his celebrity is chiefly due—his *Critical History of the Inquisition*. This work, which professes to be founded on authentic documents, although throwing much light on a subject previously inaccessible, has, in the judgment of impartial historians, as Prescott, Ranke, and others, lost most of its value by its plainly partizan character, and by the exaggerations in which it abounds. See INQUISITION. Written by L. in Spanish, it was translated into French, under the author's eye, by Alexis Peillier (Par. 1817–1818), and has been translated into most of the European languages. L. published, during his residence in Paris, several other works, some literary, as his *Critical Observations on Olé Bias*; some polemical, as his *Portraits Politiques des Papes*; and others, it is alleged, of a more questionable character in a moral point of view. His work on the popes led to his being compelled to quit Paris

1, Viviparous Lizard; 2, Sand Lizard.

sandy-brown on the upper parts, blotched with darker brown, and having a lateral series of black, rounded spots, each of which has a yellowish-white dot or line in the centre; and the COMMON L. or VIVIPAROUS L. (*Zootoca vivipara*), smaller, more slender, very variable in colour, a dark-brown generally prevailing on the upper parts. The former species is comparatively rare; it inhabits sandy heaths: the latter is abundant in dry moors and sand-hills. They differ remarkably in the former being oviparous, the latter, viviparous, or, more strictly speaking, ovoviviparous. Both are harmless creatures, as are all the rest of this family. Larger species are found in the more southern parts of Europe. Some of the lizards are quite susceptible of being tamed. They are remarkable for the readiness with which the end of the tail breaks off; the flinging of a glove or handkerchief on one when it is trying to make its escape, is often enough to cause the separation of this portion, which lies wriggling, whilst the animal hastens away. The lost portion is afterwards reproduced. Lizards become torpid in winter.

LIZARD, in Heraldry, means either—1. The reptile usually so called; or, 2. A beast somewhat resembling the wild-cat, and said to be found in several countries of Northern Europe, represented with brown fur, and large spots of a darker shade.

LIZARD POINT. See CORNWALL.

LLAMA. See LAMA.

LLANDA'FF (*Llan Taff*), the place of a church on the Taff, a city of South Wales, in the county of Glamorgan, is situated on the right bank of the Taff, 3 miles above Cardiff, in a district remarkable for its beauty. It is the seat of a bishopric, the revenue of which is £4200. Pop. about 700.

LLANDUDNO, a watering-place of rising importance in the county of Caernarvon, North Wales, is situated between the Great and Little Orme's Heads, 40 miles west-south-west of Liverpool. The air is described as 'delicious,' and there is every facility for sea-bathing. Pop. (1861) of parish, 2316.

in 1822, and a few days after he reached Madrid he died, February 5, 1823. He was also the author of *Memoirs of the Spanish Revolution*, 3 vols. 8vo, 1819, and an *Essay on a Religious Constitution*, 1819. Most of his works were published both in Spanish and in French.

LYOYD'S, a set of rooms on the first floor of the Royal Exchange, London, frequented by merchants, ship-owners, underwriters, &c., for the purpose of obtaining shipping intelligence, and transacting marine insurances. One large room, with small rooms attached to it, is set apart for the use of the *underwriters*, and there two enormous ledgers lie constantly open, the one containing a list of vessels *arrived*, the other recording disasters at sea. In the same series of rooms there is a self-registering anemometer and anemoscope for the use of the underwriters; also a valuable collection of charts for consultation. See **INSURANCE, MARINE**. The extent of business transacted here may be imagined when we consider that the amount annually insured amounts to about £40,000,000. None but members of L. who have duly paid the fees, are allowed to transact business there either as insurance-brokers or underwriters. The shipping intelligence is furnished by agents appointed for the purpose, and there is scarcely a port of consequence where one is not stationed. The agent receives no salary, his labour being amply compensated by the advantages he derives from the connection. The intelligence contained in the ledgers is also diffused over the country every afternoon by the publication of *Lloyd's List*. There are two other rooms—the *Reading Room*, which is merely an extensive news-room; and the *Captains' Room*, where auctions of ships are carried on, and where captains and merchants can meet together in a sociable manner. The society of L. is managed by a committee of twelve, selected from among the members, who also appoint the agents and officials of the establishment. The expenses are defrayed by fees and annual subscriptions.

Lloyd's Register of British and Foreign Shipping is a volume published annually, and containing information respecting vessels, their age, materials, repairs, owners, captains, &c. This information is supplied by salaried agents at the different ports. The office of the *Register* is quite distinct from L. of the Exchange.

The name *Lloyd's*, which is now generically applied, arose from the circumstance that the headquarters of the London underwriters was originally Lloyd's coffee-house.

LYOYD'S, AUSTRIAN, an association for general, commercial, and industrial purposes, was founded in Trieste by Baron Bruck in 1833, to supply the want experienced by the maritime insurance companies of that port, of a central administration to attend to their common interests. This association, like its London prototype, has agents in all the principal foreign ports, whose duty it is to collect all information of a nature to affect the commerce and navigation of Trieste, and to keep a list of all entrances and clearances of ships at their respective ports. This information is published in the *Giornale del Lloyd Austriaco*. This company has established regular communication between Trieste and all the important seaports in the Adriatic and Levant, by means of a large fleet of steamers, which also carry the Austrian mails. The society of A. L. includes three sections: the first is composed of insurance companies, the second of steam-boat companies, while the third or scientific department (established in 1849), has a printing-press, an engraving-room, and an artistic

establishment for the perfecting of engraving on copper and steel. This last section has issued a great number of journals and periodicals of a literary and scientific description.

LOACH (*Cobitis*), a genus of fishes of the family *Cyprinidae*, having an elongated body, covered with small scales, and invested with a thick mucous secretion; a small head, a small toothless mouth surrounded with 4–10 barbules; small gill-openings, and three branchiostegous rays. One species, the **COMMON L.** (*C. barbatula*), called in Scotland the *Beardie*, is common in rivers and brooks in Britain. It seldom exceeds four inches in length: is yellowish-white, clouded, and spotted with brown; feeds on worms and aquatic insects; and is highly esteemed for the table. It generally keeps very close to the bottom of the water.—The **LAKE L.** (*C. fossilis*) of the continent of Europe, is sometimes a foot long, with longitudinal stripes of brown and yellow. It inhabits the mud of stagnant waters, coming to the surface only in stormy weather. The flesh is soft and has a muddy flavour.

LOADSTONE, or **MAGNETIC IRON ORE**, a mineral consisting of a mixture of peroxide of iron and protoxide of iron; sometimes occurring in grains, as *Iron Sand*, in trap rocks, sometimes in beds in primitive rocks, as in Scandinavia, where it is a valuable ore of iron. It is remarkable for its highly magnetic quality; and indeed magnetism was first known as belonging to it. It is of a black colour; and occurs in concretions, and crystallised in octahedrons and rhomboidal dodecahedrons.

LOAM (Ger. *Lehm*, allied to Lat. *limus*, mud, and to *lime*, *slime*), a term much employed by agriculturists and others, to designate a soil consisting of a mixture of clay, sand, and lime, with animal and vegetable matters in a state of intimate mixture. The clay varies from 20 to 50 per cent.; the proportion of lime is generally not more than 5 per cent. Loamy soils are among the best and most fertile of soils. They are not stiff and tenacious like clay soils, and they are much more fertile than sandy soils. Even in mere *mechanical* properties, they are superior to both. The 'clay' used for making bricks is often really a loam in which the proportion of true clay is large. In Italy, France, and other countries, walls are made of L. beaten down between planks placed at the requisite width: and these walls become very solid, and last for centuries.

LOAN OF MONEY is an implied contract, by which B, the borrower, agrees to repay L, the lender. There are various modes by which B gives an acknowledgment for a loan, as by giving a bond or a promissory-note, or L. O. U. (q. v.), the last of which requires no stamp. But no writing is necessary to constitute the contract, which may be proved by parol, and often is proved by the lender's oath, confirmed by circumstantial evidence or letters of the borrower. The debt must in general be sued for in six years in England and Ireland. In Scotland, a borrower is much more favoured, for there are only two ways of proving the loan if it exceeds £8, 6s. 8d., viz. by some writing of the borrower, or by stating the truth as to whether the money is really due on the borrower's oath. Hence, if a hundred witnesses saw the loan advanced, but there was no writing: or the borrower, when put to it, denied it on oath, he can escape liability entirely.

LOA'NGO, a maritime kingdom of South-West Africa, extends on the coast from Cape Lopez, in lat. 0° 44' S., to the river Congo or Zaire, which separates it on the south from the country of Congo.

Forests cover a great portion of the country, which is mountainous towards the south-east. On the coast the surface is level and fertile; the interior is not yet well known. Formerly, the chief trade was in slaves; ivory and wax now form the chief exports. The inhabitants are skilful in the manufacture of baskets, variously-dyed mats, grass-cloth, wooden spoons, figures, &c. At the town of Kabinda, near the north bank of the Congo (pop. from 10,000 to 18,000), boats and canoes, the former almost equal to those of English make, are built. Trade is free to all nations. The king is considered a divinity, and the government is an absolute despotism. Polygamy prevails, and a man's wives are, at his death, handed down by inheritance, like the rest of his goods. The religion is an idolatrous superstition. Loango, the chief town, is situated 130 miles north of the mouth of the Congo River, near the coast. The pop., including the villages in the vicinity, amounts to about 20,000.

LOASACEÆ, a natural order of exogenous plants, natives of America, and chiefly from the temperate and warmer parts of it. There are about seventy known species, herbaceous plants, hispid with stinging hairs. They have opposite or alternate leaves, without stipules, and axillary 1-flowered peduncles. The calyx is 4–5-parted; the petals 5, or, by an additional inner row, 10; often hooded. The stamens are numerous, in several rows, sometimes in bundles. The ovary is inferior, 1-celled; the fruit capsular or succulent.—Some of the species are frequently to be seen in hothouses and flower-gardens. The genus *Loasa* sometimes receives the popular name of CHILI NETTLE.

LOBELIA, a genus of exogenous plants of the natural order *Lobeliaceæ*. This order is nearly allied to *Campulidaceæ*, one of the most conspicuous differences being the irregular corolla. It contains almost 400 known species, natives of tropical and temperate climates, abounding chiefly in damp woods in America and the north of India. They are

samensis, is establa.—The genus *Lobelia* is the only one of this order of which any species are British. The WATER L. (*L. Dortmanna*) is frequent in lakes with gravelly bottom, often forming a green carpet underneath the water with its densely matted, sub-cylindrical leaves. The flowers are blue, the flowering stems rising above the water.—To this genus belong many favourite garden-flowers, as the beautiful CARDINAL FLOWERS (*L. cardinalis*, *L. fulgens*, and *L. splendens*) and the BLUE CARDINAL (*L. syphilitica*), natives of the warmer parts of North America, perennials, which it is usual to protect during winter in Britain. To this genus belongs also the INDIAN TOBACCO of North America (*L. inflata*), an annual, with an erect stem, a foot high or more, with blue flowers, which has been used as a medicine from time immemorial by the aborigines of North America, and was introduced into this country, in 1829, by Dr Becca. Both the flowering-herb and the seeds are imported. It is the former, compressed in oblong cakes, which is chiefly employed. The chemical constituents of *L.* are not accurately known. A liquid alkaloid, *Lobeline*, and a peculiar acid, to which the term *Lobelic acid* has been applied, have been obtained from it.

In small doses, it acts as diaphoretic and expectorant; in full doses (as a scruple of the powdered herb), it acts as a powerful nauseating emetic; while in excessive doses, or in full doses, too often repeated, it is a powerful acro-narcotic poison. It is the favourite remedy of a special class of empirics, and consequently deaths from its administration are by no means rare. Physicians seldom prescribe it now, except in cases of asthma.

In a case of poisoning by this drug, the contents of the stomach should be withdrawn as speedily as possible. If the stomach-pump is not at hand, an emetic of sulphate of zinc or of mustard should be administered.

LOBIPEDIDÆ, a family of birds of the order *Grallæ*, nearly allied to *Rallidæ* (Rails, Crakes, Gallinules, &c.), but differing in having the toes separately margined on both sides with a scolloped membrane, thus forming an interesting connecting link with the web-footed birds, or order *Palmipedes*. The general appearance of many of the *L.* also approaches to that of the *Anatidæ*. Coots and phalaropes are examples of this family. They are all aquatic, some of them frequenting fresh, and others salt water; some often found far out at sea on banks of sea-weed.

LOBLOLLY-BOY, the name applied on board ship to the man who assists the medical officers in the 'suck-bay,' or hospital.

LOBSTER (*Homarus*), a genus of Crustaceans, of the order *Decapoda*, sub-order *Macroura* (see CRAYFISH), differing from Crayfish (*Astacus*), to which, in general form and characters, they are very similar, in having the rostrum in front of the carapace not depressed, but straight, and armed with many teeth on each side, and the last ring of the thorax not movable, but soldered to the preceding one. The COMMON *L.* (*H. vulgaris*), found in great plenty on rocky coasts of Britain and most parts of Europe, is too well known to require description. It sometimes attains such a size as to weigh twelve or fourteen pounds, when loaded with spawn, although a lobster of one pound weight, or even less, is deemed very fit for the market. It is needless to say how highly the *L.* is esteemed for the table. It is in best season from October to the beginning of May. Its beautifully clouded and varied bluish-black colour changes to a nearly uniform red in boiling. It is found in greatest abundance in clear water of no great depth, and displays great activity in retreating from danger, using its powerful tail-fin for

Indian Tobacco (*Lobelia inflata*).

generally herbaceous or half-shrubby, and have a milky juice, which is often very acrid, and often contains much emeticon. A poisonous character belongs to the order, and some are excessively acrid, as *Tupa Fuidi*, a Chilean and Peruvian plant, of which the very small excites vomiting; yet the succulent fruit of one species, *Centropogon Suri-*

swimming, or almost springing through the water, and thrusting itself into holes of the rocks which seem almost too small to admit its body. The claws are powerful weapons of defence; one is always larger than the other, and the pincers of one claw are knobbed on the inner edge, those of the other are serrated. It is more dangerous to be seized by the serrated than by the knobbed claw. Lobsters are sometimes caught by the hand, which requires dexterity; but they are more frequently taken in traps of various kinds, sometimes made of osier twigs, sometimes a kind of nets, sometimes pots, but always baited with animal garbage. Vast quantities of lobsters are sent to market, chiefly to London, from the coasts of all parts of Britain, including the utmost Shetland Isles and Hebrides. Lobsters are very voracious; they are also very pugnacious, and have frequent combats among themselves, in which limbs are often lost; but the loss is soon repaired by the growth of a new limb, rather smaller than the old one. Like crabs, they frequently change their shelly covering, and, for a short time before their moulting, are very languid and inert. Their growth takes place during the time when the shell is soft, and with extraordinary rapidity.—The AMERICAN L. (*H. Americanus*) has claws much larger in proportion than the common lobster.—The NORWAY L. (*Nephrops Norvegicus*) is frequently taken on the British coasts, and appears in the markets.

Norway Lobster (*Nephrops Norvegicus*).

The eyes are kidney-shaped, and not round, as in the common lobster. The claws have also a more slender and prismatic form, and the colour is a pale flesh colour. It is said by some to be the most delicate of all the crustaceans; by others, to be inferior to the common lobster.—The SPINY L., or SEA-CRAWFISH (*Palinurus vulgaris*), is not uncommon on the rocky coasts of Britain, particularly in the south. It is believed to be the *Karabos* of the Greeks, and the *Locusta* of the Romans. It attains a length of about eighteen inches. The shell is very hard, and the whole body is rough with short spines. The antennae are very long, much longer than those of the common lobster. There are no claws or pincers, the first pair of feet being very similar to the others. The Spiny L. is brought to market in London and elsewhere, but is inferior to the common lobster.—Other species of these genera are found in other parts of the world.

LOCHABER AXE, an axe with a curved handle, and very broad blade. It was the ancient weapon of the Highlanders, and was carried by the old City Guard of Edinburgh.

LOCHES, a picturesque town of France, in the department of Indre-et-Loire, on the left bank of the Indre, 26 miles south-east of Tours. Pop. 5191. The castle of L. (now a ruin) acquired a fearful reputation during the reign of Louis XI., as the scene of those deeds of cruelty which were so horrible that they had to be done in utter darkness and secrecy. At a later period, James V. of Scotland was married in this castle to Magdalen of France; and still later, Francis I. received here, in splendid state, the Emperor Charles V., on his way from Spain to Ghent.

LOCK of a gun is that apparatus by which the powder is fired. Muskets, in their earliest use, were fired by the hand applying a slow match to the touch-hole. Towards the end of the 14th c. the first improvement appeared in the matchlock.

Matchlock.

This consisted of a crooked iron lever, *a*, in the end of which the match was fixed. By a pin-gear of a simple nature, pressure on the trigger, *b*, brought the match accurately down on the powder-pan, of which the lid, *c*, had previously been thrown forward by the hand. This mode of firing involved the carrying of several yards of slow match, usually wound round the body and the piece; rain extinguished the match, and wind dispersed the powder in the pan, so that the matchlock, clumsy withal, was but an uncertain apparatus.

Superior to the matchlock was the wheel-lock, introduced at Nurnberg in 1517, in which fire was produced by friction between a piece of flint or iron pyrites and a toothed wheel. The mechanism which generated the sparks simultaneously uncovered the pan, so that the dangers from wind and rain were averted; but before firing, the apparatus required to be wound-up like a clock, and therefore the discharges could not be frequent. The wheel-lock continued for a long period to be used in Germany, and partially in France. In the Spanish dominions, however, its place was supplied by the simpler contrivance called the Snaphaunce, Snapphahn, or Anaphan lock, of nearly contemporaneous invention, which acted by means of a spring outside the lock-plate, produced fire through the concussion of a flint against the ribbed top of the powder-pan. Its positions of half and full cock were obtained by the insertion of a pin to stay the operation of the main-spring. In the middle of the 17th c., the flint-lock was invented, combining the action of the wheel-lock and the snaphaunce, while it was incontestably superior to either. After combating much prejudice, it was universally adopted in the armies of Western Europe by the commencement of the 18th century. Muskets embracing it obtained the name of 'fusils,' a French adaptation of the Italian word *foceile*, a flint. With successive improvements, the flint-lock continued in general use until the introduction of the percussion-lock almost in our own day; and among eastern and barbaric nations, the flint-lock is still in common demand. Its great superiority over the snaphaunce consisted in the 'tumbler' (of which

LOCK.

presently) and the 'scaer,' appliances still retained in the percussion-lock, which enabled the positions of half and full cock to be taken up without the intervention of pins, always uncertain in their action.

The principle of the percussion-lock is the production of fire by the falling of a hammer upon detonating powder, the explosion of which penetrates to the charge in the barrel of the gun. The first practical application of this principle to firearms is due to the Rev. Mr Forsyth of Belhelvie, in Aberdeenshire. Various forms in which to ignite the detonating powder have been devised, but that now generally accepted is the copper cap, fitting tightly on the nipple of the gun, charged with a detonating compound, and exploded by the hammer falling upon it. The percussion-lock, with the latest improvements, is shown in the annexed figure. A is the lock-plate; B, the main-spring, communicating, through the swivel C, with the

Percussion-lock.

tumbler D, which concentrically with the hammer E, moves on the tumbler-nail F. In the figure, the hammer has delivered its stroke, and its further progress in the direction required by the spring B, is barred by the nipple M. On pulling back the hammer, E, to the position of half-cock N, the tumbler turns with it, and the pointed end of the scar I (which moves on the scar-nail L as centre), influenced by the scar-spring K, falls into the notch G, in the tumbler. This notch has such a depth that no action of the trigger can release the tumbler from the stoppage caused by the scar. On forcing back the hammer to full-cock O, however, the scar will move down to the shallower notch H; and on the lever end of the scar being raised by the trigger until the pointed end clears the tumbler, the latter, acted on by the main-spring, flies round to the position delineated, and brings down the hammer with a heavy blow on the cap. To keep the works of the lock firmly in their several places, a metal shield, called the 'bridle,' is screwed over them by the screws at L and P, and includes the pin, F, in its width. The percussion-lock was generally adopted in the British army about the year 1840; it is now frequently applied to cannon as well as small-arms.

LOCK, on a river or canal, is an arrangement of two parallel floodgates, by which communication is secured between two reaches of different levels. When locks were first introduced, is not known within a hundred years, nor is it clear whether Holland or Italy can claim the distinction of having first employed them. This much, however, can be affirmed with certainty, that at the beginning of the 17th c., locks existed in both countries, and it is probable that they were arrived at gradually by successive improvements in the mode of rendering shallow rivers navigable. Obviously, the first

step would have been to dam the stream across at intervals, leaving gates in the dams for the passage of vessels. This measure would have divided the river into reaches or steps, each, as the source was approached, being higher above the sea than the one last passed. But the passage up or down—and especially up—such a stream must be extremely slow, as at each dam a vessel must wait until the gate has been opened, and the level equalised in the reach it is in, and that on which it is proposed to enter. Where the reaches were far apart, a large body of water would require to be raised or lowered, and the process could not but be tedious. The medieval engineers next tried to place the dams as near together as possible, but expense limited this. The course then was to build two dams, with floodgates, just far enough apart to allow a vessel to float within. Under this arrangement, only the section between the dams had to be raised or lowered. The cost of thus doubly damming a wide river, however, was very great, and it was an easy transition of idea to remove the passage from the main stream altogether, and construct a lock with double gates, which should open at one end above, and at the other below the dam or weir. The economy of money in building, and of time and water in working, was obvious; and on

Canal-lock—seen from above.

this principle all locks are now made, wherever there is traffic of any importance. The arrangement consists of two pairs of gates, opening up the stream, and offering, when shut, a salient angle to the stream or upper pressure. The effect is that the weight above only tends to close the gates still tighter. When a vessel is to be brought from one level to the other, it is floated into the 'pound,' as the space between the upper and lower gates is called. The gates are then shut, and a sluice in the lower part of the upper gate raises the surface of the pound, or the sluice in the lower gate depresses it, in a few minutes to the level of the upper or

Vertical Section of a Thames Lock.

lower reach, as the case may be. These sluices are worked by racks in the gates, and the ponderous gates themselves are moved with the aid of long and heavy levers. Of course, one pair of gates must always be shut, or the two reaches would speedily assimilate their levels. In the engraving, the boat has just entered from the lower part of the river.

On canals where water is scarce, a reservoir, equal in size to the lock, is formed at its side. When the pound is to be emptied, the water is run into the reservoir until it and the lock are at the same level, which will be half height. The

reservoir is then closed, and the remaining water in the lock run off through the lower sluices in the usual way. On refilling the lock, before opening the upper sluices, one quarter the quantity required can be obtained from the reservoir, thus effecting a saving of many tons of water at each filling.

On rivers, advantage is taken of islands for the formation of Weirs (q.v.) and locks. On the Thames, the locks are from two to three miles apart, and the river is locked by upwards of 50 locks from Teddington to Lechlade. On canals, to economise superintendence, the locks are usually constructed in 'ladders' of several close together, like a flight of steps. As the pressure on lock-gates is very great, and varies with the height of water above, the rise in one lock is rarely more than 8 or 9 feet, although in some instances 12 feet have been accomplished, and in a very few cases even more.

LOOK, a contrivance for securely fastening the door of a building, the lid of a box, &c. Amongst the early Egyptians, Greeks, and Romans, locks were used, but their construction evinced little skill, and they were usually made of hard-wood; in fact, they were little more than wooden bolts, requiring only the hand to unfasten them. The first advance upon this was a remarkable one, invented by the ancient Egyptians; it contained

Fig. 1.

the principles of the modern tumbler-lock; but although still in use amongst the modern Egyptians and Turks, it has never, in their hands, made any advance. This lock consists of a case, fig. 1, A, which is nailed to the door; through the case

passes a large wooden bolt, fig. 1, B, the end of which, E, enters the staple, whilst the opposite end is left exposed. In the lower part of the bolt B, is a square groove C, which has certain round or square holes, as seen in

fig. 2, f, which gives the open view of the lock. When the bolt is pushed home into the staple, these holes come exactly under corresponding little cavities in the case

Fig. 2.

c, fig. 2, in each of which is placed an upright wooden pin, with a knob, which prevents its falling too low: these little pins consequently fall into the holes in the bolt when it is pushed far enough, and the door is locked. In order to unlock it, the bar of wood,

Fig. 3.

fig. 3, is passed into the groove C, in the bolt, and on the bar there are the same number of pins of wood placed upright as there are holes in the bolt, and loose pins in the chambers of the case; and these upright pins are placed so as to correspond exactly in size and position to the holes; therefore, when the pins reach the holes, they slip into them, and push up the loose pins into their respective cavities, and the bolt is then easily pulled back by means of the bar or key. This is simple and ingenious, but it is very clumsy, and, as usually made in Turkey, is

not secure. Nevertheless, it has been in use longer than any other form of lock in existence.

During the middle ages, very complicated and ingenious locks of various kinds were made, and as much artistic taste was expended upon the ornamentation of their external metal-work as there was skill in the interior mechanism. Such locks, however, were not adapted to general use, and they were only found on the castles of the wealthy. The ordinary ward and spring lock, were the only ones commonly employed up to the beginning of the present century, even for important purposes, and this kind of lock is still in very common use. It consists of a bolt of metal, which a spring is attached, and it is moved back ward or forward by means of a key, which, by raising the bolt, compresses the spring in the slot through which it works, and so lets it pass on until out of the range of the key's action, which, turning on a pivot, is regulated by the length of its work, and the depth of a curve cut in the under side of the bolt. In order to prevent any key of the same size opening all such locks, little ridges of iron are placed in circles or parts of circles, and wards are cut in the keys, so as to correspond with them; hence, only the key which has openings or wards which will allow the ridges to pass through them, can be used. This will be better seen by the sketch, fig. 4. A, is the bolt, having at the end

Fig. 4.

opposite to that which enters the staple a small piece slit, bent outwards, and tempered hard; this forms the spring a; below, are two notches b, divided by a curved piece of the bolt c; there is another notch d, which, if the key enters, and is turned round, it draws the bolt forward or backward in locking or unlocking, and the spring makes the end of the bolt either drop into one of the notches b, b, or rise up the curve c, according to the distance to which it is pulled. The ridges B, B are so placed as to allow the wards of the key, C, to move freely, and to prevent the entrance of another key of different arrangement.

The tumbler-lock is the type of another class, and is an advance upon the last; the two principles are, however, in most cases combined. The principle of the tumbler-lock will be readily seen by reference

Fig. 5.

to fig. 5. In this, a lock nearly alike the former has been chosen, and the simplest form of tumbler added. It will be seen that the bolt, A, has neither

the spring-piece nor the notches and curves on the under side, as in fig. 4; but it has two notches on the upper side, which are exactly as far apart as the distance moved by the bolt in locking or unlocking. Behind the bolt, partly seen only—the covered parts being indicated by dotted lines—is the tumbler B, a small plate moving on the pivot d, and having projecting from its face a small square pin e, which, when the bolt is locked or unlocked, falls exactly into one or the other of the small notches f, f. It will also be seen that there is in the key a notch g, which corresponds to the outline of the tumbler, as indicated by the dotted lines. This acts upon the tumbler when the key is turned, and raises it so as to lift the pin out of the notch in the bolt, and allow the latter to be moved freely forward until the other notch comes under the pin, when the latter falls into and immediately stops its further progress, and the action of the key must be reversed in order to relieve it again. This very simple application of the tumbler is sufficient to explain the principle which may be, and is varied to an almost endless extent. Chubb's justly celebrated lock carries it out most fully, the bolt itself being only a series of tumblers, with a notch on the key for each. Bramah's lock, patented in 1788, has enjoyed immense reputation, chiefly for cabinets, desks, and other similar applications; it is very different in principle from those before mentioned, consisting of a number of movable slides or interior bolts working in an internal cylinder of the lock, and regulated by the pressure upward or downward of the key acting on a spiral spring. For ordinary purposes, it is very secure; but when the most perfect security is required, the beautiful lock invented by Mr Cotterill of Birmingham, and the still more ingenious one of Mr Hobbs of America, must be preferred. These beautiful and complicated pieces of mechanism cannot be described within the limits of this article; but ample information upon them and others can be found in Mr Denison's *Treatise on Locks*, and in *The Rudimentary Treatise on the Construction of Locks*, by Charles Tomlinson.

LOCK, or GOWPEN, in Scotch Law, is the perquisite paid by custom to the miller's man for grinding corn. See THIRLAGE.

LOCK-UP HOUSES, the name given to the houses of bailiffs of the sheriff, to which debtors arrested for debt are first taken, until it is seen whether they will settle their debt without being taken to the ordinary jail. See EXECUTION; IMPRISONMENT.

LOCKE, JOHN, was born at Wrington, near Bristol, on the 29th of August 1632. His father was steward to Colonel Popham, and served under him as captain in the Parliamentary army during the Civil War. L. was sent for his education to Westminster School, where he continued till 1651, when he was elected a student of Christ-Church, Oxford. There he went through the usual studies, but seemed to prefer Bacon and Descartes to Aristotle. His tendency was towards experimental philosophy, and he chose medicine for his profession. In 1664, he went to Berlin, as secretary to the British envoy, but soon returned to his studies at Oxford. In 1666, he made the acquaintance of Lord Ashley, afterwards Earl of Shaftesbury, and on his invitation went to live at his house. In 1672, when Shaftesbury became Lord Chancellor, L. was appointed Secretary of Presentations, a post which he afterwards exchanged for that of Secretary to the Board of Trade. He was employed to draw up a constitution for the American province of Carolina, but his articles on religion were deemed too liberal, and

the clergy got a clause inserted, giving the favour of the state exclusively to the established church. In 1675, he took up his residence at Montpellier for the benefit of his health. He had all his life an asthmatic tendency, which at that time threatened to pass into consumption. At Montpellier, he formed the acquaintance of the Earl of Pembroke, to whom his *Essay* is dedicated. In 1679, he rejoined the Earl of Shaftesbury in England; but in 1682 the earl fled to Holland, to avoid a prosecution for high treason. L. bore him company, and so far shared with him the hostility of the government of James, as to have his name erased, by royal mandate, from the list of students of Christ-Church. Even in Holland, he was demanded of the States-general by the English envoy; but he contrived to conceal himself till the English court ceased to trouble itself on his account. In 1687, his *Essay on the Understanding*, begun seventeen years before, was finished; and an abridgment of it was published in French (1688), by his friend Le Clerc, in his *Bibliothèque*, in which L. had published two years before his *Method of a Commonplace Book*. In 1689 appeared (also in Holland) his first letter on *Toleration*. But in 1688, the year of the Revolution, he came back to England in the fleet that conveyed the Princess of Orange. He soon obtained from the new government the situation of Commissioner of Appeals, worth £200 a year. He took a lively interest in the cause of toleration, and in maintaining the principles of the Revolution. In 1690, his *Essay on the Understanding* was published, and met with a rapid and extensive celebrity; and also a second letter on *Toleration*, and his well-known *Treatises on Government*. In 1691, he was engaged upon the momentous question of the restoration of the coinage, and published various tracts on the subject. In 1692, he brought out a third letter on *Toleration*, which, as well as the second, was a reply to the attacks made on the first. In 1693 was published his work on *Education*. In 1695, King William appointed him a Commissioner of Trade and Plantations. In the same year he published his treatise on *The Reasonableness of Christianity*, which was written to promote William's favourite scheme of a comprehension of all the Christian sects in one national church. He maintained a controversy in defence of this book; he had another controversy in defence of the *Essay on the Understanding*, against Stillingfleet, the Bishop of Worcester. His feeble health now compelled him to resign his office of Commissioner of Plantations, and to quit London; and he spent the remainder of his life at Oates, in Essex, at the seat of Sir Francis Masham. His last years were very much occupied with the study of the Scriptures, on which he wrote several dissertations, which, with his little work, entitled *On the Conduct of the Understanding*, were published after his death. He died 28th October 1704.

Great as were L.'s services to his country, and to the cause of civil and religious liberty, his fame rests on the *Essay on the Understanding*, which marks an epoch in the history of philosophy. His purpose was to inquire into the powers of the human understanding, with a view to find out what things it was fitted to grapple with, and where it must fail, so as to make the mind of man 'more cautious in meddling with things exceeding its comprehension, and disposed to stop when it is at the utmost extent of its tether.' This purpose led him to that thorough investigation of the constitution of the human mind, resulting in the most numerous and important contributions ever made by one man to our knowledge on this subject. He institutes a preliminary inquiry, in the subject of

the First Book, as to the existence of innate ideas, theoretical and practical, on which the philosophical world has been so much divided. See COMMON SENSE. L. argues against the existence of these supposed innate conceptions, or intuitions, of the mind with a force and cogency that appear irresistible. Having thus repudiated the instinctive sources of our knowledge or ideas, he is bound to shew how we come by them in the course of our experience. Our experience being twofold, external and internal, we have two classes of ideas—those of Sensation, and those of Reflection. He has therefore to trace all the recognised conceptions of the mind to one or other of these sources. Many of our notions are obviously derived from Experience, as colours, sounds, &c.; but some have been disputed, more especially such as Space, Time, Infinity, Power, Substance, Cause, mere Good and Evil; and L. discusses these at length, by way of tracing them to the same origin. This is the subject of Book Second, entitled 'Of Ideas.' Book Third is on language considered as an instrument of truth, and contains much valuable material. The Fourth Book is on the nature, limits, and reality of our knowledge, including the nature of demonstrative truth, the existence of a God, the provinces of faith and reason, and the nature of error.

LOCKED JAW. See TETANUS.

LOCKHART, JOHN GIBSON, was born at Cambsunethan, in Scotland, in 1794. His father was a minister of the Established Church of Scotland. L. received the first stages of his education at Glasgow, and afterwards proceeded to Oxford, where, in 1813, he took first-class honours. In 1816, he became an advocate at the Scotch bar. He appears, however, to have wanted the qualifications necessary for success in this profession, and besides, the bent of his mind was more toward literature than law. He and Wilson were long the chief supporters of *Blackwood's Magazine*. Here he began to exhibit that sharp and bitter wit that was his most salient characteristic, and made him the terror of his enemies. It was this connection which led to his acquaintance with Sir Walter Scott. In 1819, appeared *Peter's Letters to his Kingfolk*. In 1820, he married Miss Scott, eldest daughter of Sir Walter. In 1821, he published *Valerius*, and in 1822, *Adam Blair*. Both of these works, especially the latter, shew him to have possessed, at least, a thorough acquaintance with the rules of art in fiction-writing. In 1823 appeared his *Reginald Dalton*, a tale of English university life, and in 1824 his *Ancient Spanish Ballads*—perhaps the most popular of all his writings. In the same year he published his last novel, *History of Mathew Wald*. From 1826 to 1853, he edited the *Quarterly Review*. From 1837 to 1839, appeared his *Life of Scott*, a work of undoubted merit, but which has given rise to much bitter controversy. In 1837, his wife died, having been predeceased by their eldest son Hugh. His second son died at a later period. In 1843, L. was appointed Auditor of the Duchy of Cornwall, with a salary of £600 a year. In 1847, his only remaining child, a daughter, the sole surviving descendant of Sir Walter Scott, married J. R. Hope, Esq. She succeeded to the estate of Abbotsford on the death of her father, 25th November 1854.

LO'OKPORT, a village of New York, U. S., on the Erie Canal, and the Rochester and Niagara Falls Railway, 55 miles west of Rochester. The canal here falls 60 feet, with 5 combined double-locks, and its surplus water gives power to 5 flouring-mills, 7 saw-mills, 5 stove and shingle factories, machine-shops, and foundries. There are

13 churches, 4 banks, 2 daily and 3 weekly newspapers, and tanneries, manufactories of agricultural implements, glass, &c. Pop. in 1860, 13,623.

LO'OLE, a frontier town of Switzerland, canton of Neuchâtel, and 10 miles north-west of the town of that name. Pop. 8514, who are engaged chiefly in watch-making. In 1851, no less than 83,684 watches were manufactured.

LOCO, in Music, indicates that the notes are to be played exactly as they are written.

LOCUS, in Geometry, denotes the line or surface traversed by a point which is constrained to move in accordance with certain determinate conditions. Thus, the locus of a point which must always preserve the same uniform distance from a fixed point is the surface of a sphere; but if the motion be at the same time confined to a plane, the locus in this case will be a circle: this is an illustration of the division into *solid* and *plane* loci which prevailed among the ancients. The Greek geometers made their geometrical analysis depend much upon the investigation of loci, but no specific records of their progress in this branch of geometry now exist. What would appear to have been their method was restored by Dr Simson of Glasgow, whose work, *De Locis Planis* (1749), is a model of elegance. In modern Geometry, plane loci are treated under the name of CURVES (q. v.).

LOCUS DELICTI, the place where a crime was committed, is a phrase used in criminal law.

LOCUS PŒNITENTIÆ, the time to withdraw from a bargain—a phrase often used in Scotch law. The general rule is, that until the contract is finally settled, either party may retract; but if *rei interventus* has intervened, i. e., if some act has been done by the other party on the faith of the agreement, and by which his position has been altered, the *locus pœnitentiæ* is barred. Much depends on the circumstances of each case as to the application of the rule.

LOCUST (*Locusta* of some entomologists, and *Acrydium* of others), the type of a family (*Locustidae* or *Acrydidae*) of the order *Orthoptera*, and section *Saltatoria* (see GRYLUS). Locusts differ from grasshoppers and crickets in their short antennæ, and in the greater robustness of their bodies and limbs. The head is large, with two projecting oval compound eyes, and three stemmatic eyes on its summit. The wings, when folded, meet at an angle above the back; the abdomen is conical, and compressed. Their hind-legs are large, and they possess a great power of leaping. They make a strident noise by the friction of the rough hind-legs against the wing-covers. The wing-covers are leathery, narrower than the wings, but equal to them in length; the wings are large, reticulated, fold like a fan, and are often beautifully coloured—red, pink, brown, green, or blue. The power of flight of locusts has been the subject of much dispute, some asserting that they can fly to great distances, others that they have little power of flight, and are merely carried before a gale of wind. The truth seems to be between these extreme opinions: locusts fly well, but they are sometimes wafted by winds where their power of flight would never have carried them. Their food consists of the leaves and green stalks of plants; the mandibles and maxillæ are strong, sharp, and toothed, and in eating, they use their fore-feet to bring their food to their mouth. They generally quite consume any stalk of grass or other green thing which they have selected and cut. The terrible ravages of locusts are owing to the vast numbers in which they appear, filling the air like flakes of snow—

LOCUST TREE—LODGINGS.

darkening the sky, so that objects cast no shadow—seeming, in the distance, like a thick smoke—advancing with a sound like the rushing of chariots or of waters, or, in the words of the prophet Joel, 'like the noise of a flame of fire that devoureth the stubble'; whilst, as he also says, 'the land is as the garden of Eden before them, and behind them a desolate wilderness.' They eat up every green thing, and after the grass and leaves, they devour

Mediterranean, and its pods are the locust beans of our shops. See CAROB. A kind of effervescing beer, made from locust or carob pods, was last year sold in London.—The LOCUST TREE of America (*Robinia pseudacacia*), also called the FAIRER ACACIA, or THORN ACACIA, and on the continent of Europe and in Britain, very generally the ACACIA, is a valuable and extremely beautiful tree. See ROBINIA. The wood, known as *Locust Wood*, is useful for all

purposes in which great strength, and especially toughness, is required; this latter quality, which it possesses pre-eminently, makes it very valuable for trenails used in ship-building, and large quantities are imported for this purpose. It is also valuable for making the cogs of wheels.—The HONEY LOCUST (q. v.) TREE of America is a *Gleditsia*.—The LOCUST TREE of the West Indies is *Hymenaea courbaril*, a gigantic tree, whose pods also supply a nutritious matter, a mealy

Locust (*Locusta migratoria*).

in their hunger the bark of trees and shrubs. Ripe grain, however, may escape, as being too hard and dry. These multitudinous swarms of locusts do not appear annually; it is only after the lapse of a number of years that they are again so great and so destructive; and particular years are marked in the history of some countries as years of their extraordinary abundance, and of consequent famine and pestilence. When driven by a strong wind into the sea, they have sometimes been flung back on the beach in such quantities as to produce a stench intolerable to a great distance.

Locusts are found in almost all parts of the world except the coldest regions, but they abound chiefly in tropical and subtropical countries, and most of all, in Arabia and Africa. The eastern and southern parts of Europe are occasionally visited by their destructive hosts, and in the south of France, rewards are paid for the collection of locusts and of their eggs. The eggs are found cemented together in little masses in the ground. The insects themselves are taken by means of a stout cloth, the edge of which is made to sweep over the surface of the ground, and the locusts thus thrown together are quickly gathered into sacks. A similar mode of diminishing the nuisance is adopted in North America; but before an invasion such as districts of Asia and Africa are occasionally subjected to, all human effort fails.

Locusts are eaten in many countries, roasted, or fried in butter. They are also preserved in brine, or dried in the sun. They thus appear in the markets of Arabia, Syria, Egypt, Madagascar, &c., and are even exported as an article of commerce.

The most noted species is *Locusta migratoria* (or *Acridium migratorium*); about 2½ inches in length, greenish, with brown wing-covers, marked with black. It is this species which is most frequently seen in Europe. It is a rare visitant of Britain. Other species belong to other parts of the world. Some of them, forming the genus *Truxalis*, and inhabiting the warmest countries, are remarkable for their elongated conical head.

The little chirping 'grasshoppers' most common in Britain, differing from true grasshoppers in their short antennae, belong to the genus *Tetrix*, and family *Locustidae*.

LOCUST TREE, a name given in different parts of the world to different trees of the natural order Leguminosae.—The Carob Tree (*Ceratonia siliqua*) is often so called in the countries bordering on the

substance in which the pods are imbedded. It is sweet and pleasant, but apt to induce diarrhoea when recently gathered, which property, however, it loses when kept for a short time. A decoction of it, allowed to ferment, makes a kind of beer. The bark of the tree is anthelmintic; it yields a kind of resin called ANIME (q. v.), and it is valuable as a timber-tree, the timber (also known as *Locust Wood*) being close-grained and tough, and in request in England for trenails. It is very generally imported in the form of trenails.

LODE, a miner's term for Veins (q. v.) in which minerals occur. They are crevices, more or less vertical, produced by contraction, or the mechanical disturbance of the rock, which have subsequently been filled with metallic ore.

LODÈVE (ancient *Lutea* in *Gallia Narbonensis*), a town of Southern France, in the department of Hérault, situated on the Ergue, in a beautiful valley, 32 miles north-west of Montpellier. It is enclosed by walls, has a cathedral, and a pop. of 12,765, with manufactures of woollen cloth. L. is the birthplace of Cardinal Fleury.

LODGED, in Heraldry. A beast of chase, as a stag, is said to be lodged when lying down with its head erect; a beast of prey in the same position is said to be couchant.

LODGING-MONEY is an allowance, in the British army, granted to officers and others, for whom suitable quarters cannot be provided in barracks. Married sergeants and private soldiers who are married 'with permission,' are entitled to lodging-money at various rates up to 8s. a week, when separate rooms in barracks cannot be spared for the accommodation of each couple. The total charge for lodging-money in the army estimates of 1863—1864 amounts to about £100,000.

LODGINGS, or the use of part of another person's house, when occupied, constitute the relation of landlord and tenant between the parties. Lodgings being generally taken by the week, or month, or quarter, it is not necessary that the contract should be by writing, though it is expedient, especially where any particular stipulations are made. But where a furnished house is let, and a written agreement or lease is used, it is absolutely necessary that there should be a stamp on such writing, which must be cancelled by the parties under a penalty of £5 besides stamp-duty; and house-agents who let furnished houses above £25 for hire, must now take

out an annual licence, and pay duty. In England, the chief points of law which arise are as follow: One of the risks which the lodger runs is, that if his landlord, L, is himself a tenant to A, somebody else, then, if L's rent is in arrear, the lodger's goods may be taken by A to pay this, for the rule is, that all goods found on the premises, to whomsoever belonging, may be seized to pay arrears of rent, and it is immaterial whether the landlord A, who distrains, knows they are not L's, but the lodger's goods. The only remedy in such a case for the lodger is to deduct the amount of loss from the next rent he pays to L for lodgings. Hence, in order to learn whether the above risk is impending, a lodger frequently inquires beforehand at the landlord of the house, A, and the tax-collector, whether rent, &c., is in arrear. A lodging-house keeper, even where he keeps a boarding-house, which nearly resembles an inn, is not liable for the safe custody of the lodger's goods. He is merely liable for ordinary care; but he does not warrant at all hazards that the goods will not be stolen, as an Innkeeper (q. v.) does. Even if the lodger's goods are stolen by a servant of the house, the lodging-house keeper is not liable. The notice to quit depends on how the lodgings were taken. If they were taken by the week, a week's notice is sufficient; if by the month, a month's; and if by the quarter, a quarter's notice, unless some other agreement was made. Hence, if the lodger quit without notice, he is liable for one week's, or month's, &c. rent, even though the landlord put a notice in the window. The lodging-house keeper may distrain the lodger's goods for unpaid rent. When a lodger refuses to quit the lodgings after a notice has expired, he cannot be put out by force, but in many cases a summary remedy is given for recovering possession. In Scotland, the lodger's goods cannot be taken by the landlord of the lodging-house keeper for rent. A lodger, whatever rent he pays, yet not being rated to the poor, &c., is not entitled to vote for members of parliament; though it is said that in Scotland a different practice prevails in some places (Burton's *Law of Scotland*, 38). *Common lodging-houses*, where poor people lodge by the night, have recently been subjected to state interference; and by statutes 14 and 15 Vict. c. 28, and 16 and 17 Vict. c. 41, the keepers of such lodging-houses must register them. They are liable to be inspected by an officer of the Board of Health for sanitary purposes, and the keepers are bound, on notice, to report to the local authority every person who resorted to their houses during the preceding day or night. The keepers are bound to thoroughly cleanse all the rooms, stairs, &c., as often as by-laws shall direct, and to keep a proper supply of water. If fever break out, notice must be given to the local authority. These duties are enforced by means of penalties. These statutes were extended to Ireland by the statutes 23 and 24 Vict. c. 26.

LO'DI, chief town of the delegation of Lodi, in the province of Lombardy, stands on the right bank of the Adda, 19 miles south of Milan, on a gentle slope in the midst of a highly fertile district, and contains 20,000 inhabitants. It is protected by walls and a strong castle, erected by the Visconti, but lately appropriated as a military hospital. L. is a bishop's see and the seat of a college, and contains many fine buildings. Its chief manufactures are linens, silks, chemical products, and Majolica porcelain, for which it is famous. Its great trade is in cheese, especially the famous species known as Parmesan, which, instead of being manufactured at Parma, as one might infer from the name, is exclusively made in the vicinity of L., where 30,000 cows are kept for the purpose.

—LODI VECCHIO, or Old Lodi, is a ruined village

about five miles west of the modern town; it was founded by the Boii, and colonised by the father of Pompey the Great, hence its name, *Læus Pompeius*, which was gradually corrupted into the modern name of Lodi. L. is celebrated for the victory of the French under Bonaparte, over the Austrians, on 10th May 1796, when the long and narrow bridge was carried by the French columns, notwithstanding a tremendous fire from the Austrian batteries.

LO'ESS, a loamy deposit of Pleistocene age, occurring in the valleys of the Rhine and the Danube. It consists of a pulverulent loam of a yellowish-gray colour, made up principally of argillaceous matter, combined with a sixth part of carbonate of lime, and a sixth of quartzose micaceous sand. In the Rhine, it apparently once covered the whole valley and its tributaries, reaching to a considerable height up the bounding mountains. It has subsequently been greatly abraded, a fringe only of the deposit being left on the mountain-sides, and occasionally some outliers in the widest parts of the valley; the materials have been carried down by the river, and rearranged, as a newer loess or alluvium, in Belgium and Holland. This continuous deposit of fine sediment suggested the notion to the original observers of an enormous lake, whose barrier was at the narrow gorge of the Rhine at Bingen. But the loess occurs further down; besides, the contained fossils are not lacustrine, but those of land-animals (*Elephas* and *Rhinoceros*), and land-shells (*Helix*, *Pupa*, and *Succinea*). It is now believed to be the moraine mud of the Alpine glaciers, which was spread out gently in the valleys of the Rhine and Danube, as the land gradually emerged from the sea. The loess is generally from 30 to 50 feet in thickness, though sometimes as much as 200 feet. Fossils are not generally distributed in the strata, but they are sometimes locally abundant. They consist chiefly of land-shells of species now inhabiting the same region.

LOFO'DEN, LOFFO'DEN, or LOFOTEN, a chain of islands on the north-west coast of Norway, between lat. 67° and 69° 15' N., and stretching south-west and north-east for 175 miles. The largest of the islands are Hindöe, Andöe, and Langöe, Öst Vaagen, West Vaagen, and Flagstadöe. All of them are rugged and mountainous, indeed, some of the eminences in Vaagen attain an altitude of 4000 feet, and are covered with perpetual snow. The glens near the coast possess a temperature mild enough to allow of the cultivation of oats, barley, and potatoes. The permanent population is estimated at 4000. The islanders chiefly depend upon the fishery which was established some time previous to the 11th c., and has always attracted a large number of the inhabitants of the mainland. The average number of boats is 4000, manned by 20,000 fishermen; and the produce of the cod-fishery is estimated at 9000 tons of dried fish, 22,000 barrels of oil, and 6000 barrels of roe. After the cod-fishery has terminated (in April), the herring-fishing season comes on, and continues throughout the summer, forming also an important branch of national industry. Several other kinds of fish are caught, and lobsters and oysters in abundance. The fishing is attended with considerable danger, on account of the sudden and violent storms from the west, and of the strong currents which set in between the islands. See *MÆLSTROM*. The inhabitants are a mixed race, partly of Scandinavian, partly of Lappish descent.

LOG is the instrument by which a ship's rate of motion through the water is measured. Its simplest form is a triangular piece of light wood, loaded so as to swim vertically; this is connected with the

log-line so that its flat surface is at right angles to the ship's course. When thrown out—attached to the log-line (see *KNOT*)—the log meets with such resistance that it theoretically remains stationary in the water, and the log-line passing freely out shews the speed of the vessel. There are, however, many improved logs, which have complicated apparatus, for marking the way made, changes of direction, &c. The log and line are known to have been used as early as 1570 A.D., and were alluded to by

Log.

Bourne in 1577. Computing by the log is an uncertain operation, allowance having to be made for numberless contingent circumstances. In ships of war, it is usual to heave the log every hour; in merchantmen, every two hours. The *log-board* is a board on which the hourly results of the log-heaving are recorded in chalk, with the wind's direction, and other particulars, for the guidance of the officer in charge. The contents of the log-board are entered daily in the *log-book*, with all particulars essential to the history of the voyage, as ships spoken, icebergs seen, land sighted, &c. The *log-book* thus becomes a rough journal; and it is compulsory upon every master of a vessel to keep it properly, and to have it ready for inspection by any ship of war of his own nation whose captain may require its production.

LOGANIA'CEÆ, a natural order of exogenous plants, consisting of trees, shrubs, and herbaceous plants, with opposite entire leaves, and usually with stipules, which adhere to the footstalks, or form sheaths. The calyx is 4—5-partite; the corolla hypogynous, regular or irregular, 4—5 or 10-cleft. The stamens arise from the corolla. The ovary is generally 2-celled; there is one style. The fruit is a capsule, a drupe, or a berry. A few species of this order occur in Australia and in the temperate parts of North America; the rest are all tropical or sub-tropical. There are about 162 known species. No natural order of plants is more strongly characterised by poisonous properties. It includes the genus *STRYCHNOS* (q. v.), of which *NUX VOMICA* (q. v.) is one of the products, and another is the Woorali (q. v.) poison. *Strychnine* (q. v.) is a prevalent and peculiar characteristic principle of the Loganiaceæ. Some of the order, however, are of use in medicine, as certain species of *SPIGELIA* (q. v.).

LOGARITHMIC or LOGISTIC CURVES are curves whose abscissæ are proportional to the logarithms of the corresponding ordinates; consequently, if the abscissæ increase in arithmetical progression, the ordinates will increase in geometrical progression. The equation to these curves being $x = a \log y$ (a being constant), $y \frac{dx}{dy} = a$, shewing that the subtangent has the same value for all points of the curve, and is the Modulus (q. v.) of the system of logarithms represented by the particular curve. This curve has another remarkable property—viz., that the area contained between any two ordinates is equal to the difference of the ordinates multiplied by the constant subtangent.

LOGARITHMIC or LOGISTIC SPIRAL is a curve described by a point which moves uniformly along a uniformly revolving straight line. This

curve has several remarkable properties, some of which are analogous to those possessed by the logarithmic curve. Its involute and evolute are the same with itself. Newton shewed that if the force of gravity had varied inversely as the cube of the distance, the planets would have shot off from the sun in logarithmic spirals. The equation to the curve is $r = ce^{ax}$.

LOGARITHMS, a series of numbers having a certain relation to the series of natural numbers, by means of which many arithmetical operations are made comparatively easy. The nature of the relation will be understood by considering two simple series such as the following, one proceeding from unity in geometrical progression, the other from 0 in arithmetical progression:

Geom. series, 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, &c.
Arith. series, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, &c.

Here the ratio of the geometrical series is 2, and any term in the arithmetical series expresses how often 2 has been multiplied into 1 to produce the corresponding term of the geometrical series; thus, in proceeding from 1 to 32, there have been 5 steps or multiplications by the ratio 2; in other words, the ratio of 32 to 1 is compounded five times of the ratio of 2 to 1. It was this conception of the relation that led to giving the name of *Logarithms* to the arithmetical series, the word *logarithm* (Gr. *logon arithmos*) meaning 'the number of the ratios.' As to the use that may be made of such series, it will be observed that the sum of any two logarithms (as we shall now call the lower series) is the logarithm of their product; e. g., $9 (= 3 + 6)$ is the logarithm of 512 ($= 8 \times 64$). Similarly, the difference of any two logarithms is the logarithm of the quotient of the numbers; a multiple of any logarithm is the logarithm of the corresponding number raised to the power of the multiple, e. g., $8 (= 4 \times 2)$ is the logarithm of 256 ($= 16^4$), and a submultiple of a logarithm is the logarithm of the corresponding root of its number. In this way, with complete tables of numbers, and their corresponding logarithms, addition is made to take the place of multiplication, subtraction of division, multiplication of involution, and division of evolution.

In order to make the series above given of practical use, it would be necessary to complete them by interpolating a set of means between the several terms, as will be explained below. We have chosen 2 as the fundamental ratio, or base, as being most convenient for illustration; but any other number (integral or fractional) might be taken; and every different base, or *radix*, gives a different system of logarithms. The system now in use has 10 for its base; in other words, 10 is the number whose logarithm is 1.

The idea of making use of series in this way would seem to have been known to Archimedes and Euclid, without, however, resulting in any practical scheme; but by the end of the 16th c., trigonometrical operations had become so complicated that the wits of several mathematicians were at work to devise means of shortening them. The real invention of logarithms is now universally ascribed to John Napier (q. v.), Baron of Merchistoun, who in 1614 printed his *Canon Mirabilis Logarithmorum*. His tables only give logarithms of sines, cosines, and the other functions of angles; they also labour under the three defects of being sometimes + and sometimes -, of decreasing as the corresponding natural numbers increase, and of having for their *radix* (the number of which the logarithm is 1) the number which is the sum of

$1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \dots$, &c. These defects were,

however, soon remedied: John Speidell, in 1619, amended the tables in such a manner that the logarithms became all positive, and increased along with their corresponding natural numbers. He also, in the sixth edition of his work (1624), constructed a table of Napier's logarithms for the integer numbers, 1, 2, 3, &c., up to 1000, with their differences and arithmetical complements, besides other improvements. Speidell's tables are now known as *hyperbolic logarithms*. But the greatest improvement was made in 1615, by Professor Henry Briggs (q. v.), of London, who substituted for Napier's inconvenient 'radix,' the number 10, and succeeded before his death in calculating the logarithms of 30,000 natural numbers to the new radix. Briggs's exertions were ably seconded; and before 1628, the logarithms of all the natural numbers up to 100,000 had been computed. Computers have since chiefly occupied themselves rather in repeatedly revising the tables already calculated, than in extending them.

Construction of Tables.—The following is the simplest method of constructing a table of logarithms on Briggs's system. The log. of $10 = 1$; the log. of 100 (which is twice compounded of 10) $= 2$; the log. of 1000 $= 3$, &c.; and the logarithms of all powers of 10 can be found in the same manner. The intermediate logarithms are found by continually computing geometric means between two numbers, one greater and the other less than the number required. Thus, to find the log. of 5, take the geometric mean between 1 and 10, or 3.162..., the corresponding arithmetic mean (the log. of 1 being 0, and that of 10 being 1) being .5; the geometric mean between 3.162... and 10, or 5.623..., corresponds to the arithmetic mean between .5 and 1, or .75; the geometric mean between 3.162... and 5.623..., has its logarithm $= \frac{1}{2}(.75 + .5)$ or .625; this operation is continued till the result is obtained to the necessary degree of accuracy. In this example, the twenty-first result gives the geometric mean $= 5.000,003$, and the corresponding arithmetic mean $= .698,970$, which is in ordinary calculations used as the logarithm of 5. Since division of numbers corresponds to subtraction of logarithms, and since $2 = 1^2$, the log. of $2 = \log. 10 - \log. 5 = 1 - .698970 = .301030$. The logarithms of all prime numbers are found in the same way as that of 5; those of composite numbers are obtained by the addition of the logarithms of their factors; thus, the log. of $6 = \log. 2 + \log. 3 = .301030 + .477121 = .778151$. This method, though simple in principle, involves an enormous amount of calculation; and the following method, which depends on the modern algebraic analysis, is much to be preferred. According to this method, logarithms are considered as indices or powers of the radix; thus, $10^0 = 1$, $10^{.301030} = 2$, $10^{.477121} = 3$, $10^1 = 100$, &c.; and the laws of logarithms then become the same as those of indices. Let r represent the radix, y the natural number, x its logarithm; then $y = r^x$, or, putting $1 + a$ for r , $y = (1 + a)^x$; and it is shewn by the binomial and exponential theorems (see the ordinary works on Algebra) that $y = 1 + Ax + \frac{A^2x^2}{1.2} + \frac{A^3x^3}{1.2.3} + \dots$, where $A = r - 1 = \frac{1}{2}(r - 1)^2 + \frac{1}{3}(r - 1)^3 - \dots$, the former equation expressing a number as the sum of different multiples of its logarithm and the radix. If $\frac{1}{A}$ be substituted for x , then

$$y = r^{\frac{1}{A}} = 1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \dots = 2.71828182\dots$$

which, as before mentioned, is Napier's radix, and is generally called e ; then $r^{\frac{1}{A}} = e$, or $r = e^A$, or A

is the logarithm of r to the base or radix e . Then, referring to the above-mentioned value of A , we have, $\log. r$ (i. e., log. of r to the base e) $= r - 1 - \frac{1}{2}(r - 1)^2 + \frac{1}{3}(r - 1)^3 - \dots$, or, as before, putting $1 + a$ for r , $\log. (1 + a)$

$$= a - \frac{a^2}{2} + \frac{a^3}{3} - \dots; \text{ a series from which } \log. (1 + a) \text{ cannot be found, unless } a \text{ be fractional.}$$

However, if we put $-a$ for a , $\log. (1 - a) =$

$$-a - \frac{a^2}{2} - \frac{a^3}{3} - \dots; \text{ and subtracting this expression from the former, } \log. (1 + a) - \log. (1 - a) \text{ or}$$

$$\log. \left(\frac{1+a}{1-a} \right) = 2(a + \frac{a^3}{3} + \frac{a^5}{5} + \dots), \text{ and, for the}$$

sake of convenience, putting $\frac{u+1}{u}$ for $\frac{1+a}{1-a}$, in

which case, $a = \frac{1}{2u+1}$, we finally obtain $\log. \frac{u+1}{u} =$

$$= 2 \left\{ \frac{1}{2u+1} + \frac{1}{3(2u+1)^3} + \frac{1}{5(2u+1)^5} + \dots \right\}, \text{ or}$$

$$\log. (u+1) = \log. u + 2 \left\{ \frac{1}{2u+1} + \frac{1}{3(2u+1)^3} + \frac{1}{5(2u+1)^5} + \dots \right\}.$$

If 1 be put for u in this formula, the Napierian logarithm of 2 is at once obtained to any degree of accuracy required; if 2 be put for u , the Napierian logarithm of 3 can be calculated, &c. Now, as logarithms of any system have always the same ratio to one another as the corresponding logarithms of any other system, no matter what its base, if a number can be found, which, when multiplied into the logarithm of a certain number to one base, gives the logarithm of the same number to another base, this multiplier will, when multiplied into any logarithm to the first base, produce the corresponding logarithm to the other base. The multiplier is called the *Modulus* (q. v.), and for the conversion of Napierian into common or Briggs's logarithms, is equal to .4342944...; so that, to find the common logarithm of any number; first, find the Napierian logarithm, and multiply it by .4342944...

As in Briggs's system, the logarithm of 10 is 1; and that of 100 is 2; it follows that all numbers between 10 and 100 have, for their logarithms, unity + a proper fraction; in other words, the integer portion of the logarithms of all numbers of two figures is unity; similarly, the integer portion of the logarithms of numbers between 100 and 1000 is 2, and, in general, the integer portion of the logarithm of any number expresses a number less by unity than the number of figures in that number. This integer is called the *characteristic*, the decimal portion being designated as the *mantissa*.

As the logarithm of 1 $= 0$, the logarithms of quantities less than unity would naturally be negative; thus, the logarithm of $\frac{1}{2}$ would be $-.30103$ but, for convenience in working, the mantissa is kept always positive, and the negative sign only affects the characteristic; the logarithm of $\frac{1}{2}$ or .5 would thus be $\bar{1}.69897$, the characteristic in this and similar cases, expressing, when the fraction is reduced to a decimal, the number of places the first figure is removed from the decimal point; thus, the logarithm of .0005 is $\bar{4}.69897$.

Directions for the use of Logarithms in calculation will be found prefixed to any set of Tables. The history of the discovery is given in the preface to Dr Hutton's Tables.

The tables most distinguished for accuracy are

those of Callet (who edited Gardener's edition of *Sherwin's Tables*, making several additions and improvements), to seven places of decimals (Paris, 1821); Lalande, to five places (Paris, 1831); Hutton, to seven places (1849), issued in a more convenient form, with improvements, by Messrs W. and R. Chambers; the most accurate of all, however, are supposed to be those which Mr Babbage has produced with the aid of his ingenious calculating machine.

LOGGIA, an Italian word signifying an open arcade, enclosing a passage or open apartment. It is a favourite class of building in Italy and other warm countries. The Loggia de' Lanzi at Florence is one of the finest examples extant; and the Loggie of the Vatican, which are arcaded passages round the interior of the cortile of the palace, ornamented with beautiful paintings and arabesques by Raphael and his pupils, are well-known specimens.

LOGIC. This name denotes the science connected with the forms and methods of reasoning, and the establishment of truth by evidence. The science has come down to us from the Greeks, obtaining in great part the shape that we find it in from Aristotle, although he did not apply to it the name 'Logic.' This name, signifying originally both Thought and the Expression of Thought, must have been applied soon after the time of Aristotle. The most ancient name was 'Dialectic,' meaning literally, 'conversation,' 'colloquy,' or 'dispute.' (Hamilton's *Logic*, lect. 1.) 'But it appears that Aristotle possessed no single term by which to designate the general science of which he was the principal author and finisher. *Analytic*, and *Apodeictic* with *Topic* (equivalent to *Dialectic*, and including *Sophistic*), were so many special names by which he denoted the particular parts or particular applications of logic.'

The definition of logic has never been, till lately, a matter of serious controversy. There was formerly a substantial unanimity, with some variations in the form of the phraseology employed. We find it called usually the Art of Reasoning, or the Science of Reasoning, or both the one and the other. And by reasoning has been always understood *formal* reasoning, that is, inferences stated in such general language that they apply to all kinds of matter alike, as when in arithmetic we say three times four is twelve, without considering what the numbers are numbers of. A modification of this view has been adopted by Sir W. Hamilton: he calls logic the 'Science of the Laws of Thought as Thought.' The introduction of the larger word 'Thought' is considered requisite, because 'Reasoning' is somewhat too limited, there being processes included in logic, and necessary to the establishment of truth, which that word does not cover; such, for example, are Conception—the forming of general notions—and Judgment, the statement of propositions (see JUDGMENT). But the word 'Thought' having an acceptation co-extensive with all Intelligence, including Memory, Imagination, &c., as well as the operations concerned about truth, must be held to its narrower meaning, by which it simply includes the three great operations, constituting the distinct stages or divisions of logic, Conception, Judgment, and Reasoning.

Mr John Stuart Mill has propounded a radical innovation in the definition and province of this subject. According to him, logic 'is the science of the operations of the understanding which are subservient to the estimation of evidence; both the process itself of proceeding from known truths to unknown, and all other intellectual operations in so far as auxiliary to this. It includes, therefore, the operation of Naming; for language is an instrument

of thought, as well as a means of communicating our thoughts. It includes also Definition and Classification.'

This definition has the merit of setting distinctly forth the end of the science, which is the essential point in every *practical* science, as logic is. That end is the *estimation of evidence*, in other words, it is not the ascertainment of *all* truth, but of those portions of truth that are authenticated by means of other truths, or by *inference*. The proper conduct of the operation of inferring one thing from another is the final end of the whole science. And in laying down the true criteria of inference, a certain amount of study has to be bestowed upon some of the operations of the human understanding, not to the extent of converting logic into a system of mental philosophy, but simply so far as will conduce to the purpose in view. It is not, therefore, the 'laws of thought, as thought,' but the laws of thought as bearing upon the arts of inference, that Mr Mill would esteem the matter of the science.

But Inference is admitted on all hands to be of two kinds—Deductive or Formal Inference, and Inductive or Real Inference. In the one, no more is inferred than is already contained in the premises; for example, 'All men are mortal, therefore, the present generation of Englishmen will die,' is a formal inference; the conclusion is within, or less than, the premises. This is the kind of inference treated of in the Deductive or Syllogistic Logic, which was till lately the whole of the science. In the other kind of inference, a conclusion is drawn wider than the premises, so that there is a real advance upon our knowledge: from certain things directly ascertained we infer other things that have not been ascertained by direct experiment, and which, but for such inference, we should have had to determine in that manner. Thus, 'This, that, and the other piece of matter, in which actual observations have been made, gravitates,' therefore, 'all inert matter existing everywhere, known and unknown, gravitates,' is an inductive inference. Of this last class of inferences, all the inductive sciences, including Physics, Chemistry, Physiology, Mental Philosophy, &c., are made up. Accordingly, Mr Mill treats this as coming within the province of logic, no less than the Deductive, Formal, Syllogistic, or Necessary inference, which previous logicians had confined themselves to exclusively.

Sir W. Hamilton, in his system, admits the consideration of Induction under what he terms 'Modified Logic,' in contradistinction to 'Pure Logic,' or Formal Inference; and it has not been unusual for writers on the science to devote a chapter to Induction, after expounding the laws of the syllogism. But Mr Mill has given to the inductive part the predominance over the other, as being the more fundamental, as well as practically the more important of the two. Making logic co-extensive with Proof, he endeavours to shew that the establishment of the *premises*, from which the formal logician takes his start, is, after all, the main point, and that the other is subsidiary and subordinate, although still important to be attended to, and susceptible of being well or ill done. He further shews that there are rules, or methods of procedure, which may be set forth and followed in the inductive operation; that mankind often break those rules from ignorance or inadvertence (as well as from other causes); and that good may be done by explicitly calling attention to them, and making them a branch of education, as the old logic has for a long time been. See INDUCTION, SYLLOGISM.

LOGOGRAM (Gr. *logos*, a word, and *gramma*, a letter) is simply a complicated or multiplied form of the Anagram (q. v.) where the puzzle-monger,

instead of contenting himself with the formation of a single new word or sentence out of the old, by the transposition of the letters, racks his brain to discover all the words that may be extracted from the whole or from any portion of the letters, and throws the whole into a series of verses in which synonymic expressions for these words must be used. The puzzle lies in ascertaining what the concealed words are, and, through them, what is the primary word out of which they have all been extracted. A specimen is given in Henry B. Wheatley's book on *Anagrams* (1862), in which, out of the word 'curtains,' no less than 93 smaller ones are framed.

LOGOGRAPHERS, a name by which the Greeks designated their historians previous to Herodotus. The logographers described in prose the mythological subjects and traditions which had been treated of by the epic poets, supplementing them by traditions derived from other quarters, so as to form, at least in appearance, a connected history; their works, however, seeming to be intended rather to amuse their readers, than to impart accurate historical knowledge. The term was also applied to those orators who composed judicial speeches or pleadings, and sold them to those who required them.

LOGOMANIA, or **DISEASE OF THE FACULTY OF LANGUAGE**. It frequently happens that, while the idea is clear and distinct, all trace of its representative sound has disappeared; or another sign, or one conveying the converse of what is intended, is used. Such a condition is often associated with organic disease of the nervous structure, as in paralytics. In certain cases, there is an irresistible rapidity of utterance, or, apparently, an involuntary utterance of certain words or phrases foreign to the character of the individual. In another class of cases, memory appears to be chiefly at fault; there may be the oblivion of all words; the forgetfulness of certain classes of words, such as substantives, while others are recollected and correctly applied; the forgetfulness of particular words, as of the individual's own name; or of parts of words, as occurs in general paralysis, where the last or penultimate syllable escapes attention, and is generally omitted; or there may be confusion as to orthography, and this has been observed when limited to a single letter. Dr Graves, Dublin, mentions a farmer who retained a knowledge of all parts of speech except nouns and proper names; but even of these he recollected the initial letter: he carried a pocket-dictionary, and when about to use such words as 'Cow' or 'Dublin,' turned to the letters 'C' and 'D,' and then recalled what he wished. Patients are found who impose upon themselves a mutism as to certain phrases, and limit their vocabulary to particular expressions. In others, there is invariably a transposition of words; such as when, in place of saying, 'The rose is beautiful,' a paralytic recasts the sentence, 'Beautiful rose is,' and all other sentences in a similar fashion. Fever, in Mezzofanti, is said to have swept away, in an hour, his vast acquisitions in sixty languages; in other cases, it has recalled dialects forgotten for half a century; and mere excitement seems capable of inventing or inspiring a vast number of sounds assuming the aspect, and even the relations of a language so closely as to suggest doubts as to whether they are creations such as those of Palmanazar, which deceived the linguists of the Royal Society, or those ebullitions of devotional feeling designated 'unknown tongues.' In other forms of disease, the cries of animals or natural signs are resorted to in place of words; or

the ordinary language is sung or chanted, or used rhythmically; or a foreign language may be employed or imitated. The bearing of such alterations upon the philosophy of mind, and upon any theory as to the origin of language, must be obvious; but they possess a still more intimate connection with the amount of intelligence and responsibility predicable in every case of disease of the nervous system.—Calmiel, *De la Paralyse considérée chez les Aliénés*; *Phrenological Journal*, No. 47; Coleridge, *Biographia Literaria*, vol. i. p. 112.

LOGOS (Gr. from *lego*, 'I speak') denotes the act of speaking; that which is spoken; the natural process gone through for the purpose of the formation of speech; the reasoning powers themselves:—all the attributes and operations of the soul, in fact, as manifested by the spoken word. It thus occurs in the classical writers under the manifold significations of word or words, conversation, oration, exposition, command, history, prose, eloquence, philosophical proposition, system, reason, thought, wisdom, and the like. Theologically, the word *logos*, as occurring at the beginning of the gospel of St John, was early taken to refer to the 'second person of the Trinity, i. e., Christ.' Yet what was the precise meaning of the apostle, who alone makes use of the term in a manner which allows of a like interpretation, and only in the introductory part of his gospel; whether he adopted the symbolising usage in which it was employed by the various schools of his day; which of their widely differing significations he had in view, or whether he intended to convey a meaning quite peculiar to himself:—these are some of the innumerable questions to which the word has given rise in divinity, and which, though most fiercely discussed ever since the first days of Christianity, are far from having found a satisfactory solution up to this moment. The fact, however, is, that the notion of a certain manifestation or revelation out of the centre of the Godhead, as it were,—which manifestation, as a more or less personified part of the Deity, stands between the realms of the infinite and the finite, of spirit and matter—has from times immemorial been the common property of the whole East, and is found expressed in the religions of the primitive Egyptians, as well as in those of the Hindus and Parsees. This notion of an embodiment of divinity, as 'Word' or 'Wisdom,' found its way, chiefly from the time of the Babylonian exile, into the heart of Judaism, which in vain endeavoured to reconcile it with the fundamental idea of the Divine Unity. The apocryphal writers chiefly pointed to the 'Wisdom'—of which Solomon (Prov. viii. 22) says that it had dwelt with God from the beginning, and Job (xxviii. 20), that it had assisted in the creation—as the emanation of God, which emanation was supposed to be bodily to a certain, however minute, degree. Thus, Sirach (xxv. 1, 23) understands the 'Spirit of God' (Gen. i. 2) to be a kind of veil or mist, and speaks (i. 9) of the 'wisdom that is of the Lord and is with the Lord, everlasting,' and that 'it was created before all things, and known unto Him' (ib.).

This *Wisdom*, or *Word* of creation, which, according to Sirach's view, formed and developed the chaos, further manifested itself—visibly—by a direct and immediate influence upon one select people, Israel, through which it wished further to influence all mankind. A nearer acquaintance with this doctrine in all its bearings at once solves the old riddles of certain Targumic interpretations, which have puzzled a host of investigators. Thus versions like that of Targum Jerushalmi to Gen. i. 1, 'With *Wisdom*, God created heaven and earth,' and the constant use of the term *Memra* (Word) instead of

God or Jehovah, become clear at once (see TARGUM, VERSIONS). No less must many passages in the Talmud and Midrash assume an entirely different aspect, if that prevalent mode of thought and speech is taken into consideration.

In the earlier Platonic schools, again, *Logos*, *scil.*, of God, was the common term for 'Plan of the Cosmos' or 'Divine Reason,' inherent in the Deity. The later schools, however, more prone to symbol and allegory in philosophical matters, called *Logos* a 'Hypostasis of Divinity,' a substance, a divine corporeal essence, as it were, which became outwardly visible—a separate Being, in fact, which, created out of the Creator, became 'the Son of the Creator.'

But above all, we have, for the proper consideration of the usage in the days of the apostles, to examine the Judæo-Alexandrine views on this point. Philo, who is their best representative, makes the *Logos* the all-comprising essence of spiritual powers (Daimons, Angels), which alone acts upon the universe. In this sense, the *Logos* stands as the *Divine Reason*, the *Power of all Powers*, the *Spirit of God*, and His *Representative*, between Him and all else. Nay, he goes so far as to call it the *Archangel*, who executes the behests of God to man; the *High-priest*, who prays for man, and interferes on his behalf, before the throne of the Almighty; and he finally speaks of *Logos* as 'the second God' (*De Somn.* i. 655), and the 'Providence' (Fate, Fortune) which watches over the destinies of mankind and separate nations (*Quod Deus*, i. 298). These conceptions, which, he says, came to him in a trance, he does not allow, however, to be in the least derogatory to the strictest belief in the oneness, invisibility, and pure spiritualness of God, such as it is taught in the Jewish creed.—This characterises sufficiently the general vagueness and haziness of philosophical and theological parlance and speculation in the Alexandrine schools, which, obviously unconscious of the palpable contradictions uttered in one breath, mixed up pure thought and visions, Scripture with eastern and western philosophy and theosophy, monotheism and polytheism, heaping systems upon systems, and dreams upon dreams.

If the apostle did not himself, to a certain degree, stand under the influence of some of the popular ideas connected with the term under consideration, it would, at anyrate, seem most natural that he made use of it, as of one conveying a certain vague, yet commonly recognised transcendental notion of a divine emanation to the minds of his contemporaries. This opinion, however, is far from being unanimously adopted. Thus, some investigators hold that John, irrespective of the parlance of his day, used the word *Logos* for *Logomenos*, i. e., He of whom it has been spoken, the Promised one; others identify it with 'doctrine;' while a third notion (held among others by Calvin and Luther) would make it equal to monologue, conversation.

For the person of the *Logos* as the mediator (*Eon*, *Demiurgos*, &c.), and the respective relation between him and the other persons of the divine triad, we must refer to the articles *CHRIST*, *GNOSTICS*, *TRINITY*.

LOGROÑO (Lat. *Julia Briga*), a town of Spain, capital of the province of Logroño, is situated on the Ebro, 60 miles east of Burgos. It is surrounded by walls, has several churches, convents, a theatre, college, some manufactures, and a good trade in rural produce. Pop. 10,466.

LOGWOOD, the dark red solid heart-wood of *Hæmatoxylon Campechiæ*, a tree of the natural order *Leguminosæ*, sub-order *Casaliptinæ*. This tree grows in Mexico and Central America, and is

perhaps a native of some of the West India Islands; but is said to have been introduced into Jamaica in the beginning of the 18th c., although it is now naturalised there. It is the only known species of its genus. It grows to a height of 20–50 feet; the leaves are pari-pinnate; the racemes many-flowered, and longer than the leaves. The sapwood is yellowish, and being worthless, is hewed off with the bark. The heart-wood is heavier than water, close-grained, but rather coarse. It has a slight smell resembling that of violets, a sweetish taste, is astringent, and contains a distinguishing crystalline principle, called *Hæmatoxyline* (q. v.).

No dye-wood is imported in such large quantities as L.; nearly 50,000 tons are annually sent to Great Britain. It was first introduced in the reign of Queen Elizabeth, but the colour was found to wash out, and the dyers not knowing how to fix it, much dissatisfaction was occasioned by the sale of cloths dyed with it, and an act of parliament was passed prohibiting its use. This act was repealed in 1661, since which time it has been constantly in use, science having shewn means for fixing. L. is imported in large billets or logs, usually about 4 feet in length, 18 inches in diameter, and of very irregular shape; the larger they are, the greater their value; the colour is a dark blood-red, becoming almost black after long exposure. The infusion of the wood is also blood-red, which colour it yields readily to boiling water; it is changed to light red by acids, and to dark purple by alkalies. In dyeing with L., an alum mordant gives various shades of purple and violet—with the solution of tin, it gives violet, red, and lilac; with the sulphate or acetate of iron, it gives a black; but this is greatly improved in depth and softness, if gall-nuts are also used, which is generally the case. It is also one of the ingredients in both black and red ink; but Brazil-wood is usually preferred for the latter.

LOIR-ET-CHER, a department of France, lying on both sides of the river Loire, and formed of part of the old province of Orléannois, comprises the arrondissements of Blois, Vendôme, and Romorantin. Area, 1,568,677 square acres; pop. (1862) 289,029. The department is almost a uniform plain, broken only by vine-hills of trifling elevation. The northern part is more fertile than the south, three-fourths of which is occupied by marshes, heaths, and forests—the last of which, indeed, cover one-sixth of the entire surface. The chief products are corn, fruits, hemp, wine, and vegetables of all sorts. The rearing of sheep, poultry, and bees, is carefully attended to, and there are also manufactures of woollens, cottons, leather, glass, &c. Principal towns, Blois, Romorantin, and Vendôme.

LOIRE (ancient *Liger*), the longest river in France, has its source in the Cevennes Mountains, near Gerbier-des-Jones, in the department of Ardèche, at an elevation of 4550 feet, flows in a north-north-western direction through the centre of France as far as Orleans, where it bends round to the south-west as far as Tours, and thence follows, in general, a western course to its embouchure in the Bay of Biscay. Entire length, 530 miles. It becomes navigable a little above Roanne, at a distance from the sea of 450 miles. At one time, the depth of the water at its mouth was 18 feet at ebb-tide; now, it is only from 6 to 9 feet. The lower course of the L. is adorned by wooded islets. In the lower part of its course, large dikes or *levées* have been built, to protect the surrounding country from inundations, from which, however, they sometimes suffer terribly. It receives about 40 affluents, of which the principal are, the Loir, on the right;

and the Allier, the Cher, the Indre, and the Vienne, on the left.

LOIRE, a department in the south-east of France, formerly part of the province of Lyonnais, comprises the arrondissements of Montbrison, Roanne, and St Etienne. Area, 1,178,234 English acres; pop. (1862) 517,603. The basin of the Loire, which flows through this department, is a rather unfruitful valley, but the mountains are rich in iron and lead, and the coal-fields of the department are the richest in France. L. is also noted for the rearing of silkworms, and for the excellence of its silk manufactures. The weaving of hemp and linen is also largely carried on. Its mineral springs are in great repute, especially those of St Alban, Sail-sous-Couzan, and St Galmier. The chief towns are St Etienne, Roanne, Rive-de-Gier, and Montbrison.

LOIRE, HAUTE, a central department of France, bounded on the south by the departments of Lozere and Ardeche. Area, 1,212,160 square acres; pop. (1862) 305,521. The surface is mountainous; covered by the Cevennes, the Cantal Mountains, and the Margaride chain, whose slopes are clothed with forests, and whose peaks are during about half the year covered with snow. Chief rivers the Loire and the Allier. The soil of the plains is fertile, and the agricultural produce of the soil consisting of the usual crops with fruits is abundant. The climate is very various, owing to the irregularity of the surface. The arrondissements are Le-Puy, Yssengeaux, and Brioude; the capital, Le-Puy.

LOIRE-INFÉRIEURE, a maritime department in the west of France, formed out of the southern portion of the old province of Brittany, and comprising the arrondissements of Nantes, Ancenis, Paimboeuf, Châteaubriant, and Savenay, lies on both sides of the river Loire. Area, 1,697,979 English acres; pop. (1862) 580,207. In the south of the department lies Grand-Lieu, the largest lake in France. The interior is, on the whole, flat, but the north-east and south-east are slightly hilly. The soil is fertile, producing wheat, rye, and barley, and forming in some parts rich pasturage. There are also some fine forests. Salt marshes are numerous in the west. The vineyards yield annually about 32 million gallons of wine. Ship-building is carried on extensively at Nantes. The coast-fisheries and general export trade of the department are extensive. Capital, Nantes; none of the other towns are large.

LOIRET, a central department of France, formed out of the eastern portion of the old province of Orlannois, and comprising the arrondissements of Orleans, Montargis, Gien, and Pithiviers, lies on both sides of the river Loire. Area, 1,670,984 English acres; pop. (1862) 352,757. The country is, for the most part, an elevated and fruitful plain, abounding in corn and wine—known as the plateau of Orleans; but the district along both banks of the Loire, called the *Sologne*, is a barren, sandy tract. L. contains several large forests. Cattle, sheep, and bees are extensively reared, and mineral springs are numerous.

LO'JA, a town of Spain, in the province of Granada, is situated on the slope of a hill near the left bank of the Xenil, 31 miles west of Granada, and 41 north-north-east of Malaga. Pop. 14,700. L. is a thriving place, with 21 woollen factories, 3 paper-mills, and two hospitals, and was once of great military importance, being the key to Granada. The summit of the slope on which the town is built is crowned with the ruins of a Moorish castle.

LOKEREN, a town of Belgium, province of East Flanders, on the Durme, 12 miles east-north-east of Ghent. It is a station on the Ghent and Antwerp Railway. Pop. 17,100. L. is a well-built town, with numerous schools, benevolent institutions, important manufactures of linen, cotton, and woollen goods, and large bleach-fields.

LOKI, a demi-god in the Scandinavian mythology. He did not belong to the race of the Aesir (see ASERS), but to an older dynasty. Still, we find him from the very first on terms of intimacy with Odin, and received among the Aesir. His appearance is beautiful, and he is possessed of great knowledge and cunning. He often brings the new gods into difficulties, from which, however, he again extricates them. Hence he is to be regarded as the principle of strife and disturbance in the Scandinavian mythology; the 'Spirit of Evil,' as it were, mingling freely with, yet essentially opposed to, the other inhabitants of the Norse heaven, very much like the Satan of the Book of Job. By his artful malice, he caused the death of Balder (q. v.), and was in consequence visited by the Aesir with most terrible punishments. He is sometimes called *Ass-Loki*, to distinguish him from *Utgarda-Loki*, a king of the giants, whose kingdom lies on the uttermost bounds of the earth; but these two are occasionally confounded. It is quite natural, considering the character of L., that at a later period he should have become identified with the Devil of Christianity, who is called in Norway, to the present day, *Loake*.

LOKMÂN (ABU AMAN?), a fabulous personage; the supposed author of a certain number of Arabic fables. He is by some Arabic writers called a nephew of Job or Abraham; by others, a councillor of David or Solomon; others, again, identify him with Balaam, whose name signifies, like that of L., the *Devourer*. Equal uncertainty reigns respecting his native place and occupation. Thus, he is variously held to have been an Ethiopian slave, conspicuous for his ugliness; a king of Yemen; an Arabic tailor; a carpenter; a shepherd; and the like. Most probably, the circumstances and sayings of several men living at different periods have been fathered upon L., of whom Mohammed (Surah 31) says that to him 'has been given the Wisdom.' There is also a great likeness to be recognised between himself and his fables and Aesop and those current under the latter's name. According to the Arabic writers, to L., as the Ideal of Wisdom, the kingdom of the world was offered, but was by him declined—provided this was no offence against piety—because he felt much happier as he was; and that when asked what was the secret of the goodness and wisdom of all his deeds, he replied: 'It is this: I always adhere to the truth; I always keep my word; and I never mix myself up with other people's affairs.'

The fables that go by L.'s name are for the most part Indian apologies, which were first rendered into Greek, thence into Syriac, and finally into Arabic. They are, in this last form, of a comparatively recent date, and thus unknown to all the classical writers. The language is very corrupt, and it is highly to be regretted that the book, for want of anything better, still holds its rank as an elementary book for Arabic students. Its first redaction is, according to a note to a manuscript in the Imperial Library in Paris (Suppl. No. 58), due to an Egyptian Christian, Barsuma, who probably lived towards the end of the 13th century. The first edition, with a Latin translation, by Eberhardus, appeared at Leyden (1615). The book has been frequently translated into European languages—into French, by Tannegey, Schier, &c.; into Spanish, by

Miguel Garcia Ascensio, &c.; into Danish, by Rask; into German, by Olearius, Schaller, &c. Recent editions are by Bernstein (Gött. 1817), Causain de Perceval (Paris, 1818), Freytag (Bonn, 1823), Rödiger (Leip. 1830, &c.), Schier (Dres. 1831), Rasch (Copenh. 1832), Derenburg (Berl. 1850), &c.

A book, *Amthal* (Parables), ascribed to L., and supposed to contain more than a thousand apologies, maxims, parables, sentences, &c., has never been discovered. L.'s supposed grave is shewn at Ramlah, near Jerusalem.

LOLIUM. See DARNEL and RYE-GRASS.

LOLLARDS, or LO'LLHARDS, a semi-monastic society, the members of which devoted themselves to the care of the sick and of the dead. It was first formed about the year 1300 in Antwerp, where some pious persons associated themselves for the burial of the dead. They were called from their frugal life, and the poverty of their appearance, *Matemans*; also, from their patron saint, *Brethren of Saint Alexius*; and, on account of their dwelling in cells, *Fratres Cellite*; whilst they acquired the name L. from their practice of singing dirges at funerals—the Low-German word *lollen*, or *lullen*, signifying to sing softly or slowly. They soon spread through the Netherlands and Germany, and in the frequent pestilences of that period, were useful, and everywhere welcome. The clergy and the begging-friars, however, disliked and persecuted them, classing them with the heretical *Beghards* (see *BEQUINES*), till Gregory XI. took them under his protection in 1374. Female Lollard societies were formed in some places. The L. having been reproached with heresy, their name was afterwards very commonly given to different classes of religionists, sometimes to the truly pious, sometimes to the worst pretenders; and in England, it became a designation of the followers of Wicliffe (q. v.), and thus extended into Scotland, where the *L. of Kyle* (in Ayrshire) attracted attention, and became the objects of persecution in the end of the 15th century.

LOMBARD, PETER (rather, Peter the Lombard), one of the most famous of the Schoolmen, was born at a village near Novara, in Lombardy. He was a pupil of Abelard, afterwards became a teacher of theology in Paris, and in 1159 was appointed Bishop of Paris. Bayle says that he was the first who obtained the title of Doctor of Theology in the university of Paris. He died at Paris in 1164. He was very generally styled *Magister Sententiarum*, or the *Master of Sentences*, from his work *Sententiarum Libri IV.*, an arranged collection of sentences from Augustine and other Fathers, on points of Christian doctrine, with objections and replies, also collected from authors of repute. It was intended as a manual for the scholastic disputants of his age, and as may be inferred from what has just been said, is a compilation rather than an original work. It was the subject of many commentaries down to the time of the Reformation. The works of Peter L. were edited by Aleaume (Louvain, 1546).

LOMBARD ARCHITECTURE is the style which was invented and used by the Gothic invaders and colonists of the north of Italy, from about the age of Charlemagne till it was superseded by the importation of the pointed style from France in the beginning of the 13th century. The architecture of the Lombards was derived from the Romanesque (q. v.), or debased Roman style which they found in the country—the general plan of the churches, and the general form of the pillars, arches, &c., being almost identical with that of the Roman Basilicas (q. v.). But in detail, there is no such resemblance; the Roman traditions are entirely abandoned, and instead of

the debased acanthus leaves and fragments of entablatures, so characteristic of the Romanesque style, the Lombards adopted a freer imitation of natural forms in their foliage, and covered their buildings with representations of the fights and hunting-expeditions in which they delighted. On their first arrival in Italy, they used Italian workmen; but when their own people became more numerous, they also laid aside the sword for the trowel. Accordingly, wherever in North Italy the Lombards were numerous, their style prevailed; and where the Romans predominated, the Romanesque prevailed. The north of Italy belonged naturally, at the time of Charlemagne, to the great German empire, and thus we find nearly the same style of architecture in Lombardy and in Germany as far north as the Baltic. See *RHENISH ARCHITECTURE*. Few early examples of Lombard architecture exist. In the unruly times when the style originated, the buildings were no doubt frequently destroyed by fire; this seems to have led to the desire to erect fireproof structures, and thus the earlier as well as almost all the later examples are vaulted with stone, whereas the Romanesque basilicas are generally roofed with wood. This stone roof seems to have been the great desideratum in the new style. The earliest example is a small chapel at Friuli, built probably during the 8th c., and it is covered with an intersecting vault. Examples of this date are rare in Italy; but in Switzerland, where the style is almost identical, several interesting specimens of early architecture remain, such as the churches of Romain-Motier, Granson, Payerne, &c., in which the transition from the Romanesque to the round arched Gothic is very clearly traceable. We there find the peculiar arch-ornament so characteristic of Lombardy and the Rhine (fig. 1), and we can trace the timid steps by which the Goths advanced in the art of vaulting.

Fig. 1.

The vaulting is the leading feature of Lombard architecture, and from it spring the other distinguishing forms of the style. Thus, the plain, round pillars, with a simple base and capital, which served to support the side-walls and roof of a basilica, are changed for a compound pier, made up of several shafts, each resting on its own base, and each provided with a capital to carry the particular part of the vaulting assigned to it. This change is deserving of particular notice as the first germ of that principle which was afterwards developed into the Gothic Style (q. v.). Buttresses are also introduced for the first time, although with small projection.

The *Cathedral* of Novara is one of the most striking examples of Lombard architecture. It belongs to the 11th century. The plan (fig. 2) shews the arrangement common at this epoch all over the German empire. It is derived from the old basilican type, having at the west end an open atrium, with arcade around, from which the church is entered by a central door. The interior is divided into central and side aisles, with vaulted roof, and terminated with an apsidal choir. At the end of the atrium opposite the church, is situated the baptistery. At Asti, there is an interesting example of the early Lombard Baptistery. The same general arrangement of plan afterwards became common in the German churches, the atrium being roofed over and included in the nave, and the baptistery forming the western apse of the double-apsed churches. The elevation of Novara is ornamented with those arcades and arched

a link between the Romanesque of Italy and the Gothic of the Cisalpine countries. On the one hand, its origin can be traced back to the Roman basilicas; while on the other it embodied those principles from the development of which sprang the great Gothic style of the middle ages.

LOMBARDS, a German people of the Suevic family, not very numerous, but of distinguished valour, who played an important part in the early history of Europe. The name is derived from *Longobardi*, or *Langobardi*, a Latinized form in use since the 12th c., and is generally supposed to have been given with reference to the long beards of this people; although some derive it rather from a word *porta*, or *baria*, which signifies a battle-axe. About the 4th c., they seem to have begun to leave their original seats (on the Lower Elbe, where the Romans seem to have come first in contact with them about the beginning of the Christian era), and to have fought their way southward and eastward, till they came into close contact with the eastern Roman empire on the Danube, adopted an Arian form of Christianity, and after having been for some time tributary to the Heruli, raised themselves upon the ruins of their power, and of that of the Gepids, shortly after the middle of the 6th c., to the position of masters of Pannonia, and became one of the most wealthy and powerful nations in that part of the world. Under their king Alboin (q. v.), they invaded and conquered the north and centre of Italy (568—569). The more complete triumph of the L. was promoted by the accession of strength which they received from other German tribes following them over the Alps—Bulgarians, Saraceni, Pannonians, Norici, Alemanni, Suevi, Gepids, and Saxons—for the numbers of the L. themselves were never very great.

The L., after the example of the Romans themselves in the conquests of former times, were for the most part contented with a third of the land or of its fruits. One of their kings, Authari (584—590), assumed the title of Flavius, which had been borne by some of the later Roman emperors, and asserted the usual claims of a Roman ruler, whilst the administration of the Lombard kingdom was soon so superior to that which then prevailed in other parts of Italy, that to many the change of masters was a positive relief from unjust and severe exactions. Whilst the higher nobility, however, in general retained some portion of their former wealth and greatness, the possession of small properties became fewer in number, and sunk into the class of mere cultivators, to whom it was comparatively indifferent whether they acknowledged a Roman or a Lombard superior. The rights of the municipal corporations also, although acknowledged, were gradually abridged, partly through the encroachments of the Lombard dukes, and partly through those of the higher clergy, till few relics of their ancient self-government remained. These few, however, were the germs from which, at a subsequent period, the liberties of the independent Italian cities were developed.

The conversion of the Arian L. to the orthodox faith was brought about by the policy of Gregory the Great and the zeal of Theodolinda, wife of Authari, and subsequently of his successor, Agilulf (590—615).

Theodolinda persuaded Agilulf to restore a portion of their property and dignities to the Catholic clergy, and to have his own son baptised according to the Catholic rites. She also built the magnificent Basilica of St John the Baptist at Monza, near Milan, in which in subsequent times was kept the Lombard crown, called the *Iron Crown* (q. v.). The L. were

belong fully united to the Roman Catholic Church. The contests of the dukes prevented the firm consolidation of the kingdom, or any very considerable extension of its boundaries. The *Edict* of the Lombard king, Rothari (638—654), declaring the laws of the L., promulgated 22d November 643, is memorable, as having become the foundation of constitutional law in the Germanic kingdoms of the middle ages. It was revised and extended by subsequent Lombard kings, but subsisted in force for several centuries after the Lombard kingdom had passed away. The L., however, gradually became more and more assimilated to the former inhabitants of the land of which they had made themselves lords; their rudeness was exchanged for refinement, and the Latin language prevailed over the German, which they had brought with them from the other side of the Alps. But of the original Lombard language little is known, nothing remaining to attest its certainly German character except a few words and names, the very ballads in which the stories of Lombard heroes were recorded having only come down to us in Latin versions.

Liutprand (713—744), raised the Lombard kingdom to its highest prosperity. He quelled with strong hand the turbulence of the nobles, gave the finishing blow to the exarchate of Ravenna, and sought to extend his dominion over all Italy. But the popes now entered upon that Macchiavellian policy which they long incessantly pursued, of labouring to prevent a union of all Italy under one government, in order to secure for themselves the greater power in the midst of contending parties. This, with the disputes which arose concerning the succession to the Lombard throne, led to the downfall of the Lombard kingdom within no long time after it had reached its utmost greatness. The popes allied themselves with the Frankish kings, and Pepin, who had been anointed by Stephen II. to the 'patriciate,' i. e., the governorship of Rome, invaded Italy (754), and compelled the Lombard king Aistulf (749—754), who cherished the same ambitious designs as Liutprand, to refrain from further conquests, and even to give up some of the cities which had already yielded to his arms, which Pepin (755) bestowed upon the Roman Church and commonwealth. New causes of hostility between the Frank and Lombard monarchs arose when Charlemagne sent back to her father his wife, the daughter of the Lombard king Desiderius (754—774), and Desiderius supported the claims of the children of Carloman, Charlemagne's brother. In the autumn of 773, Charlemagne invaded Italy; and in May of the following year, Pavia was conquered, and the Lombard kingdom, after an existence of 206 years, was overthrown. In 776, an insurrection of some of the Lombard dukes brought Charlemagne again into Italy, and the dukedoms were broken down into counties, and the Lombard system, as far as possible, supplanted by that of the Franks. In 803, a treaty between Charlemagne, the western, and Nicephorus, the eastern emperor, confirmed the right of the former to the Lombard territory, with Rome, the Exarchate, Ravenna, Istria, and part of Dalmatia; whilst the eastern empire retained the islands of Venice and the maritime towns of Dalmatia, with Naples, Sicily, and part of Calabria. Compare Türk's *Die Longobarden und ihr Volkrecht* (Bost. 1835); and Flegler's *Das Königreich der Longobarden in Italien* (Leip. 1861).

LOMBARDY, the name given to that part of Upper Italy which formed the 'nucleus' of the kingdom of the Lombards (q. v.). It consisted of the whole of Italy north of the peninsula, with the exceptions of Savoy and Venice, and after the fall of the Lombard kingdom, in 774, was incorporated

in the Carolingian empire. In 843, it was created a separate kingdom, but was not entirely severed from the Frankish monarchy till 888. From this time it was ruled by its own kings till 961, when it was annexed to the German empire. Out of the wrecks of the old independent kingdom now arose a number of independent duchies, as Friuli, Mantua, Susa, Piedmont, &c., and soon afterwards the republics of Venice, Genoa, Milan, and Pavia. These republics consisted of one sovereign town, surrounded by, in many cases, a large extent of dependant territory. The Lombard cities declared themselves independent towards the commencement of the 12th c., and in 1167 were joined by their less powerful neighbours in the 'first Lombard league,' for the maintenance of their liberties, against Frederic Barbarossa, whom they severely defeated in 1176. In 1225, they were compelled to form the 'second Lombard league' against Frederic II., and with similar success. About this time, petty tyrants arose in most of the cities, and the country was distracted by internal dissensions, which were carefully fostered by France and Germany. These two great powers and Spain strove for the possession of Lombardy. The last succeeded in obtaining it in 1540, and held possession till about 1706, when after another dispute, the duchies of Milan and Mantua (the country bounded by the Ticino, Po, Mincio, and Switzerland), which alone now retained the name of L., came into the hands of Austria, and were designated 'Austrian Lombardy.' In 1796, it became part of the Cisalpine republic, but in 1815 was restored to Austria, and annexed politically to the newly-acquired Venetian territory under the name of the Lombardo-Venetian Kingdom. This union was dissolved in 1859 by the Italian war; L. was given up to the new kingdom of Italy, Austria, however, retaining her Venetian territory. There is now no official division called L., the country having been parcelled out into the provinces of Bergamo, Brescia, Como, Cremona, Milan, Pavia, and Sondrio. Its total area was 8264 English square miles, with a population (1856) of 3,039,056.

The northern districts of L. are alpine in character, but the rest of the country is of extraordinary fertility, induced chiefly by the universal practice of irrigation. The country is celebrated for the products of its pasture-land, and as much as 50,000,000 lbs. of cheese is annually produced in the dairies of Lombardy. Agriculture is here in a more advanced state than in any other part of Italy, wheat, rice, and maize being the principal crops; melons, gourds, oranges, figs, citrons, pomegranates, peaches, plums, and other fruits of excellent quality, are largely produced. The numerous mulberry plantations form another prominent feature, and vines are extensively cultivated, though the wine produced from them is of inferior quality. Various kinds of marble, some of them of great beauty, form the chief item in the mineral products of L.; a few iron mines exist in Como and Bergamo. The chief manufactures are silk, cotton, and woollen goods, flax, paper, glass, and pottery; the annual value of the silk exceeds £3,000,000. Education is very generally diffused among the people, and they are well supplied with newspapers and scientific and literary journals.

LOMBOK, an island in that crescent group in the Malayan Archipelago known as the Sunda Islands. It lies between Bali on the west, and Sumbawa on the east; lat. from 8° 12' to 9° S., long. from 115° 44' to 116° 40' E. Area estimated at 1490 square miles; pop. at 200,000, who are all Mohammedans. The north and south coasts are each traversed by a chain of mountains, some of which are volcanic, but

the interior is a fertile valley. Rice and cotton are largely cultivated, 20,000 tons of the former being exported annually. The capital is Mataram, the principal seaport, Ampanam.

LOMENTUM. See **LEGUME**.

LO'MOND, Loch, the largest of the Scottish lakes, lies between Dumbartonshire on the west, and the counties of Stirling and Perth on the east. It is 24 miles long, is 7 miles broad at the southern extremity, though the northern half is only about a mile in width, and has an area of 45 square miles. Its depth varies from 60 to 600 feet, and its surface is only about 22 feet above the level of the sea. The waters of the loch are swelled by the contributions of many streams, the chief of which is the Endrick, from the south-east; the surplus waters are carried off by the Leven, an affluent of the Clyde. The lower portion of the loch is surrounded by a hilly but well-cultivated and finely wooded country, and the character of the scenery is in the highest degree rich and beautiful. Around the northern portion of the loch are piled high, wild, and picturesque masses of mountains—Ben Lomond on the east, and the Arrochar hills on the west. The surface is dotted over with numerous islands, which are finely diversified in their general appearance, and contribute greatly to the exquisite beauty of the scene. Several steamers ply on the lake.

LO'MZA, a district town in the government of Augustovo, in Poland, on the left of the Narev, a tributary of the Vistula, and 85 miles north-east of Warsaw, played a prominent part in the history of Poland, but has never recovered from its sufferings during the Swedish wars. L. has a college, a gymnasium, an arsenal, and several paper-mills, and cloth and linen factories in its neighbourhood. Pop. 6043.

LO'NDON, the capital of the British empire, stands on both banks of the Thames, about 60 miles from the sea. The dome of St Paul's is in lat. 51° 30' 48" N., and in long. 5° 48' W. The river here varies from 900 to 1200 feet in width.

London, under the names *Londinium*, *Londinum*, and *Augusta*, was one of the chief stations of the Romans in Britain. They encircled a portion of what is now the City with a wall, which was rebuilt and extended in later ages. In Stow's time, the remains of the Norman or Anglo-Norman wall were about two miles in extent, from the Thames at the Tower to the Thames at Blackfriars. The great fire of 1666, and continual reconstructions in later ages, have nearly obliterated all traces of the old wall. The seven gates which pierced it are entirely gone, *Temple Bar* being merely one of the outer bars or suburban gates.

It is almost impossible to say what is the size of L., because there is no definite number of surrounding villages and parishes included within it. 'London within the walls,' the original City, comprises only 370 acres; 'London without the walls' comprises 230 acres; then there are the city of Westminster and the borough of Southwark; the 'Tower Hamlets,' comprising Bethnal Green, Whitechapel, Stepney, Mile End, Poplar, &c.; the northern suburbs of Marylebone, Pancras, Hampstead, Islington, Hackney, &c.; the western suburbs of Kensington, Chelsea, Fulham, Paddington, &c.; many parishes in the centre, but westward of the City; Bermondsey, Lambeth, Newington, Wandsworth, Rotherhithe, &c., in Surrey; and Deptford, Greenwich, and Lewisham, in Kent. The *Post-office* L. is larger than the *Parliamentary* L.; and the *Police* L. is larger than either. It is usual, however, now to take, as the limit of L., the area under the operation of the 'Metropolis Local Government Act,'

which is also adopted by the Registrar-general for the Census, and which is nearly identical with the area under the control of the Metropolitan Board of Works. This area contained, in 1851, 365,923 inhabited houses, and 2,362,236 inhabitants; and in 1861, 330,237 inhabited houses, and 2,803,034 inhabitants. In round numbers, the dimensions may be estimated at about 13 miles from east to west, and 9 from north to south; but the shape is very irregular; all that can be said relates to the area, which is 117 square miles. For *Parliamentary* purposes, L. constitutes eight boroughs—viz., City of London, Westminster, Southwark, Marylebone, Finsbury, Tower Hamlets, Lambeth, and Greenwich; the first sending four members, and the others two each. The Tower Hamlets alone contained 570,899 inhabitants in 1861. For *Poor-law* purposes, L. is divided into 40 unions, in some cases single parishes, in others groups of parishes. The 'Metropolitan Buildings Act' of 1855—which gives some kind of official control over the ranging of houses in streets, the removal of projections and shells, the management of rebuilding and repairs, the compulsory repair of houses in a dangerous condition, &c.—divides the metropolis into 56 districts, of which 4 are in the City of L., 5 in the City of Westminster, 30 in other parts of the metropolis north of the Thames, and 17 south of the Thames. Each of these has a district officer and a district surveyor.

The Thames at L. is crossed by the following Bridges, now (August 1863) either built or building: London Bridge, South-eastern Railway City Bridge, Southwark Bridge, Chatham and Dover Railway Bridge, Blackfriars Bridge, Waterloo Bridge, Charter Cross Railway and Foot Bridge, Westminster Bridge, Lambeth Bridge, Vauxhall Bridge, Finsbury Railway Bridge, Chelsea Bridge, Battersea Bridge, West London Railway Bridge, Putney Bridge, and Hammersmith Bridge. (The bridges at Barnes, Kew, and Richmond can scarcely be said to be within metropolitan limits.) Near and between these bridges are about 20 *Steam-boat piers*, for the accommodation of river-passengers. The *Thames Tunnel* forms a footway under the river, 1200 feet long, about two miles below London Bridge. For the accommodation of such shipping as cannot conveniently load and unload in the river, *St Katharine's Docks*, *London Docks*, *Limehouse Dock*, *West India Docks*, *East India Docks*, and *Fleet Docks*, have been formed on the northern shore; and the *Commercial* and *Grand Surrey Docks* on the southern. The part of the Thames just below London Bridge, called the *Pool*, is the great rendezvous for coal-ships; below that, as far as Blackwall, is the *Port*, occupied by ships of greater burden. Of *Canals*, the Paddington, Regent's, and Grand Surrey are the chief.

In matters of government, L. is under very varied jurisdiction. The lord mayor and corporation exercise peculiar powers in the City, in reference to tolls, dues, markets, the administration of justice, police, drainage, lighting, paving, and a variety of other matters. The City is divided into 25 *Wards*, each represented by an alderman; the aldermen are chosen for life, and are magistrates by virtue of their office. The *Common Council* consists of 206 members, who, with the lord mayor and aldermen, form a kind of parliament for the management of City affairs. The *Mansion House* and *Guildhall* are the chief buildings for the transaction of corporate business. The *Metropolitan Commissioners of Police*, and the *Metropolitan Board of Works*, have control over the whole metropolis except the City. Westminster and Southwark are each under local authorities, but only in minor matters. The *Drainage* is managed

by two Boards of Works, one for the City, and one for the rest of the metropolis; and is now being improved by a vast and costly system of sewerage, paid for by the householders. Nearly all the drainage and sewage, after the year 1866, will enter the Thames at points 12 miles below London Bridge, instead of in London itself; the expense of the new sewers will exceed £4,000,000. The Gas supply is in the hands of joint-stock companies; and so is the Water supply: the water being obtained from the Thames, and from the New River, one of its affluents. In Police jurisdiction, the City of L. is entirely distinct from the rest of the metropolis. In 1863, an attempt was made by the government to bring all under one jurisdiction; but the opposition of the citizens was so strong, that the attempt failed. The City police, about 650 in number, are in 6 divisions, and have 7 stations; there are 2 police-offices or justice-rooms, one at the Mansion House, and one at Guildhall. All the rest of the metropolis is under the Commissioners of Metropolitan Police, with head-quarters at Whitehall. There are 18 divisions, all but one (the Thames Police) denoted by letters of the alphabet; the full force, officers and men, is about 7000. There are 15 police-offices, attended by 27 police magistrates, for taking cognizance of offences within the metropolis, but outside the City.

The Streets of L. depend mainly for their direction on the course of the Thames; the principal of them being nearly east and west. One line of route extends from Hammersmith to Mile End and Bow, through Piccadilly, Strand, and Cheapside; another, beginning in the Uxbridge Road, passes through Oxford Street and Holborn, and joins the former at Cheapside. There is still a deficiency of wide thoroughfares for the City traffic; but a new street about to be made from Blackfriars Bridge to the Mansion House will open a new and useful avenue—in connection with an important *Thames Embankment*, which is to extend from Blackfriars Bridge to Westminster Bridge, on the north bank of the river. Most of the new streets formed within the last few years are far superior in all respects to those formed fifty or a hundred years ago—except those at the outskirts, which are mostly poor and slight. Regent Street and the Quadrant form the finest street in London, for general effect; but the most palatial street is Pall-Mall, owing to the number of *Club-houses* situated there, most of which are fine buildings. Of the 50 principal club-houses in L., the *Army and Navy, Guards', University, Carlton, Reform, Travellers', Athenæum, United Service, and United University*, are in this one street. Perhaps the wealthiest range of shops in the world is that which lies on the route from Charing Cross to Cornhill.

Among the buildings in L. belonging to the crown or to the nation, the following are the principal: *St James's Palace*, an irregular and inelegant cluster of buildings, used for court purposes, but not as the Queen's residence. *Buckingham Palace*, the Queen's London residence, a large but low quadrangular mass, with very inadequate court accommodation. *Marlborough House*, lately refitted and furnished as a residence for the Prince and Princess of Wales. *Kensington Palace*, occupied not by royalty, but by recipients of court-favour. *Houses of Parliament*, a vast structure, which has cost £3,000,000; perhaps the finest, and certainly the largest, Gothic building in the world applied to civil purposes; the river-front is 900 feet long. *Westminster Hall*, a noble old structure, of which the main hall is 220 feet by 68, and 110 high. *Somerset House*, a quadrangular structure with a river-frontage of 600 feet; it is mostly occupied by government offices. The *Admiralty*, noticeable chiefly for the

screen in front of the courtyard. The *Horse Guards*, the official residence of the commander-in-chief, with an arched entrance to St James's Park. The *Treasury*, the *Home Office*, the *Privy Council Office*, and the *Board of Trade*, occupy a cluster of buildings in Whitehall. The *Foreign, Colonial, India, and Exchequer Offices* are being rebuilt. The *War Office*, in Pall-Mall, a large but plain brick building. The *British Museum* (q.v.). The *National Gallery*, one half devoted to a portion of the national pictures, and the other to the Royal Academy. The *Museum of Economic Geology*, in Jermyn Street, a small but well-planned building. The *South Kensington Museum*, a medley of buildings more remarkable for convenience than for beauty, and filled with a miscellaneous but valuable collection. The *Custom House*, with a long room 190 feet by 66, is finely situated on the river-side. The *General Post-office*, a noble mass in St Martin's-le-Grand, has a central hall 80 feet by 60, and 53 high, with a vast number of offices all around it. The *Mint*, on Tower Hill, is a cluster of buildings in which the gold and silver coinage is managed. The *Tower of London* is a confused mass of houses, towers, forts, batteries, ramparts, barracks, armouries, storehouses, and other buildings, included within a boundary of about 900 feet by 800, at the extreme eastern verge of the City.

L. is the seat of a bishopric, which comprises about 320 benefices. The income of the bishop is £10,000 a year. St Paul's is the cathedral for the diocese; it is situated at the east end of Ludgate Hill, extending to Cheapside, and was built by Sir Christopher Wren (1675–1710) at a cost of £748,000. It is built in the form of a cross, is 514 feet long, by 286 wide; the cross, which surmounts the ball over the dome, is 356 feet above the marble pavement below. St Paul's contains many monuments to illustrious persons. *Westminster Abbey*, also cruciform, is 530 feet in extreme outer length, by 203 in width; the west towers are 225 feet high. Henry VII.'s Chapel, at the east end, is a beautiful example of enriched Gothic. The Abbey has no special connection with the see of London, but is intimately connected with some of the court and parliamentary ceremonies. It was originally a Benedictine Monastery, and is said to have been founded by Sebert, king of the East Saxons (circa 616); enlarged by King Edgar and Edward the Confessor; and rebuilt, nearly as we now see it, by Henry III. and Edward I. Here the kings and queens of England have been crowned, from Edward the Confessor to Queen Victoria; and here many of them have been buried. The *Poet's Corner* is a well-known spot of the Abbey. *St Saviour's*, in Southwark, is the third in importance of the L. churches. The largest Roman Catholic Church is in St George's Fields. The largest Dissenting Chapel is Mr Spurgeon's Tabernacle. There are in L. about 850 places of worship; those open for service in the closing months of 1862 may be thus classified: Church of England, 335; do. chapels, 71; Independent, 100; Baptist, 89; Wesleyan, 104; Methodists, various, 43; Roman Catholic, 31; English Presbyterians, 11; Friends' Meeting-houses, 8; Jews' Synagogues, 10; Catholic and Apostolic (Irvingite), 6; Scotch, 7; various denominations, 36.

Of *Schools* of all kinds, there are in L. about 1200 *private*, and 600 *public*—the latter including Free, Parochial, National, and British Schools. The chief educational establishments are *King's College, University College, Gordon College, Regent's Park College, New College, Wesleyan College, Hackney College, Training Colleges* belonging to the National, British and Foreign, and Home and Colonial School Societies, *Westminster School, St Paul's School*,

LONDON.

Charter House School, Christ's Hospital, or the Blue Coat School, the Gray and Green Coat Schools, Merchant Taylors' School, Mercer's Grammar-school, City of London School, and two Ladies' Colleges.

There are about 70 almshouses in London. The societies, associations, and institutions, of a more or less permanent character, maintained for other than money-making objects, are not less than 600 in number. Of the *Hospitals*, the chief are *Guy's*, the *London*, the *Westminster*, the *Charing Cross*, *St George's*, *Middlesex*, *King's College*, *University College*, the *Small-pox*, the *Consumption*, the *Lock*, and the *Royal Free Hospitals*. *St Thomas's Hospital* (near London Bridge), owing to the extension of the South-eastern Railway, has been pulled down; it is to be rebuilt on another site. *St Luke's* and *Bethlehem* (for insane persons), and the *Foundling Hospital*, are special in their objects. Of the 600 institutions above alluded to, about 200 are hospitals, dispensaries, infirmaries, and asylums; while the remaining 400 are religious, visiting, or benevolent institutions.

There are 7 courts of equity, 3 courts of common law, 5 sheriffs' courts, and 10 county courts—besides various courts coming under other designations. There are five sessions-houses (Old Bailey, Guildhall, Clerkenwell, Westminster, and Horse-monger Lane). The prisons have undergone many changes within the last few years, partly owing to the decay of old buildings, and partly to changes in the law of imprisonment. At present, the buildings actually used as prisons are 12 in number—viz., Newgate, Holloway, Pentonville, Cold Bath Fields, Whitecross Street, Millbank, Tothill Fields, Clerkenwell, Brixton, Fulham, Horse-monger Lane, and Wandsworth. The chief buildings in L. connected with law and justice are the following: the *Westminster Hall Courts* of Law and Equity; the *Lincoln's Inn Courts* of Equity; the *Guildhall Courts*; the *Central Criminal Court* in the Old Bailey; *Eccelesiastical* and other special courts at Doctors' Commons, &c. What are called the *Inns of Court* are in some sense colleges for practitioners in the law; they comprise the *Inner Temple*, the *Middle Temple*, *Lincoln's Inn*, and *Gray's Inn*; and there are others called *Inns of Chancery*, comprising *Thavies'*, *Furnival's*, *Staple*, *Barnard's*, *Clifford's*, *Clement's*, *Lyons*, *New*, and *Serjeant's Inns*. Connected incidentally with legal matters is the *Record Office*, a large depository for official papers in Fetter Lane. The legal practitioners in L., besides judges, &c., comprise about 3900 solicitors and attorneys, and 1900 barristers.

In connection with the shipping of L., and the import and export trade, the *Docks* above-named contain 273 acres of water space, and 106,000,000 cubic feet of warehouse, shed, and vault accommodation—besides warehouses in various parts of the city, away from the docks. In 1860 (1861 and 1862 were exceptional years, owing to the disturbance of trade occasioned by the civil war in America) the number of ships that entered or left the docks was 5819, with a tonnage of 1,996,438 tons—averaging a little over 300 tons each. This almost entirely excluded the colliers; for nearly all the sailing-vessels which come to L. laden with coal, instead of entering docks to unload their cargoes, lie in the stream of the river, and transfer their coal to lighters, which convey them to the yards of coal-merchants, situated either on the banks of the river itself, or of the canals which run into it. The shipping of the port of L., in 1860, comprised 2943 vessels, of 919,591 tons burden, giving an average, as in the above-named case, of a little over 300 tons each. One-fourth of the whole tonnage of England belonged to

London. The number was made up of 2516 sailing-vessels and 527 steamers. The port of L. owned more than half the large steamers in England. Of the 29,542 ships that entered the port of L. in 1860, there were 18,365 engaged in the coasting trade, 8949 in the *foreign*, and 2628 in the *colonial*; they had an aggregate tonnage of 6,151,291 tons, and nearly all came with cargoes. About the same number of vessels left the port; but many of these, especially the coal-ships, were in ballast. With regard to *kind*, 24,204 of the total number were sailing-vessels; the rest steamers. With regard to *country*, 24,686 were British; the rest foreign. In 1860, the declared real value of all the merchandise exported from the port of L. was £30,837,680, nearly one-fourth of that of the exports for the whole United Kingdom.

The imports of wheat, flour, cotton, dye-stuffs, palm-oil, copper ore, lard, saltpetre, molasses, and alpaca, are greater into Liverpool than into L.; while Hull takes the lead in flax, flax-seed, and iron; and Southampton in silk and cochineal. But in the greater number of articles L. takes precedence; and in many of them the proportion borne to the whole imports into the United Kingdom is very remarkable. The following figures refer to 1860:

	Into London.	Into whole of United Kingdom.
Live-stock,	341,222	327,719
Coffee,	72,794,354	88,767,746 lbs
Cocoa,	6,679,631	9,009,888
Tea,	83,711,066	88,946,438
Sugar,	4,846,132	8,817,478 cwt.
Oil,	1,645,991	2,820,261 grs.
Butter,	487,942	940,119 cwt.
Cheese,	292,606	285,263
Bacon and hams,	140,226	326,105
Salt meat,	241,626	434,228
Dried fruit,	694,757	984,125
Oranges and lemons,	811,111	1,184,416 bush.
Rice,	799,322	1,884,646 cwt.
Pepper,	10,822,319	12,810,046 lbs
Mahogany,	22,890	44,716 tons.
Leather,	1,980,411	4,707,477 lbs.
Hemp and jute,	669,645	1,608,178 cwt.
Cocoa-nut oil,	187,570	194,269
Rum,	5,171,894	7,219,672 gals.
Brandy,	1,547,684	2,342,543
Wine,	8,629,382	11,723,080

The customs duties in the port of L. in that year amounted to £11,781,819.

The principal markets of L. are the *Cattle Market* at Pentonville, *Covent Garden* (vegetable) *Market*, *Billinggate* (fish) *Market*, *Newgate* and *Leadenhall* (meat and poultry) *Markets*. The establishments for wholesale dealings are, of course, stupendous in character; of coal alone, L. now requires more than 4,000,000 tons annually. The whole number of distinct trades or occupations in L. is about 2000. There are about 80 *Trade Guilds* or *City Companies* in L., many of which possess large revenues; but they do not now exert much influence on the actual course of trade and manufactures; the chief among them, called the *Trade Great Companies*, are the *Mercers'*, *Grocers'*, *Drapers'*, *Fishmongers'*, *Goldsmiths'*, *Skinner's*, *Merchant Taylors'*, *Haberdashers'*, *Salters'*, *Ironmongers'*, *Vintners'*, and *Clothworkers'* Companies, all of which have *Halls*, in which banquets are held. The *Goldsmiths'*, *Apothecaries'*, and *Stationers'* Companies still exercise some active control over those trades. The *Banks* in L., either private or joint-stock, are about 90 in number, many of which have two or more banking-houses. There are 95 *Insurance Offices*: some for life only, some for fire only, some for life and fire. The buildings for these banks and insurance offices are among the best in London. The *Bank of England*, one of Sir John Scare's most successful works, gives employment to

about 1000 clerks, &c. The *Royal Exchange* is noticeable chiefly for Sir R. Westmacott's sculpture in the pediment. The *Corn Exchange* and the *Coal Exchange* are convenient for their purposes. The *Stock Exchange*, near the Bank, is nearly hidden from view. The great warehouses for foreign and colonial produce lie chiefly eastward of the city; while the wholesale establishments for textile goods occupy enormous buildings in the neighbourhood of Cheapside and St Paul's Churchyard. Most of the large manufacturing establishments lie either eastward or southward, the centre and the west of the metropolis being engaged in selling rather than in making.

In relation to literary activity, as represented by periodicals printed and published in L., the following is an approximate estimate: L. morning newspapers, 12; L. evening newspapers, 7; L. weekly newspapers, 130; other L. newspapers, 55; periodicals of all kinds, other than newspapers, about 500. The printers, binders, publishers, and sellers of all kinds of books, newspapers, and pamphlets, comprise about 2200 L. firms.

The *Passenger and Goods Traffic* in L. requires vast resources. There are 10 railway companies, having the termini of their lines in L., besides 5 minor lines, more or less under the control of those companies. In addition to 10 large passenger-stations now open, 4 others are being constructed; while of smaller stations there are upwards of 60 north of the Thames, and 50 south of the Thames, within the limits of the metropolis. There is not at present any railway or system of railways going through the heart of L., but there are several boundary lines and links at the outskirts. The Metropolitan or Underground Railway, from Paddington to Farringdon Street, will probably make a junction with the Chatham and Dover line at the last-named point, and will thus complete a route entirely through the metropolis from north-west to south-east. The nature of the local railway traffic in L. may be illustrated by the fact, that on the Metropolitan Railway (3½ miles) there are more than 1000 trains per week, each accommodating 7 stations. There are in L. about 120 *Booking-offices* connected with inns, having relation to passenger and carrier traffic. For water-traffic, there are about 50 *wharfs* and *quays* on the Thames, besides a considerable number on the Regent's and other canals. There are about 1500 omnibuses, and 5000 cabs. It has been ascertained that, on an average day, 1000 vehicles per hour pass through Cheapside; and on an average day of 24 hours, 170,000 persons and 20,000 vehicles have been counted crossing London Bridge.

Of the open places in the metropolis, the *Parks* are the most important. *Hyde Park*, *St James's Park*, the *Green Park*, *Regent's Park*, *Victoria Park*, *Kennington Park*, and *Battersea Park*, all belong to the nation, and are purposely kept out of the builders' hands; they are most valuable as 'lungs' to London. *Primrose Hill* may be included in the number. The *Zoological Gardens*, *Horticultural Gardens*, and *Botanic Gardens* are beautiful places, belonging to private societies. The *Cemeteries*, substitutes for the old churchyards, are at Highgate, Finchley, Stoke Newington, Mile End, Kensal Green, Bethnal Green, Brompton, Colney Hatch, Camberwell, Norwood, &c. Of places of amusement, there are 2 opera-houses, about 20 theatres, 12 music-halls of large dimensions, a much larger number of smaller size, and very numerous exhibition-rooms of various kinds. Of public *Columns* and *Statues*, in open places, L. contains a smaller number than is due to its size. The chief are the following: The *Monument*, Fish Street Hill;

Nelson Column, Trafalgar Square; *Wellington Statue*, Hyde Park Corner; *Achilles Statue*, Hyde Park; *Guard's Memorial*, Pall Mall; *Crimean Monument*, Westminster; *York Column*, Waterloo Steps; *Havelock's* and *Napier's* statues, Trafalgar Square; *Peel's Statue*, Cheapside, &c. Of *Fountains*, there are scarcely any except in Trafalgar Square; but *Drinking Fountains* are becoming very numerous. There are about 60 *Baths* in L., of which 12 are cheap *Public Baths and Wash-houses*.

[Unless otherwise mentioned, the figures in this article refer to the close of the year 1862.]

LONDON, chief city of the county of Middlesex, Canada West, is situated at the junction of the two branches of the river Thames, about 114 miles west-south-west from Toronto, with which it is connected by the Great Western Railway. The situation, whose fitness for a town was recognised by General Simcoe as early as 1784, only began to be cleared and laid out in 1825; but such has been the rapidity of the city's growth, that, in 1852, the population had risen to 7124; in 1867, to 16,000; and although it had fallen at the census of 1861 to 11,555, it is now again on the increase. When the city was called L., the river, which had formerly been known by an Indian name, received that which it now bears, a Westminster and a Blackfriars Bridge were thrown over it; and the names given to the principal streets and localities, still seem to indicate a desire to make the westernmost city of Canada a reproduction, as far as possible, of the capital of England. The Thames will probably be made navigable as far as L., to give it a communication by water with the lakes, and it has already an outlet by railway to every part of the American continent. The centre of a rich agricultural district, L. carries on a large trade in the produce of the country, while there are also 2 foundries, 2 tanneries, 2 breweries, 6 printing-offices, issuing as many newspapers; and several other branches of manufacture are conducted on a similar scale. In 1861, the value of the exports was £78,000; of the imports, £176,400; and the amount of duties collected, £29,188 sterling.

LONDON, CUSTOM or, in English Law, is peculiar in several respects, and the laws there differ in those respects from the rest of the country. Thus, in the City (and by the City is meant only the City proper, or a small portion of the metropolis), a law of foreign attachment exists, which resembles the Scotch law of arrestment, by which a creditor may attach or seize the goods or debts of his debtor, in the hands of third parties, to abide the result of an action to be brought. The City of London also had a custom until recently which resembled the Scotch law of *Legitim* (q. v.) and *Jus Relictæ* (q. v.), by which a person at death could not by will disinherit his children, or leave his wife destitute. This custom was abolished by the stat. 19 and 20 Vict. c. 94. There is also a peculiar custom by which the common council elect their own sheriffs, instead of the crown electing them. There are also several other customs relating to local offences of minor importance.

LONDON CLAY, or LOWER EOCENE STRATA (q. v.), are a series of beds occupying the lower basin of the Thames from Hungerford to Harwich and Herne Bay; and also an extensive triangular region in Hampshire and the neighbouring counties, whose base extends along the coast from Dorchester nearly to Brighton, while its apex reaches to Salisbury. The beds are arranged in three sections: London Clay Proper and Bognor Beds, maximum thickness, 480 feet; Plastic and Mottled Clays and Sands, maximum thickness, 160

feet; Thanet Sands, maximum thickness, 90 feet: total, 730 feet.

The London Clay Proper consists of tenacious dark-gray and brown clay, with layers of septaria, which occur in sufficient quantity in the beds near Harwich and along the coast of Harwich to be used for the manufacture of Roman cement. In Hampshire, the clays are bluish, and have running through them bands of sand, sometimes compacted into hard stone, called Bognor Rock. In both basins, the clay rests on a thin bed of variously coloured sand and flint pebbles. The London Clay is rich in fossils. Many palm and other fruits have been described by Bowerbank from the island of Sheppey: masses of wood, often bored by the teredo, are not unfrequent. The mollusca belong to genera which now inhabit warmer seas than those of Britain, such as cones, volutes, nautilus, &c. About fifty species of fish have been described by Agassiz from Sheppey, among which are a sword-fish and a saw-fish. The remains of several birds and pachydermatous animals tell of the neighbourhood of land; and the numerous turtles, with the crocodiles and gavials, whose remains are associated with them, no doubt infested the banks of the great river which floated down the Sheppey fruits.

The Plastic Clays, or Woolwich and Reading series of Prestwich, are very variable in character, consisting chiefly of clays and argillaceous sands, which are used, as their name implies, in the manufacture of pottery. They contain a mixture of marine and fresh-water shells, shewing that they have been deposited in estuaries. They attain their maximum thickness of 90 feet in the Isle of Thanet, and thin out westward, till at Windsor they are only four feet thick—beyond this, they entirely disappear.

LONDON CONFERENCES. The first diplomatic meeting so designated was held in 1826 and the following years, for the regulation of the affairs of Greece; the next one was held in 1830, to arrange terms of agreement or of separation between Belgium and Holland. The terms of agreement proposed not being accepted by the disputants, Holland made an appeal to arms; but the capture of Antwerp by the French, and the blockade of their coast by the English and French fleets, brought the Dutch to agree to a treaty of definitive separation, 21st May 1833. A third conference was held in 1840, on the Turko-Egyptian question, in which France refused to take part. In 1851, a protocol was signed in London by the representatives of all the Great Powers, declaring the indivisibility of the Danish monarchy (inclusive of Slesvig and Holstein).

LONDON UNIVERSITY. When University College, London, was first established (in 1825), it was known as L. U., although a mere joint-stock undertaking. A change took place in 1836, when it received a charter as *University College*. At the same time, by another charter, L. U. was established—not a building for teaching, nor a body of teachers and scholars, but a body of persons empowered to examine candidates and confer degrees. As this second charter was only valid during 'royal will and pleasure,' it required to be renewed at the death of William IV., and the accession of Victoria; and a new charter was accordingly granted, December 5, 1837. Additional powers were given, July 7, 1850; and a wholly new charter was signed April 9, 1858, instituting many changes in the functions and arrangements of London University. *University College, London*, is still carried on in Gower Street, the original spot; but the *University of London*, or L. U., occupies apartments

granted by the government in Burlington House. The body consists virtually of a Chancellor, Vice-chancellor, 36 Fellows, and an indefinite number of Graduates. The *Chancellor* is appointed for life, or during royal pleasure, by the crown. The *Vice-chancellor* was named by the crown in the new charter of 1858, but is since annually elected by the Fellows from among their own body. The 36 *Fellows* were named by the crown in that charter, for life; but as vacancies occur, the crown and the university fill them up in a mode that gives some control to each. The *Graduates* are those who, at any time since 1836, have had degrees (*Bachelor, Master, or Doctor* of certain faculties) conferred upon them by this university. The *Senate* is composed of the Chancellor, Vice-chancellor, and Fellows, and has the power of making the whole of the by-laws for the government of the university—within certain limits prescribed by the charter, and with the approval of the Secretary of State. The *Convocation* is composed of all the graduates, except those who have taken the lower degrees only a few months; it meets occasionally, to vote and decide upon several minor matters, such as do not touch upon the higher functions intrusted to the senate. It gives the graduates a certain *esprit de corps*; but the charter seems to confine all real power to the senate.

When the new charter was given, in 1858, there were 47 colleges and collegiate schools in connection with L. U.—two in the colonies, and the rest in the United Kingdom. The number has since been considerably increased. The Secretary of State and the senate have the power of deciding what additional establishments shall be included. All these are regarded as *schools*, at which youths have gone through a good course of education; and certificated scholars from these schools may go up to L. U. to be examined, as a preliminary to the attainment of degrees. *Examiners* for this purpose are appointed by the senate, which also defines the extent and mode of examination. By the charter of the university, theology is entirely excluded. The degrees obtainable are those of *Bachelor* and *Master* of Arts, *Bachelor* and *Doctor* of Medicine, *Bachelor* and *Doctor* of Laws, and (since 1859) *Bachelor* and *Doctor* of Science. In each faculty, the degree of Doctor (or Master) is the result of a second and higher examination of those who are already Bachelors. Students also, under defined conditions, can try for *certificates of competency*, independent of degrees, which certificates are an important aid during the competitive examinations now adopted in reference to the public service.

From a 'Return of the General Fee Fund' of the L. U. presented to parliament in 1863, it appears that in the year April 1862—March 1863, the university received about £8500, of which £5000 was the annual grant from parliament, and £3500 fees. Of this income, about £5500 was paid in salaries, and £2000 in exhibitions, scholarships, medals, and prizes.

LONDONDERRY, ROBERT STEWART, second MARQUIS OF, born at Mount Stewart, Down County, Ireland, June 18, 1769, eldest son of Robert, first marquis, who represented the county of Down many years in the Irish parliament. Educated at the Grammar-school, Armagh, and at St John's College, Cambridge, he entered the Irish parliament in 1789, although then under age. In 1796 he became Viscount Castlereagh; and in 1798 he was made Chief Secretary for Ireland. It was the year of the insurrection and the French invasion, and some allowance must be made for the terrible

severities employed by the Irish government. Yet in the cruel part he acted or tolerated in Ireland, in the suppression of the rebellion, and effecting the union, always weighed upon his reputation. In 1802, he was appointed President of the Board of Control, in the Addington administration. In 1805, he was promoted to the seals of the War and Colonial department, but resigned, with the whole of the cabinet, on Pitt's death in 1806. In the following year, he resumed the office of War Minister, when he organised the disastrous Walcheren expedition. Mr Canning, then Foreign Secretary, attacked Lord Castlereagh on this account with much acrimony and personality. The result was that both resigned, and a hostile meeting took place between them (21st September 1809), in which Canning was wounded. In 1812, after the assassination of Mr Perceval, Lord Castlereagh became Foreign Secretary, a post which he held during the period illustrated by the military achievements of the Duke of Wellington. By this time the general direction of British policy was unalterably fixed by circumstances, and Lord Castlereagh has at least the merit of having pursued this fixed course with a steadiness, and even obstinacy, which nothing could abate. He was the soul of the coalition against Bonaparte, and it was only by his untiring exertions, and through his personal influence, that it was kept together. He represented England at the Congress of Vienna in 1814, at the treaty of Paris in 1815, and at the Congress of Aix-la-Chapelle in 1818. While his foreign policy was favourable to the principles and policy of the 'Holy Alliance' abroad, he constantly recommended arbitrary and despotic measures at home. As the leader of the Liverpool government in the Lower House, he carried the suspension of the Habeas Corpus Act in 1817, and the 'Six Acts,' or 'the Gagging Bills,' as they were called, of 1819—measures which will for ever stamp his name with infamy. The retirement of Canning from the ministry, rather than be a party to the prosecution of Queen Caroline (1820), threw the whole weight of business on Lord Castlereagh. By the death of his father in 1821, he became Marquis of Londonderry; but his mind became deranged, and he died, by his own hand, at his seat at Foot's Cray, Kent, August 12, 1822. The populace witnessed the funeral procession in silence; but when the coffin entered the walls of Westminster, a loud and exulting shout rent the air, which penetrated into the abbey, and broke upon the stillness of the funeral ceremony. This statesman, looked upon by one party as a paragon of perfection, has been characterised by the other party as 'the most intolerable mischief that ever was cast by an angry Providence on a helpless people.'

LONDONDERRY, a maritime county of the province of Ulster, in Ireland, 40 miles in length by 34 in breadth, bounded N. by the Atlantic, E. by the county Antrim, and in part by Lough Neagh, S. by Tyrone, and W. by Donegal. Its area is 810 square miles, or 522,350 acres, of which 318,282 are arable. The population in 1861 was 184,137, of whom 83,428 were Catholics, 30,871 Protestants of the Established Church, 66,014 Presbyterians, and the rest Protestants of other denominations. The surface of L. is irregular. From the eastern boundary, it rises gradually towards the west, for a distance of about 10 miles, where commences an elevated district, rising in several points to a considerable height; Sawell, on the southern border, being 2236 feet high. On the western side, the surface falls gradually towards Lough Foyle. The coast-line along the Atlantic is generally bold and precipitous. The shore of Lough Foyle is in most places an unvarying

plain. The county may be divided longitudinally into two great geological districts, separated from each other by the river Roe. In the western, which is mountainous, the mica-slate prevails, accompanied in some places by primitive limestone. In the eastern, the mica-slate is overlaid by a succession of varying beds, capped, as in the adjacent Antrim district beyond the Bann, by a vast area of basalt, the dip of which, however, is the reverse of that on the opposite side of the river, and increasing in thickness towards the north, where in one place it reaches a depth of 900 feet. Many of the strata contain iron, and the ironstone of the mountain called Slieve Gallion was formerly worked, but the mining operations have been abandoned, from the failure of fuel. The soil is of a very mixed character, the greater part, with the exception of the alluvial spots on the banks of the several rivers, and of a considerable open district which stretches southward to Tyrone, being ill suited for wheat, or indeed for any cereal crop. In the year 1862, 197,239 acres were under crops of all kinds. The number of cattle was 93,902; of sheep, 26,285; of pigs, 28,214. The total value of live-stock, in 1851, was £817,108. The system of agriculture has been materially improved under the impulse given by the London society upon the large estates which it holds in the county. The principal rivers are the Foyle, the Faughan, the Roe, and the Bann. The first is navigable as far as L. for ships of 800 tons burden. The Bann, besides being a great source of motive-power for the staple manufacture of Ulster, that of linen, is also celebrated for its salmon-fisheries, which are of great value. The chief towns are Londonderry City (q. v.), Coleraine, Newtown-Limavady, and Magherafelt. L. was in ancient times the seat of the great sept of O'Loughlin and O'Neill, and of their tributary sept of O'Cahan, or O'Kane. At the immediate period of the invasion, the English, under John de Courcy, attempted a settlement, but were forced by the O'Neills to withdraw. A small garrison within their colony was established near the Antrim border, at Coleraine, upon the river Bann; but from the 14th till the 16th c., their tenure was little more than nominal; and although a number of forts, with a considerable garrison, were erected upon the river Foyle in 1600, it was not till the flight of the celebrated Tyrone and O'Donnell that the English occupation of the district was consummated, their forfeited lands being granted by the crown to the corporation of London, who still retain them, the management being vested in a body, 26 in number, who are elected by the common council, one half retiring each year. The incorporation, by charter, of this body, in 1619, led to the formation of the county, called, from this circumstance, Londonderry. Portions of the county were assigned to the several city companies, the unassigned portions being held by the society. The memory of the confiscation long rankled, and perhaps still lingers, in the minds of the dispossessed Irish and their descendants; but in material prosperity the district underwent a rapid and marked improvement. The agriculture is in a condition considerably in advance of the majority of Irish counties, and the domestic manufacture of linen, in former times, added materially to the comfort of the population. Of late years, however, this manufacture, in all its branches, has been transferred for the most part to large establishments. There is considerable export and import trade at the ports of Derry and Portrush, which is the seaport of Coleraine. The former has become a port of call for the Canadian steamers, which touch on their outward and homeward passage at the entrance of Lough Foyle. The number of national schools in

L., in the year 1861, was 388, attended by 20,696 pupils, of whom 11,439 were males, 9257 females. L. returns two members to the imperial parliament.

LONDONDERRY, CITY OF, a seaport, and a corporate and parliamentary borough, capital of the above county, situated on the river Foyle, and distant from Dublin 144 miles, north-north-west. Pop., in 1861, 20,493; of whom 11,954 were Roman Catholics, 4498 Presbyterians, 1538 Protestants of the Established Church, and the rest Protestants of other denominations. It returns one member to parliament. L. arose under the shadow of a monastery founded here in the 6th c. by St Columba. It was pillaged more than once by the Danes, and was occupied, but with many vicissitudes, by the English at the invasion. The town formed part of the escheated territory granted to the London companies, and under their management the city arose to some importance, and was strongly fortified. In the Irish war of the Revolution, L. threw itself earnestly into the cause of William of Orange, and closed its gates against James II. The siege of L. is one of the most celebrated events in modern Irish history, and its memories are among the most stirring of the occasions of party animosity. Since that date, the city has steadily grown in extent and prosperity. It is beautifully situated on the left bank of the Foyle, upon a hill which overlooks the river. The walls are still preserved, and form an agreeable promenade. The left bank of the river is connected by a wooden bridge (in part a draw-bridge) more than 1000 feet in length, with an extensive suburb called Waterside. The cathedral dates from 1633. A handsome Roman Catholic cathedral has been recently erected. The court-house also is a building of some pretensions, and the historical events above alluded to are commemorated by a triumphal arch erected in 1789, and a column erected in honour of the Rev. George Walker, who was governor of the city during the memorable defence, of which he was himself the great organiser and inspirer. There are several important educational foundations, one of which, Gwyn's School, has an income of £1870. Most of the foundations are due to the London companies. The arrangements and appliances of the port are on a good scale. Vessels of 500 tons can discharge at the quays, and there is a patent slip capable of receiving vessels of 800 tons. Steamers ply to Liverpool, Glasgow, and Belfast; and there is railway communication with Dublin and Belfast, as well as a considerable advance towards direct communication with the western coast. The custom-duties of the port amounted, in 1852, to £116,799. The chief manufactures are flax-spinning, distilling, brewing, rope-making, and tanning. There is also an extensive salmon-fishery.

LONG, GEORGE, M.A., a distinguished classical scholar, was born at Poulton, in Lancashire, in 1800, educated at Trinity College, Cambridge, where he obtained the Craven scholarship in 1821. L. became Chancellor's Medallist in 1822, and subsequently fellow of his college. In 1824, he accepted the Professorship of Ancient Languages in the university of Virginia, United States; but returned to England in 1826, to become Professor of the Greek Language and Literature in the London University. This office he resigned in 1831, when he commenced to edit the *Journal of Education*, published by the Society for the Diffusion of Useful Knowledge; but probably the greatest labour—the *magnum opus*—of his life was his editing for eleven years (from 1832 to 1843) the *Penny Cyclopædia*, to which he was also one of the most valuable contributors. At the conclusion of the 27th volume,

honourable mention is made by the Society, and by the publisher, Mr Charles Knight, of L., 'by whose learning, unwearied diligence, and watchfulness, unity of plan has been maintained during eleven years, and error, as far as possible, avoided.' In the midst of these arduous duties, L. joined the Inner Temple, and was called to the bar in 1837. In 1846, he was chosen by the Benchers of the Middle Temple to deliver a three years' course of lectures on jurisprudence and civil law. In 1848, he became Professor of Classical Literature in the Proprietary College at Brighton. L. is one of the best classical editors that England has produced; he is also one of the first authorities on Roman law. His merits as a translator are no less great, as evinced in his *Selections from Plutarch's Lives*, published under the title of *Civil Wars of Rome*. L. has contributed extensively to Smith's Classical Dictionary; and besides editions of Cicero's *Orations*, and Caesar's *Gaulic War*, he has published an *Analysis of Herodotus*, *France and its Revolutions*, and other works.

LONG, LOCH, a well-known loch in the west of Scotland, extends northward from the Firth of Clyde for about 24 miles, between the counties of Argyre and Dumbarton. It has an average breadth of about a mile; and its banks, consisting, for the most part, of steep acclivities, abound in striking and picturesque scenery.

LONG-BOAT, a strong and seaworthy boat, formerly the largest carried by a ship, but now generally superseded by the Launch (q. v.).

LONG ISLAND, an island which forms three counties of the state of New York, United States of America, between lat. 40° 33'—41° 6' N., and long. 72°—74° 2' W., bounded N. by Long Island Sound, E. and S. by the Atlantic Ocean, and W. by the bay and harbour of New York. It is 140 miles long, and 12 miles in average width, with an area of 1682 square miles. On its south shore is a bay 100 miles long, and from 2 to 5 miles wide, separated from the ocean by a narrow beach of sand, with several inlets. On this shore are several light-houses, and 30 life-boat stations. A line of hills runs along the northern portion of the island, but the centre is a plain, sloping to the sea. Villages, watering-places, and fertile farms line the coast, but the interior is mostly waste land and forest. The principal towns are Brooklyn (opposite New York), Flushing, Jamaica. The shores are lined with watering-places for summer resort. This island was once inhabited by 13 Indian tribes. August 22, 1776, Sir Henry Clinton landed on L. I. with 9000 British troops, defeated General Putnam, and compelled Washington to evacuate the island. Pop. about 400,000.

LONG ISLAND SOUND, a body of water between Long Island and New York and Connecticut, United States of America, 110 miles long, and from 2 to 20 miles wide, commencing narrow at New York City, which it separates from Brooklyn, and where it is called East River, and opening at its eastern extremity into the Atlantic Ocean, by a passage called 'the Race.' It is navigated by an immense number of coasting-vessels and steamers, and is strongly fortified at Throgs Point near New York. It receives the Connecticut, Naugatuck, Thames, and Mystic rivers on its northern shore.

LONG VACATION, a period of the year in England when suits cannot be carried on, but are for some purposes suspended—viz., from 10th August to 24th October at common law, and to 28th October in Chancery in every year. Hence it is called the lawyer's holiday.

LONGAN (*Nephelium Longum*), one of the finest of fruits, of the same genus with the Litchi (q. v.), but reckoned superior to it. The tree which produces it is a native of China, and of other eastern countries, at least as far west as the mountainous regions on the eastern frontier of Bengal. It is much cultivated in China. The leaves are pinnate, with few leaflets, the leaflets oblong, the flowers in the panicles. The fruit is globose, or nearly so. It is imported into Britain in a dried state. It has been produced in Britain by the aid of artificial heat.

LONGFELLOW, HENRY WADSWORTH, an American poet, was born at Portland, Maine, on February 27, 1807. At the age of 14, he entered Bowdoin College, Brunswick, and graduated there with high honours in 1825. For a short time he studied law in his father's office; but a professorship of modern languages having been founded in the Bowdoin College, and offered him, he accepted it, and proceeded to Europe to qualify himself for the discharge of his new duties. He returned to America in 1829, and entered upon his professorial work. His first substantive work, *Outre Mer*, appeared in 1835; and in the same year he was appointed to the chair of Modern Languages and Literature at Harvard University. He again spent a year in Europe, and made himself acquainted with the Danish and other northern literatures—an acquaintance which he has turned to noble account. In 1839, he published *Hyperion*, a prose romance, and *The Voices of the Night*; *Ballads and other Poems*, in 1841; *Poems on Slavery*, in 1842; *The Spanish Student*, in 1843; his *Poets and Poetry of Europe*, in 1845; *Belfry of Bruges*, and other poems, 1846; *Evangeline*, in 1847; *Kavanaugh*, in 1849; *The Seaside and the Preside*, in 1850; *The Golden Legend*, in 1851; *Hiawatha*, in 1855; and *Miles Standish*, in 1858.

Of the American poets, L. is the most popular in England, and, at the same time, he is the most national. If his countrymen have not a national epic, *Evangeline* or *Hiawatha* is as yet the nearest approach to it. Some of his shorter lyrics are almost perfect in idea and expression, and are to be found in every book of poetical extracts. His poetry is somewhat deficient in force, but it is full of picturesqueness; and a certain quaintness of fancy is one of its most delightful attributes.

LONGFORD, an inland county of the province of Leinster, Ireland, lying between Leitrim and Cavan on the N., Westmeath on the E. and Sligo and Roscommon on the W.; 29 miles long from north to south, and 22 miles from east to west. Its area is 269,409 acres, of which 191,823 are arable; population in 1861, 71,592, of whom 64,910 are Roman Catholics, 6114 Protestants of the Established Church, the rest Protestants of other denominations. The surface is for the most part moist and flat, with the exception of a slightly elevated central range, the greatest elevation of which is only 912 feet. Many small lakes pervade the county, and the river Shannon, or its various lakes, connect L. with the county and city of Limerick. Its navigation is also connected with Dublin by the Royal Canal; and the Midland Western Railway has a branch from Mullingar traversing the county. The south of the county forms part of the central limestone district of Ireland. The north is a continuation of the clay-slate which prevails in Cavan, the two districts being separated by a belt of yellow sandstone and conglomerate, which projects from the east of Leitrim. Deep beds of marl are found in many of the boggy districts. Marble of good quality

is also found, and ironstone, with coal, shale, and lead, of good quality, but not in remunerative quantity. The limestone district of the south is suited to tillage, and produces excellent wheat. The north is chiefly devoted to pasture. The number of acres under crop in 1862 was 82,260. In the same year, there were 43,926 cattle, 28,638 sheep, and 13,775 pigs. The chief towns are **LONGFORD** (q. v.), Granard, and Ballymahon. L. returns two members to parliament. The number of national schools, in 1861, was 88, attended by 10,392 pupils, of whom 5575 were males, 4817 females. L. anciently formed part of the kingdom of Meath, and as such was included in Henry II.'s grant to Hugh de Lacy. It was erected into a county in 1584, but in the rebellion of 1641 it was recovered for a brief period by the O'Farrells, and, on the suppression of this rising, almost the entire county was distributed, as confiscated lands, to a new race of colonists. The antiquities, although not striking, are of much interest. The islands of Lough Ree are especially rich in monastic remains.

LONGFORD, capital of the above county, 75 miles west-north-west from Dublin by the Midland Western Railway, on a small river called the Camlin. Pop. (1861) 4535, of whom 3906 were Roman Catholics, 508 Protestants of the established church, and the rest Protestants of other denominations. It is a well-built town. The Roman Catholic cathedral, recently erected, is a very spacious, and indeed a magnificent building, of the Ionic order. The chief commerce of L. is in the agricultural produce of the district. No manufacture of any importance exists in the town. It is connected with Dublin and with Sligo by the Midland Western Railway, as also with the former by the Royal Canal.

LONGICORNES, a family of tetramerus coleoptera, containing a vast number of species, among which are many of the largest and most splendid beetles. They are remarkable for the length of their slender antennae, which are often longer than the body. They all feed on vegetable food, some on leaves, some on roots, and are mostly inhabitants of forests; the females depositing their

Longicornes:

1, *Cerambyx hirtipes*; 2, *Trachyderes nigrofasciatus*.

eggs, by means of a long, strong, horny ovipositor, beneath the bark of trees, on the wood of which the larvæ feed. The L. abound chiefly in warm countries, and particularly in South America; the number of British species, however, is considerable, but some of these so reckoned have probably been imported from foreign countries in the larvæ state, in timber, to which they often do great injury.

LONGINUS, DIONYSIUS CASSIUS, a Platonic philosopher and famous rhetorician, was born, according to some, at Emesa, in Syria, and according to others, at Athens, about 213 A.D. In his earlier years, he travelled a great deal in the

company of his parents, and made the acquaintance of many celebrated scholars and philosophers. He studied Greek literature at Alexandria, where he was for a considerable time the pupil of Ammonius and Origen, and subsequently settled as a teacher of rhetoric in Athens, where he soon acquired a great reputation. His knowledge was immense: he was called 'a living library' and a 'walking museum,' but his taste and critical acuteness were no less wonderful. He was probably the best critic of all antiquity. In an age when Platonism was giving place to the semi-oriental mysticism and dreams of Neo-Platonism, L. stands out conspicuous as a genuine disciple of the great master. Clear, calm, rational, yet lofty, he despised the fantastic speculations of Plotinus, who consequently would not admit that L. was a philosopher, but—since he stooped to criticise the diction and style of Plato—pronounced him a mere philologist. In the latter years of his life, he accepted the invitation of Zenobia to undertake the education of her children at Palmyra; but becoming also her prime political adviser, he was beheaded as a traitor, by command of the Emperor Aurelian, 273 A.D. L. was a heathen, but a generous and tolerant heathen. Of his works, the only one extant (and even that one only in part) is a treatise, *Peri Hypocous* (On the Sublime). There are many editions of L.'s treatise, of which those by Morus (Leip. 1769), Toupius (Oxf. 1778, 2d ed. 1789, 3d ed. 1806), Weiske (Leip. 1809), and Egger (Paris, 1837), are among the best. See also Rhunken's *Dissertatio de Vita et Scriptis Longini*.

LONGIPENNES, in Cuvier's ornithological system, that section of the order *Palmipedes* characterised by long wings and great power of flight. The wings are often very narrow. They are all sea-birds, and many of them venture to a great distance from shore. Their hind-toe is small and free, or wanting. They cannot dive and pursue their prey under water, but they swim well, and their movements in the air are very graceful. Petrels, shearwaters, gulls, terns, noddies, skimmers, and albatrosses, are examples.

LONGIROSTRES, a tribe of birds of the order *Grallæ*, having generally a long, slender, feeble bill, and inhabiting sea-shores and marshy places, where they seek worms and other food in the mud or ooze. To this tribe belong snipes, woodcocks, curlews, godwits, sandpipers, &c.

LONGITUDE. See **LATITUDE**.

LONGIGO, a town of the Italian states, in the province of Vicenza, situated in a valley 12 miles south-west of the city of that name. It is protected by three strong towers, the antiquity of which is attested by the inscription they bear. The inhabitants, 6786 in number, are chiefly devoted to agricultural and commercial industry.

LONS-LE-SAULNIER, a town of Eastern France, in the département of the Jura, at the confluence of the Saône, Vallière, and Solman, about 55 miles south-east of Dijon. It is situated in a beautiful valley, surrounded by vine-clad hills, and was founded as long ago as the 4th c., when its salt-springs were discovered, from which 20,000 quintals of salt are yearly extracted. Pop. 9456. Rouget de Lisle, the composer of the *Marseillaise*, was born here.

LOO-CHOO, more accurately, **LU-TCHU**, the Chinese name of a group of islands, 92 in number, called by the natives *Liêu-Khiêu*, situated in the Pacific Ocean, between Formosa and Japan, and about 400 miles off the coast of China, lat. 24°—29° N., long. 127°—129° E. The largest and most

southern, called Great Lu-tchu, or Okinawu, is about 65 miles long and 13 broad. Its shores have a beautiful appearance; fields and forests are clothed with a living green, pine-woods crown the summits of the hills, and gardens and cornfields adorn the slopes. In loveliness and variety of landscape, as in the careful attention paid to agriculture, especially in the southern part of Great Lu-tchu, which looks like one vast enchanting garden, few places anywhere could surpass these islands. The principal products of the group are rice, millet, sugar, cotton, tobacco, indigo, and tea; of less importance, bananas, pine-apples, oranges, peaches, and plums. Domestic animals are very numerous—ducks, geese, swine, goats, cattle, and horses. The chief minerals are iron, coal, and sulphur, probably also copper and tin. Sugar, and a liquor called *saki*, distilled from rice, are exported to Japan. The manufacturing industry of the inhabitants is as great as the agricultural. They make paper, cloths, coarse linens, earthen and lacerated wares, bricks, tobacco-pipes, and baskets.

The people appear to be a mixture of Japanese and Chinese, the former greatly predominating, although the literature and customs of the islanders are Chinese. The population is dense; but its number has not been ascertained. Their religion is a mixture of the doctrines and practices of Confucius with those of Buddha. The government, as in China, appears to be in the hands of an aristocracy of learned men; and the king is said to be related to the imperial family of Japan. The natives pay tribute to both China and Japan. Since 1851, a Christian mission has existed here, founded by Dr Bettelheim, a German physician, who has introduced vaccination.

LOODIA'NA, a district of British India, is separated by the Sutlej from the Julinder Doab, the most easterly section of the Punjab. It lies in the 77th degree of E. long., extending in N. lat. from 30° 34' to 31° 2'; and, with an area of less than 750 square miles, it is said to contain 121,000 adult males—surely an exaggeration of the truth.

LOODIA'NA, the capital of a district of the same name in British India, takes its name from the Lodi tribe of Afghans, and is situated 1102 miles north-west of Calcutta, in lat. 30° 55' N., and long. 75° 54' E. It stands on a navigable nullah or stream, which joins the Sutlej from the east, about 15 miles below the town. It contains about 20,000 inhabitants, mostly weavers. The principal manufactures are cotton-cloth and Cashmere shawls, the latter, however, being decidedly inferior in quality to those made in Cashmere itself. Situated on the high-road between Delhi and the Punjab, L. is a military station of some importance.

LOOF, the after-part of a ship's bow, or that portion where the planks incurvate towards the cut-water. The guns mounted in this portion of the vessel are styled 'loof-pieces.'

LOOKING-GLASS. See **MIRROR**.

LOOM, the machine by which weaving is effected. The art of weaving is coeval with civilisation, therefore the loom may be reckoned amongst the earliest of man's inventions; yet, notwithstanding its vast age, very little improvement was effected in it until the invention of Dr Cartwright in 1787, who, without ever having seen a loom in his life before, constructed one to work by machine-power. In its simplest form, the loom is worked by hand; and notwithstanding the wonderful improvements which have been effected in the power-loom since its invention, there are still many fabrics manufactured by hand-looms in this and other countries.

In India, which most probably is the native country of the loom, and where silks of almost

unrivalled beauty are made, the natives continue to use this machine in its most primitive form; two trees growing near together form their standing frame, and a few pieces of bamboo, together with some pieces of string, furnish all they want besides.

As the use of the loom will be fully explained in the article WEAVING, the construction only will be given here; but it is necessary, in order to make this clear, to explain the principle of weaving, in order to shew the work the loom has to do. In its simplest sense, weaving consists in passing one set of threads transversely through another set, divided into two series, working alternately up and down, so as to receive the transverse threads in passing, and interlock them, forming thereby a united surface out of the threads. The loom is made to assist the weaver in this operation after the manner shewn in fig. 1: AAAAA is the frame of the loom, and is of no other use than to hold the working-parts in their proper position. The native of India supplies this usually by selecting, as before stated, two near-growing tree-stems, usually palms, in consequence of their straightness; these, with

two equal sets by raising up every alternate one, and inserting between them a smooth rod of wood,

A ~

Fig. 3.

to prevent them entangling or returning to their former position. This separation takes place before the final fixing of the ends of the threads to the cloth-beam, because, previous to that, each thread must be passed through a small loop in a perpendicular thread called the heald, which hangs down from the rod A in fig. 3 (in which only six heald-threads and six warp-threads are shewn, for the sake of rendering the action clearer). There are always two sets of healds in the simplest form of loom, often many more; and in the case of plain weaving, the threads of the warp are divided alternately by the loops of each heald, so that if one heald is raised, it lifts every alternate thread of the warp, and if the other is depressed, it pulls down the opposite set of threads; thus, in fig. 3, the three threads of the warp are seen to pass through the three upraised threads of one heald by the loops a, a, a, and the three remaining threads of the warp pass through the depressed healds by their loops b, b, b; the united action of the two healds opens a space between the two sets of warp-threads similar to that shewn in fig. 4. This space is called the shed, and through it is thrown the shuttle which carries the thread of the weft; when the weft has passed through, the healds are reversed, and the lower warp-threads now become the upper ones. The threads, after each intersection, are driven up tight by the reed, which is a

narrow frame with transverse wires set sufficiently far apart for a single thread of warp to pass through each; it hangs to the frame called the batten, fig. 1, D. The movement of the batten is produced by

Fig. 4.

the hand of the weaver, whilst that of the healds is readily effected by the treadles E.

Many improvements have been made in this the simplest form of loom, but the chief has been in replacing the weaver's hand in the necessary operation of throwing the shuttle by a mechanical arrangement. Without this, the power-loom would not have succeeded. The shuttle (fig. 5) is usually made of box or some other hard wood; and the blunt points are covered with iron. Formerly, when used entirely by the hand, it was made much lighter and smaller than at present. Those now in use are

Fig. 1.

four stakes to support his warp, and two or three pegs to fix his heald-ropes, complete his arrangements.

At each end of the frame, two rollers are placed, B, C, so that they will readily turn on their axes; and from one to the other, the threads of the warp are attached, and kept tight by the weights b, b. The warp-threads are wound round the roller B, which

Fig. 2.

is called the beam or yarn-roll, only as much of each thread being left unwound as will reach to the other roller, C, which is the cloth-beam, to which the ends are fastened, and upon which the cloth is wound as it is woven. The warp so stretched is seen in fig. 2.

The next step is to divide the warp-thread into

about a foot in length, and rather more than an inch square in the middle. The middle part is hollowed out into a small box, open on the upper

Fig. 5.

side. In this box the bobbin, on which the yarn or thread is wound, is placed, with its two ends on pivots, admitting of its being turned by the slightest strain on the yarn; the end of the yarn passes through a hole in the side of the shuttle, as seen in fig. 5; and as it is thrown backwards and forwards, the thread unwinds from the enclosed bobbin, and easily runs through the hole.

In the improved looms for power, and even in those still worked by hand, in special cases the

generally laid stepwise, as in the figure, although other forms are frequently resorted to. The lines in the diagram are intended to shew how large a proportion of the hostile shots would prove fruitless against the sharp-shooters within.

LOPE-DI-VEGA. See **VEGA**.

LOPHIADÆ. See **ANGLER**.

LOPHOBANCHII, an order of osseous fishes, having the ultimate divisions of the gills not pectinated, but arranged in small tufts in pairs along the branchial arches. There is nothing like this in any other fishes. The fishes of this order are few, mostly of small size, angular form, and peculiar aspect. See **HIPPOCAMPUS** and **PYX-VIAN**. The gill-cover is large, and the gill-opening is a small hole. The snout is elongated and tubular.

LOQUAT (*Eriobotrya Japonica*), an extensive Chinese and Japanese fruit, of the natural order **ROSACEÆ**, sub-order **Roseæ**, and of a genus closely allied to *Mespilus* (Medlar). It has been introduced into Australia, and is now abundant there, and is sold in large quantities, and at a cheap rate, in the markets of Sydney and other towns. The tree or shrub which produces it attains a height of 20 or 30 feet, but in cultivation is seldom allowed to exceed 12 feet. It is a beautiful evergreen, with large oblong wrinkled leaves, and white flowers in terminal woolly panicles, having a fragrance like that of hawthorn-blossom; the fruit is downy, oval, or pear-shaped, yellow, and about the size of a large gooseberry. The seeds have an agreeable flavour, which they impart to tarts. The L. lives in the open air in the south of England, and produces fruit; but a warmer climate is required for fruit of fine quality. It is a not unfrequent in hothouses. It may be grafted on any species of *Mespilus*.—The species of *Eriobotrya* are all evergreen. The **CULLA** (*E. dillipica*) is a native of Nepal, and produces an eatable fruit.

LORANTHACEÆ. See **MISTLETOE**.

LOBEA (ancient *Eliocroca*), a town of Spain, province of Murcia, 40 miles south-west of the city of that name, on the right bank of the Sangonera, a picturesque situation on an eminence crowned by a fortified castle commanding a magnificent view. Next to Murcia, L. is the most flourishing town in the province, possessing substantial houses, 8 churches, 9 monasteries, many oil and flour mills, saltpetre and powder works, lead-mines, and manufactures of cotton, &c. Pop. 31,000.

LORD (Saxon *hlaford*, from *hlaf*, loaf of bread, and *ford*, to give, *quasi*, one who feeds the people), a title given in Great Britain to persons either noble by birth or by creation. Peers of the realm are styled, including such archbishops or bishops as are members of the House of Lords, who are **Lords Spiritual**. By courtesy, the title Lord is given to the eldest sons of dukes, marquises, and earls, prefixed to an inferior title of the peerage, and to the younger sons of dukes and marquises, prefixed to their Christian name and surname. The following official persons bear the title lord in virtue of their employments—the Lord-lieutenant of Ireland and Lord-lieutenant of counties (see **LIEUTENANT**, **LORD**), the Lord Chancellor (see **CHANCELLOR**), Lord Privy Seal (see **PRIVY SEAL**), Lords of the Treasury (see **TREASURY**) and of the Admiralty (see **ADMIRAL**), the Lord High Admiral, Lord Great Chamberlain, and Lord Chamberlain (see **CHAMBERLAIN**, **LORD**), Lord High Constable (see **CONSTABLE**), Lord High Almoner (see **ALMONER**), Lord High Steward (see **STEWART**),

Fig. 6.

arrangement for projecting the shuttle backwards and forwards is very simple. On each side of the loom, exactly in a line with the *shed*, is a groove of about eighteen inches, in which the shuttle lies free; and there is a very simple arrangement by which a piece of leather and a strap are made to act like a sling on each side; and the grooves or *shuttle-races*, as they are called, guide the movement with such precision that the shuttle is sent flying through the shed from side to side with unerring exactness. This arrangement will be seen by reference to fig. 6, F, which is given to shew the great simplicity and compactness now attained in the power-loom, three of which can stand in the space occupied by one of the cumbersome machines formerly in use. There are few machines in use which have had more mechanical ingenuity displayed in their improvement than the loom; but as it is not the object of this article to do more than give the general principles upon which the machine works, the reader is referred for fuller information to the thick volume of the *Abstract of Patents for Weaving*, published by the Patent Commissioners.

LOON. See **DIVER**.

LOOPHOLES, in Fortification, are small apertures in the walls, through which sharp-shooters may fire. The loophole should widen towards the outside, that the shooter may have a sweep with his rifle; and it is of importance, on that account, so to fashion the sides that a bullet may not penetrate, unless fired straight into the centre. For this purpose, the stones are

Loophole—horizontal section.

190

Lord Steward of the Household, Lords in Waiting, Lords of the Bedchamber (see **BEDCHAMBER, LORDS OF THE**), **Lords Justices** (see **JUSTICES, LORDS**), the **Lord Chief Baron of Exchequer** (q. v.), the **Lord Chief Justice** (see **JUSTICE, LORD CHIEF**), the **Lord Lyon** (see **LYON KING AT ARMS**), the **Lord Mayor of London, York, and Dublin** (see **MAYORS**), and the **Lords Provost of Edinburgh and Glasgow** (see **PROVOST**). The committee of the Scottish parliament by whom the laws to be proposed were prepared, were called **Lords of the Articles**. The favoured beneficiaries, who, after the Scottish Reformation, obtained in temporal lordship the benefices formerly held by bishops and abbots, were called **Lords of Erection**. Persons to whom rights of regality were granted in Scotland (see **REGALITY**), were termed **Lords of Regality**. The representative of the sovereign in the General Assembly of the Church of Scotland (see **ASSEMBLY, GENERAL**), is called the **Lord High Commissioner**. The judges of the Courts of Session and Justiciary in Scotland have the title 'Lord' prefixed to their surname or some territorial designation assumed by them; and throughout the three kingdoms, judges are addressed 'My Lord' when presiding in court.

LORD ADVOCATE OF SCOTLAND. See **ADVOCATE**.

LORD OF THE MANOR, the owner of a manor having copyhold tenants. See **MANOR**.

LORD ORDINARY. See **COURT OF SESSION**.

LORDS, HOUSE OF. See **PARLIAMENT**.

LORD'S-DAY, in point of law, has been made the subject of several statutes. The chief statute in England is the *Lord's-day Act*, 29 Ch. II. c. 7, which enacted that no tradesman, artificer, workman, or labourer should exercise the worldly labour, business, or work of his ordinary calling upon the Lord's-day (works of necessity and charity only excepted), nor any person should publicly cry, or expose to sale, wares, fruit, herbs, &c.; but nothing in the act was to extend to prohibiting the dressing of meat in families or inns, cook-shops or victualling houses, nor the selling of milk within certain hours. To these exceptions, selling mackerel and baking bread were added subsequently. These statutes have been construed strictly by the courts on the ground that they restrain the liberty of the subject, for, without a statute, ordinary work would be as competent on the Sunday as on any other day. Hence, unless a case comes within the strict letter of the statute, there is no disability. Thus, a horse may be sold on Sunday by one who is not a horse-dealer, for then it is not part of the seller's ordinary calling. So a farmer may hire a servant on that day; indeed, the statute does not apply to farmers, attorneys, surgeons, and those not included in the above statutory description, and therefore those parties can do their work on Sunday as on other days. Irrespective of any statute, it has been the immemorial course of practice in courts of law not to do legal business on Sunday, and not to recognise the service of writs, warrants, &c., of a civil nature, if made on Sunday. Thus, no debtor can be arrested for debt on Sunday, and hence he may walk at large that day, free from molestation of bailiffs. But if any crime has been committed, the party can be arrested on Sunday as well as other days. There is a special provision by statute as to ale-houses, beer-houses, and refreshment-houses being open on Sundays, the general effect of which is only to close these places during church hours. If any game is pursued on Sunday, whether by poachers or not, a penalty is incurred. There is also a statute of 1 Ch. I. prohibiting sports or pastimes of certain descriptions. Except as above mentioned, there is no difference made as to the

validity of acts done on Sunday, though it is an erroneous popular impression that deeds or wills, bills of exchange, &c., dated or executed on Sunday are invalid.

In Scotland, the law varies in some respects from that of England on this matter. There also contracts made on Sunday are not null at common law, but numerous statutes have passed prohibiting contracts, whether made in the course of one's ordinary business or not, and whether made by workmen, artificers, &c., or not. But there is an exception of works of necessity, and mercy. It is, however, doubtful how far these old statutes are in desuetude or not, and judges have said they only apply to public not private acts done on Sunday. In Scotland, the rule is acted on, that the enforcement of decrees and warrants, pointings, and other process or diligence in civil matters, are void; but it is otherwise in criminal matters. It is singular that there is no distinct penalty imposed in Scotland, as there is in England and Ireland, by the Game Acts, on persons sporting on Sunday. But Scotland outstrips England and Ireland in the stringency with which public-houses are prohibited from being open on that day. See **PUBLIC-HOUSES**.

LORD'S SUPPER, THE, is one of the sacraments of the Christian religion (see **SACRAMENT**). It is so called from its being instituted at supper by Jesus Christ, whom his disciples styled the Lord or Master. It receives also the names of Eucharist and Communion (q. v.). With the exception of the Quakers, all sects of Christians, however different their views as to its nature, agree in celebrating it as one of the most sacred rites of religion. The present article is written from the point of view of those who admit more or less the idea of a historical development of the doctrines connected with the Lord's Supper; the views of Roman Catholics, who hold that the doctrines of their church on the subject were delivered by our Lord and his apostles, and have from the first centuries been taught in substance in the church, will be found under other heads. See **MASS**; **TRANSUBSTANTIATION**.

The circumstances of sorrow amid which it was instituted, and its intimate relation to the crowning work of Jesus, his death, had, at the very outset, made a deep impression upon the early church. Not only was the solemnity, in conformity with its original institution, repeated daily in conjunction with the so-called *Agape* (q. v.) (love-feasts), and retained as a separate rite when these feasts were set aside; but from the very first it was believed to possess a peculiar efficacy, and soon ideas of the wonderful and mystical became associated with it. The Lord's Supper was celebrated on every important occasion of life—when entering on marriage, when commemorating departed friends and martyrs, &c.; to those that could not be present at the meeting of the congregation, such as prisoners, sick persons, and children, the indispensable food of heaven was carried by the deacons, and in some churches—those of Africa, for instance—the communicants took part of the materials of the feast home with them, that they might welcome the gift of a new day with consecrated food. Heathens also and unworthy persons were excluded from this holy mystery. As early as the 2d c., Ignatius, Justin Martyr, and Irenæus advance the opinion, that the mere bread and wine became, in the Eucharist, something higher—the earthly, something heavenly—without, however, ceasing to be bread and wine. Though these views were opposed by some eminent individual Christian teachers, such as Origen (died 254), who took a figurative conception of the sacrament, and

depreciated its efficacy; yet both among the people and in the ritual of the church, more particularly after the 4th c., the miraculous or supernatural view of the Lord's Supper gained ground. After the 3d c., the office of presenting the bread and wine came to be confined to the ministers or priests. This practice arose from, and in turn strengthened the notion which was gaining ground, that in this act of presentation by the priest, a sacrifice, similar to that once offered up in the death of Christ, though bloodless, was ever anew presented to God. This still deepened the feeling of mysterious significance and importance with which the rite of the Lord's Supper was viewed, and led to that gradually increasing splendour of celebration which under Gregory the Great (590) took the form of the mass. See MASS. As in Christ two distinct natures, the divine and the human, were wonderfully combined, so in the Eucharist there was a corresponding union of the earthly and the heavenly.

For a long time there was no formal declaration of the mind of the church on the presence of Christ in the Eucharist. At length, in the first half of the 9th c., a discussion on the point was raised by the Abbot of Corvei, Paschasius Radbertus, and Ratramnus, a learned monk of the same convent; they exchanged several violent controversial writings *De Sanguine et Corpore Domini*, and the most distinguished men of the time took part in the discussion. Paschasius maintained that the bread and wine are, in the act of consecration, transformed by the omnipotence of God into that very body of Christ which was once born of Mary, nailed to the cross, and raised from the dead. According to this conception, nothing remains of the bread and wine but the outward form, the taste and the smell; while Ratramnus would only allow that there is some change in the bread and wine themselves, but granted that an actual transformation of their power and efficacy takes place. The greater accordance of the first view with the credulity of the age, its love of the wonderful and magical, as well as with the natural desire for the utmost possible nearness to Christ, in order to be unfailingly saved by him, the interest of the priesthood to add lustre to a rite which enhanced their own office, and the apparently logical character of the inference, that where the power, according to universal admission, was changed, there must be a change also of the substance; the result of all these concurring influences was, that when the views of Ratramnus were in substance revived by Berengarius, Canon of Tours, in opposition to Lanfranc, Bishop of Canterbury, and Cardinal Humbert, the doctrine of Transubstantiation, as it came to be called, triumphed, and was officially approved by the Council of Rome in 1079. In the fourth Lateran Council at Rome, 1215, under Innocent III., Transubstantiation was declared to be an article of faith; and it has continued to be so held by the Roman Catholic Church to the present day. The Greek Catholic Church sanctioned the same view of Transubstantiation at the Synod of Jerusalem in 1672.

The Reformation of the 16th c. again raised the question on the nature of the Eucharist. The Lutheran Church rejected from the first the Catholic doctrine of Transubstantiation, as well as of the mass, i. e., the constant renewal of the sacrifice of Christ, and merely taught that, through the power of God, and in a way not to be explained, the body and blood of Christ are present in, with, and under the unchanged bread and wine. In opposition to this doctrine, it was laid down by Zwingli, that the Lord's Supper is a mere commemoration of the death of Christ, and a profession of belonging to his church, the bread and wine being only symbols: a view which is

adopted in substance by the Socinians, Arminians, and German Catholics. Luther bitterly opposed the symbolical view, especially towards the latter part of his career; Zwingli's doctrine was more repugnant to him than the deeper and more mystical Catholic doctrine. See IMPANATION.

Calvin sought to strike a middle course, which has been substantially followed by the Reformed churches. According to him, the body of Christ is not actually present in the bread and wine, which he also holds to be mere symbols. But the 'faithful' receiver is, at the moment of partaking, brought into union with Christ, through the medium of the Holy Spirit, and receives of that heavenly power (efficacy) which is always emanating from the glorified body in heaven. Melancthon, in this controversy, was inclined to the views of Calvin, but he thought a union might be effected by adopting the declaration that Christ in the Eucharist is 'truly and really' present (not merely in faith). The endeavours of Melancthon and his party, by arbitrary alterations of the Augsburg Confession and other means, to effect a public reconciliation, only served to rouse among the partisans of Luther a furious theological storm, and the result was the establishment of the peculiar views of Luther, and the final separation of the Lutheran and Reformed churches.

The whole controversy relates to the mode in which the body and blood of Christ are present in the Lord's Supper; for it was agreed on all hands that they are present in some way. The Reformed theologians argued that *presence* is a relative term, opposed not to distance, but to absence; and that presence, in this case, does not mean local nearness but presence in efficacy. Here they parted company both with the Roman Catholic Church and with the Lutherans. They were willing to call this presence 'real' ('if they want words,' as Zwingli said), meaning true and efficacious, but they would not admit corporal or essential presence. But while the Reformed churches were at one in holding, that by receiving the body and blood of Christ, is meant receiving their virtue and efficacy, there is some difference in their way of expressing what that efficacy is. Some said it was their efficacy as broken and shed—i. e., their sacrificial efficacy; others, in addition to this, speak of a mysterious supernatural efficacy flowing from the glorified body of Christ.

With regard to the Reformed churches, it may be remarked that their Confessions on this point were mostly formed for the express purpose of compromise, to avoid a breach with the Lutherans. Hence the language of these Confessions contains more of the mystical element, than the framers of them seem, in other parts of their writings, to favour. And it is remarkable that the Anglican Confessions which were framed under different circumstances, lean more to the symbolical view of Zwingli than those of any other of the Reformed churches. The Thirty-nine Articles, after laying down that 'to such as with faith receive the same, it is a partaking of the body of Christ,' repudiate the notion of Transubstantiation; and add: 'The body of Christ is given, taken, and eaten in the Supper only after an heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the Supper is faith.'

The Presbyterian Church of Scotland adopted substantially the views of Calvin. The words of the Westminster Confession are: 'That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called Transubstantiation) by consecration of a priest, or by any other way, is repugnant not to scripture alone, but even to

common sense and reason. . . . Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of his death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine; yet as really, but spiritually, present to the faith of believers in that ordinance, as the elements themselves are to their outward senses.'

This variety of dogmatical opinion as to the Eucharist naturally gave rise to variety in the ceremonial of its observance. The Catholic notion of a mysterious transformation, produced the dread of allowing any of the bread and wine to drop, and led to the substitution of wafers (*hostia, oblate*) for the breaking of bread. The doctrine of the 'real union,' which declares that in the bread as well as in the wine, in each singly and by itself, Christ entire is present and tasted—a doctrine which was attested by wafers visibly bleeding—caused the cup to be gradually withdrawn from the laity and non-officiating priests; this practice was first authoritatively sanctioned at the Council of Constance, 1415. All the Reformed churches restored the cup: in the Greek Church it had never been given. From the same feeling of deep reverence for the Eucharist, the communion of children gradually came, after the 15th c., to be discontinued. The Greek Church alone admits the practice. Grounded on the doctrine of Transubstantiation, the Greek and Roman Catholic Churches hold the 'elevation of the host' (*hostia, victim or sacrifice*) to be a symbol of the exaltation of Christ from the state of humiliation; connected with this is the 'adoration of the host,' and the carrying it about in solemn procession. The use of leavened bread in the Greek Church, and of unleavened in the Roman Catholic and Lutheran, of water mixed with wine in the Roman Catholic and Greek Churches, and of unmixed wine in the Protestant Churches, are trifling differences, mostly owing their origin to accidental circumstances; yet, once magnified into importance by symbolical explanations, they have given occasion to the hottest controversies. The greater part of the Reformed churches agree in breaking the bread and letting the communicants take it with the hand (not with the mouth); and this practice is owing to the original tendency of those churches to the symbolical conception of the Eucharist, in which the breaking of the bread and the pouring out of the wine are essential elements.

Although the great divisions of the Christian world have continued as churches to adhere to those doctrines about the Lord's Supper which were fixed and stereotyped in Acts of Council and Articles and Confessions about the time of the Reformation, we are not to suppose that the opinions of individuals within those churches continue equally uniform and fixed. Even Roman Catholic theologians, like Bossuet, have sometimes endeavoured to understand the doctrine of the church in a philosophical sense; and in the Lutheran Church, the greatest variety of opinion prevails. Some uphold unmodified the dogmas of Luther; others accept them with explanation; Hegel even undertook to ground them on speculative reason. Others, as Schleiermacher, would have recourse to the views of Calvin as a means of reconciliation with the Reformed churches. Even all 'supernatural' theologians do not adhere strictly to the formulas of the church; while rationalism in all its phases tends to the pure symbolism of Zwingle.

The Anglican Church is divided on this, as on several kindred topics, into two parties: with one, the symbolical view of the rite is predominant; the

other party reprobate this view as 'low,' and maintain an *objective* 'mystical presence' of the thing signified, along with the sign. Notwithstanding the 'higher' doctrine of the Scotch Confession, the tendency in Scotland seems to be more the other way; from the pulpit, the rite is oftener spoken of in its commemorative character, and the sign as means of working upon the mind and feelings subjectively, than as the vehicle of any objective, mystically operating grace.

LORETTO (properly, LORETO), a city of the province of Macerata, in the kingdom of Italy, although of some architectural pretensions, and containing 8000 inhabitants, is chiefly noticeable as the site of the celebrated sanctuary of the Blessed Virgin Mary, called the *Santa Casa*, or Holy House. The *Santa Casa* is reputed to be the house, or a portion of the house, in which the Virgin lived in Nazareth, which was the scene of the Annunciation, of the Nativity, and of the residence of our Lord with his mother and Joseph; and which, after the Holy Land had been finally abandoned to the infidel on the failure of the Crusades, is believed to have been miraculously translated, first, in 1291, to Fiume in Dalmatia, and thence, December 10, 1294, to Recanati, whence it was finally transferred to its present site. Its name (Lat. *Domus Lauretana*) is derived from Laureta, the lady to whom the site belonged. It would be out of place in a work like this to enter into any polemical discussion of this legend. Although numberless pilgrims resort to the sanctuary, and although indulgences have been attached by Julius II., Sixtus V., and Innocent XII. to the pilgrimages, and to the prayers offered at the shrine; yet the truth of the legend is no part of Catholic belief, and Catholics hold themselves free to examine critically its truth, and to admit or to reject it according to the rules of historical evidence. The church of the *Santa Casa* stands near the centre of the town, in a piazza which possesses other architectural attractions, the chief of which are the governor's palace, built from the designs of Bramante, and a fine bronze statue of Pope Sixtus V. The great central door of the church is surmounted by a splendid bronze statue of the Madonna; and in the interior are three magnificent bronze doors filled with bas-reliefs, representing the principal events of scriptural and ecclesiastical history. The celebrated Holy House stands within. It is a small brick-house, with one door and one window, originally of rude material and construction, but now, from the devotion of successive generations, a marvel of art and of costliness. It is entirely cased with white marble, exquisitely sculptured, after Bramante's designs, by Sansovino, Bandinelli, Giovanni Bolognese, and other eminent artists. The subjects of the bas-reliefs are all taken from the history of the Virgin Mary in relation to the mystery of the Incarnation, as the Annunciation, the Visitation, the Nativity, with the exception of three on the eastern side, which are mainly devoted to the legend of the Holy House itself and of its translation. The rest of the interior of the church is rich with bas-reliefs, mosaics, frescoes, paintings, and carvings in bronze. Of this material, the finest work is the font, which is a master-piece of art. The Holy House having been at all times an object of devout veneration, its treasury of votive offerings is one of the richest in the western world. It suffered severely in the French occupation of 1796, but it has since received numerous and most costly accessions. The frescoes of the Treasury Chapel are among the finest to be found outside of Rome.

L'ORIENT, a seaport of France, department of

Morbihan, situated at the confluence of the Scorff and Blavet, in lat. $47^{\circ} 48' N.$, and long. $3^{\circ} 25' W.$ Pop. 28,412. It is a well-built town, but rather dull-looking. The harbour, dockyard, and arsenal are among the best and largest in France, and the place ranks as a fortress of the third class; but its commerce received a blow at the Revolution in 1789, from which it has never recovered. L. has a communal college, a school of navigation, and another of marine artillery. The inhabitants are engaged chiefly in ship-building and the allied occupations. The only important manufacture is that of hats.

L. owes its origin to the French East India Company, which built an establishment here in 1666, for the purpose of trading to the East (whence the name of the town).

LORIMER (Fr. *lormier*, from Lat. *lorum*, a thong), a maker of bits, spurs, stirrup-irons, metal mountings for saddles and bridles, and generally of all articles of horse-furniture. In London, the lorimers, who had previously formed part of another guild, were incorporated by letters-patent in 1712; in the Scottish burghs, they have been comprehended as a branch of the corporation of Hammermen. Cutlers, locksmiths, and brass-founders have been considered as in the exercise of branches of the lorimer art, and therefore bound to enter with the corporation. The Court of Session, in 1830, held it to be a violation of the exclusive privileges of the lorimer craft to manufacture bits, stirrup-irons, and other metallic articles of horse-furniture, with a view to silver-plating them before selling.

LORIS, a genus of *Lemuridae*, differing from the true lemurs in having a round head and short muzzle, very large eyes, and no tail. The two species known are both natives of the East Indies. The largest species, *L. tardigradus*, is not so large as a cat; the other, *L. gracilis*, is much smaller.

Loris (L. gracilis).

They are nocturnal animals, and spend the day generally sleeping attached to a branch, which they grasp firmly with all their four hands, the body rolled up into a ball, and the head hidden among the legs. Their fur is rich and soft. Their motions are slow, and they advance stealthily and noiselessly on the insects and birds on which they prey. They feed, however, partly on fruits and other vegetable food; in confinement, they readily eat rice and milk, and are very fond of eggs.

LORRAINE, originally a portion of the German empire. Its history dates from 855, when Lotharius II. obtained (see CARLOVINGIANS) the lands between

the Scheldt, Rhine, Meuse, and Saône, called the Kingdom of Lotharius (*Lotharii Regnum*), or Lotharingia, or Lorraine. The district now known as Rhenish Prussia was separated from L. in the 10th c., and the remainder was divided in 1044 into two duchies, *Upper* and *Lower Lorraine*. The latter, after many vicissitudes, came into the possession of Austria, and now forms one half of the kingdom of Belgium, and the provinces of Brabant and Gelderland, in Holland. Upper L. continued to be governed by its own dukes till 1736, when it was given to Stanislas, ex-king of Poland, and on his death in 1766 was united to France, forming the province of Lorraine. It is now subdivided into the departments of the Meuse, Moselle, Meurthe, Vosges, and some of the cantons of the Lower Rhine. The inhabitants are of German origin, but speak the French language, with the exception of the district lying between Metz and the Vosges, which is called *German Lorraine*.

LORRAINE, CLAUDE. See CLAUDE LORRAINE.

LORY (*Lorius*), a genus of birds of the parrot family (*Psittacidae*), natives chiefly of the south-east of Asia and the Eastern Archipelago. They have a dense soft plumage, exhibiting the most rich and mellow colours; the tail is rounded or graduated, generally not long; the bill is feeble than in many of the parrots, and the upper mandible much arched. They are very active and lively, even in confinement, and are also of very gentle and affectionate disposition. Red, scarlet, crimson, and yellow are the prevailing colours of their plumage; but the name L. is often extended to some Australian birds of the same family, in which much more of a green colour appears, and which have a stronger bill and a much less gentle disposition. The true lories feed much on the softest and most juicy fruits, the Australian birds so called are very troublesome robbers of the fields of ripening maize.

LOSSINI (Ger. *Lusina*), an island in the Gulf of Quarnero, Adriatic Sea, forming part of the Austrian Kistenland, lies immediately south-west of Cherso (q. v.). Length, 21 miles; breadth, from 1 to 3 miles. The principal place on the island is L. Piccolo, or Little L., with 7100 inhabitants, a fine harbour, and an active trade.

LOST PROPERTY. In point of law, the finder of lost property is entitled to keep it until the owner is found; but there are certain circumstances in which the keeping of it will be considered by a jury to amount to larceny. The rule which seems to be laid down in recent cases in England, which have been fully discussed, is, that if the finder find the property in such circumstances that he either knows the owner, or has ready means of discovering him, then the taking of the property with intent to keep it will be larceny. If, for example, a servant find a sovereign in her master's house, and keep it, that would be larceny. So it was held to be larceny where the prompter on the stage of a theatre picked up a £50 note which had been dropped by one of the actors. On the other hand, if there be no reasonable probability of ever discovering the true owner, then there is no larceny. The all important point of time for the jury to inquire into is, when the finder picked up the article; for if, on examination, he did not then know who the owner was, nor had the means of ascertaining, he will not become guilty merely because he afterwards, on hearing of the owner, nevertheless keeps it. It has also been decided that the mere keeping of a lost article, in hopes of getting a reward for giving it up, and though the owner be known, does not amount to larceny. There is also no obligation on the finder of lost

property to incur expense in advertising for the owner; indeed, the owner would not be bound in England to repay such expense, though it might be different or doubtful in Scotland; and it is to be borne in mind that the real owner is not divested of his property by the loss, but can demand it from whosoever is in possession of it. But there are some peculiarities on this subject as regards lost bills of exchange and notes, which, though originally lost, yet, if transferred without notice, become the property of the transferee. Moreover, the loser of a bill or note payable to bearer cannot sue the party liable, at least without giving an indemnity. There is an exception to the rule, that the finder of lost property is entitled to it, where the property consists of gold, silver, &c., hidden in the earth, in which case the treasure-trove belongs not to the finder, but to the crown; and the finder is bound to give notice thereof to the crown, under a penalty.

LOST TRIBES. See BABYLONIAN CAPTIVITY.

LOT (ancient *Oltis*), a river of Southern France, one of the largest tributaries of the Garonne, rises at Mount Losère, in the Cevennes. It flows in a generally western direction through the departments of Losère, Aveyron, Lot, and Lot-et-Garonne, joining the Garonne from the right at Aiguillon, after a course of 270 miles. It is navigable for about 170 miles.

LOT, a department in the south of France, formed out of the province of Guienne, and comprising the arrondissements of Cahors, Gourdon, and Figeac; is watered by the Dordogne, and the Lot, with its tributary, the Sella. Area, 984,062 English acres; pop. (1892) 295,542. A range of hills, broad, but not very high, and containing some iron, runs through the centre of the department from east to west, in the form of a semicircle. The valleys yield corn, hemp, tobacco, and fruits, and the hillsides are clothed with vines. Flax-mills are numerous. Capital, Cahors (q. v.).

LOT-ET-GARONNE, a department in the south-west of France, formed out of the province of Guienne, and comprising the arrondissements of Agen, Villeneuve, Marmande, and Nérac, is watered principally by the Garonne and the Lot. Area, 1,329,531; pop. (1892) 332,065, among whom are a considerable number of French Protestants. The department is level, except in the south, where spurs of the Pyrenees make their appearance, and extremely fertile in the basins of the large rivers; but the east is chiefly composed of barren wastes, and the south-west of sandy and marshy tracts termed *Landes*. The principal products are corn, wine, excellent hemp, fruits (of which the *prunes d'Agès* of Agen are particularly celebrated), tobacco (considered the best manufactured in France), anise, and coriander. Pine, cork, and chestnut woods are numerous; domestic animals, especially poultry, are reared in great numbers for exportation. The chief metal is iron, and the department has ten ironworks, besides various manufactures more or less important.

LOTHIANS. See SCOTLAND.

LOTIONS, or WASHES, are remedies of a liquid, but not of an oily nature, which are applied to circumscribed portions of the surface of the body. Amongst the lotions most commonly employed are the *mariate of ammonia wash*, which consists of a solution of sal ammoniac in water or in vinegar with or without the addition of spirit; it is much used in contusions, where there is no wound of the skin, in chronic tumours, in enlarged joints, &c. *Chloride of soda wash*, consisting of solution of chlorinated soda diluted with from ten to twenty times its volume of

water, useful as a gargle in ulceration of the mouth and throat, and as a wash for foul ulcers generally. The *chloride of lime wash*, consisting of one or two drachms (or more) of chloride of lime in a pint of water, used for the same purposes as the preceding wash; and *black wash*, prepared by adding calomel to lime-water (generally a drachm of the former to a pint of the latter), most extensively used in venereal sores, and of service in many forms of intractable ulcers.

LOTOPHAGI (Gr. Lotus-eaters), a name applied by the ancients to a peaceful and hospitable people inhabiting a district of Cyrenaica, on the north coast of Africa, and much depending for their subsistence on the fruit of the lotus-tree, from which they also made wine. According to Homer, they received Ulysses hospitably, when, in the course of his wanderings, he visited them along with his companions, on whom, however, the sweetness of the lotus-fruit exercised such an influence, that they forgot all about their native country, and had no desire to return home. This feeling of happy languor has been expressed with marvellous felicity by Tennyson in his poem on the Lotus-eaters.

LOTTERY, a game of hazard, in which prizes are drawn by lot. Usually, a lottery comprises a specified quantity of tickets, each numbered, every ticket-holder having a right to draw from a box a prize or blank, as the case may happen to be, and thus gain or lose. Lotteries are, of course, got up for the sake of the profit which they may yield to their proprietors; for the aggregate sum expended in prizes always falls short of the aggregate purchase-money for tickets. Whatever be the actual form of the lottery, it is indisputably a gambling transaction, the risks and losses of which are now acknowledged to be demoralising. Lotteries are said to have been first employed by the Genoese government as a means of adding to the revenue of the country, and the bad example was soon followed by the governments of other nations. The first lottery in England appears to have been in the year 1569, and the profits went to the repair of harbours and other public works. The same means was frequently afterwards resorted to for additions to the revenue, or for particular objects, under control or by sanction of the government, the mode of conducting the lottery, and the conditions, being from time to time varied. In the early years of the present century, the state lottery, as it was usually called, was one of the regular institutions of the country. Usually, the number of tickets in a lottery was 20,000, at a value of £10 each in prize. At this valuation they were offered to the competition of contractors, and ordinarily assigned at an advance of £5 or £6 per ticket. The contracting party sold them to the public at a further advance of £4 to £5 per ticket; and thus the value was about doubled. The contractor devised the scheme of prizes and blanks—there being always a few prizes of large amount, to tempt purchasers. To accommodate persons with moderate means, certain tickets were divided into halves, and others into quarters, eighths, or sixteenths. A common price for a sixteenth was £1, 11s. 6d. In the event of the number which it bore being drawn a prize of £20,000, a sixteenth part of that sum was paid, and so on with other prizes. The dexterity of the contractors consisted in drawing up 'schemes,' which in all varieties of placards and hand-bills were issued in profusion through the means of agents all over the country. The drawing took place on a specified day or days in a public hall in London, before certain commissioners, and was in this wise. Two machines, called 'wheels,' were appropriated, one

for the numbers, and the other for the prizes and blanks. On a number being drawn, its fate was determined by the billet which next afterwards came out. Two boys were the operators, one at each wheel. On the grounds of injury to public morals, lotteries were altogether abolished by act of parliament in 1826. Persons advertising or circulating tickets for foreign lotteries may be sued for a penalty by the Attorney-general, or Lord-advocate, or the Commissioners of Stamps. It required a special statute, therefore, to legalise art-unions, which are only lotteries under a specious form; but owing to their supposed good effects in encouraging art, they were exempted from penalties by the statute 9 and 10 Vict. c. 48, and a similar voluntary association was excepted by the statute 21 and 22 Vict. c. 102. In France, the abolition of lotteries took place in 1836, and in Hesse-Darmstadt in 1852. The other German states, however, continue the use of them; and in 1841, Prussia derived from them a revenue of more than 900,000 thalers, Austria, of 3,600,000 florins. In Rome and the Papal territory, they survive in full vigour. Few worse ways of supplying the exchequer of a country have almost ever been imagined; and the only excuse urged is, that the gambling spirit exists, and will find some means of gratification, even if lotteries were abolished. It was found, however, in France that the abolition of lotteries was immediately followed by an increase of savings-bank deposits; and it has been everywhere observed, that the purchasers of lottery-tickets have been to a great extent persons belonging, not to the wealthiest classes of society, but to those in which economy and prudence are most necessary to the comfort of families and the general welfare of the state.

LOTUS. The name *Lotus* (Lat. *Lotus*) was given by the Greeks to a number of different plants whose fruit was used for food. One of the most notable of these is the *Zizyphus Lotus*, a native of the north of Africa and the south of Europe, belonging to the

Nymphaea Lotus.

natural order *Rhamneæ*. See **JUJUBE**. It is a shrub of two or three feet high, and its fruit, which is produced in great abundance, is a drupe of the size of a wild plum, with an almost globose kernel. This fruit is somewhat farinaceous, and has a pleasant, sweetish, mucilaginous taste. It is called by the Arabs *Nabb* or *Nabba*; and has, from the earliest times, served as an article of food to the inhabitants of the north of Africa, where it is still a principal part of the food of the poor. Probably it was on this fruit that Homer's *Lotophagi* (q. v.) lived.—The fruit of the *Disopyrus Lotus*, or Date Plum, was sometimes called the *lotus*. See **DATE**.

PLUM.—The name *L.* was also given to several beautiful species of Water-lily (q. v.), especially the **BLUE WATER-LILY** (*Nymphaea caerulea*), and the **EGYPTIAN WATER-LILY** (*N. lotus*), and to the **NELUMBO** (q. v.) (*Nelumbium speciosum*), which grows in stagnant and slowly running water in the south of Asia and north of Africa. The *Nymphaea* was called by the Egyptians *Shania* or *Shania*, and by the Arabs *Beshnia*, the Coptic name was the masculine article. It grows in the Nile and adjacent rivulets, and has a large white flower. The root is eaten by the people who live near the lake Menzaleh. The rivulets near Damietta abound with this flower, which rises two feet above the water. It was the rose of ancient Egypt, the favourite flower of the country, and is often made into wreaths or garlands, placed on the heads of females, or held in their hands, and used for its fragrance. It frequently appears in the hieroglyphs, where it represents the Upper Country or Southern Egypt, and entered largely into works of art—the capitals of columns, prows of boats, heads of staves, and other objects being fashioned in its shape. In the mythology, it was the special emblem of *Nefer Atum*, the son of Ptah and Bast, the god Harpocrates is seated upon it; and there was a mystical *L.* of the sun. In the mythology of the Hindus and Chinese, the *L.* plays a distinguished part. It is the *Nelumbo*. The Hindu deities of the different sects are often represented seated on a throne of its shape, or on the expanded flower. The colour in Southern India is white or red, the last colour fabled to be derived from the blood of Siva, when Kamadeva, or Cupid, wounded him with the love-arrow. *Lakshmi*, also, was called the 'lotus-born,' from having ascended from the ocean on its flower. It symbolised the world; the *Mercure*, residence of the gods; and female beauty. Among the Chinese, the *L.* had a similar reputation and poetic meaning, being especially connected with Fuh, or Buddha, and symbolising female beauty, the small feet of their women being called *lotus* or 'golden lilies.'

LOUDON, JOHN CLAUDIUS, a distinguished botanist and horticulturist, born April 8, 1783, at Cambuslang, in Lanarkshire. He became a gardener, and in 1803 published *Observations on Laying out Public Squares*, and in 1805, a *Treatise on the Houses*; and afterwards became the author of a number of works on botany, mostly of a somewhat popular character, which have contributed much to extend a knowledge of that science and a taste for horticulture. Amongst these are the *Encyclopedia of Gardening* (1822); and of *Agriculture* (1825); the *Green-house Companion* (1825); the *Encyclopedia of Plants* (1829); and the *Arboretum et Fruticetum Britannicum* (3 vols. 1838), containing a very full account of the trees and shrubs, indigenous or introduced, growing in the open air in Britain. This is his great work; but the expense attending its publication, owing chiefly to the number of plates involved him in pecuniary difficulties. He died at Bayswater, December 14, 1843. *L.* established 11 different magazines, which he edited simultaneously with his *Arboretum*.—His widow is the authoress of a number of pleasing popular works, chiefly on subjects connected with botany and gardening.

LOUGHBOROUGH, a manufacturing and market-town of England, in the county of Leicestershire, 12 miles north-north-west of the town of

that name. The chief educational institution in the town is the Burton Foundation (dating from 1495), with an annual income from endowment of £1742 16s. With this Foundation, five distinct schools are connected, each pupil having to pay a small sum. L. carries on extensive manufactures of patent Angola hosiery, of other woollen and cotton goods, elastic webs, net-lace, and shoes. Pop. (1861) 10,830.

LOUGHREA, a market-town of Ireland, in the county of Galway, about 20 miles east-south-east of the town of that name. It stands on the north bank of Lough Rea, a beautiful little lake four miles in circumference. It contains a Roman Catholic chapel, with a Carmelite friary and nunnery, and the remains of a Carmelite abbey founded in 1300. Manufactures of narrow linen and coarse diapers; brewing and tanning are carried on. Pop. (1861) 3063.

LOUIS (properly **LUDWIG**) **THE GERMAN**, the third son of Louis le Débonnaire, was born about 845, and by the treaty at Verdun, in 843, L. obtained Germany, and became the founder of a distinct German monarchy. He died at Frankfurt, 28th August 876. His kingdom was divided amongst his three sons: Carlmann obtaining Bavaria, Carinthia, and the tributary Slavonic countries; Louis obtaining Franconia, Thuringia, Saxony, and Friesland; Charles the Fat obtaining Swabia, from the Maine to the Alps. See **CARLOVINGIANS**.

LOUIS I. See **CARLOVINGIANS**.

LOUIS IX., or **SAINT LOUIS**, king of France, born in Poissy, April 25, 1215, succeeded his father, Louis VIII., in 1226. His mother, Blanche of Castile, a woman of great talent and sincere piety, was regent during his minority, and bestowed on him a strictly religious education, which materially influenced his character and policy. When L. attained his majority, he became involved in a war with Henry III. of England, and defeated the English at Taillebourg, at Saintes, and at Blaye in 1242. During a dangerous illness, he made a vow that, if he recovered, he would go in person as a Crusader, and accordingly, having appointed his mother regent, he sailed, in August 1248, with 40,000 men to Cyprus, whence, in the following spring, he proceeded to Egypt, thinking, by the conquest of that country, to open the way to Palestine. He took Damietta, but was afterwards defeated and taken prisoner by the Mohammedans. A ransom of 100,000 marks of silver procured his release on May 7, 1250, with the relics (6000 men) of his army. He proceeded by sea to Acre, and remained in Palestine till the death of his mother (November 1252) compelled his return to France. He now applied himself earnestly to the affairs of his kingdom, united certain provinces to the crown on the lapse of feudal rights or by treaty, and made many important changes, the general tendency of which was to increase the royal power. A code of laws was brought into use, known as the *Établissements de St Louis*. L. embarked on a new Crusade, July 1, 1270, and proceeded to Tunis; but a pestilence breaking out in the French camp, carried off the greater part of the army and the king himself. He died August 25, 1270; and his son, Philip III., was glad to make peace and return to France. Pope Boniface VIII. canonised him in 1297. For an interesting picture of the religious side of L.'s character, consult Neander's *Kirchengeschichte*. Bohn, vol. vii. pp. 416—418.

LOUIS XI., king of France, the eldest son of Charles VII., born at Bourges, July 3, 1423, was from his boyhood eminently cruel, tyrannical, and perfidious. He made unsuccessful attempts against

his father's throne, was compelled to flee to Brabant, and sought the protection of Philip the Good, Duke of Burgundy, with whom he remained till his father's death in 1461, when he succeeded to the crown. The severe measures which he immediately adopted against the great vassals, led to a coalition against him, at the head of which were the great Houses of Burgundy and Bretagne. L. owed his success more to his artful policy than to arms; and the war threatening to break out anew, he invited Charles the Bold, Duke of Burgundy, to a friendly conference at Péronne, in October 1468. His agents, meanwhile, had stirred up the people of Liege to revolt against the duke, upon the news of which occurrence, Charles made the king a prisoner, and treated him roughly. On the death of the Duke of Burgundy in 1477, who left an only daughter, L. claimed great part of his territories as male fiefs lapsed to the superior, and wished to marry the young duchess to his eldest son, a boy of seven years. On her marriage with the Archduke Maximilian, he flew to arms; but a peace was concluded at Arras, December 25, 1482, by which the daughter of Maximilian was betrothed to the dauphin (afterwards Charles VIII.), and the counties of Burgundy and Artois were handed over to France. L. was also successful—after the use of means far from honourable—in annexing Provence to the crown as a lapsed fief. He greatly increased the power of the French monarchy. The latter years of his reign were spent in great misery, in excessive horror of death, which superstitious and ascetic practices failed to allay. He died August 30, 1483. It was calculated that he put about 4000 persons to death in the course of his reign, mostly without form of trial. Yet he was a patron of learning, and is said to have been the author of *Les cent Nouvelles nouvelles*, a sort of imitation of the *Decameron*, and of the *Rosier des Guerres*, a book of instruction for his son. He also materially advanced the civilisation of France by encouraging manufactures, commerce, and mining. He improved the public roads and canals, established several printing-presses, and founded three universities.

LOUIS XIII., king of France, son of Henri IV. and Marie de' Medici, born at Fontainebleau 27th September 1601, succeeded to the throne on the death of his father, 14th May 1610, his mother becoming regent. She entered into close alliance with Spain, and betrothed the king to Anne of Austria, daughter of Philip III. of Spain, upon which the Huguenots, becoming apprehensive of danger, took up arms; but peace was concluded at St Menesould, on 5th May 1614; and the king, who was now declared of age, confirmed the Edict of Nantes, and called an Assembly of the States, which was soon dismissed, because it began to look too closely into financial affairs. See **MARIE DE' MEDICI**. The suppression of Protestantism and liberty in Bearn led to the religious war, in which the Protestants lost almost all their places of security, and which ended in 1622. After the death of De Luynes, in 1624, Richelieu, afterwards Cardinal and Duke, became the chief minister of Louis. His powerful mind obtained complete control over that of the weak king, and his policy effected that increase of monarchical power, at the expense of Protestants, nobles, and parliaments, which reached its consummation in the reign of Louis XIV. The overthrow of the Huguenots was completed by the capture of Rochelle, 20th October 1628, at the siege of which the king took part in person. In 1631, his brother, the Duke of Orleans, having left the court, assembled a troop of Spaniards in the Netherlands, and entered France to compel the dismissal of Richelieu, whom he hated.

and whom the king also secretly disliked; but the duke was completely defeated by Marshal Schomberg at Castelnaudary. Richelieu now led L. to take part in the Thirty Years' War, openly supporting Gustavus Adolphus and the Dutch against the Spaniards and Austrians. The latter years of L.'s reign were signalled by the acquisition of Alsace and of Roussillon. L. died 14th May 1643, a few months after his great minister. His queen, after having been 23 years married, bore a son in 1638, who succeeded to the throne as Louis XIV.; and in 1640, a second son, Philip, Duke of Orleans, from whom the present House of Orleans is descended.

LOUIS XIV., king of France, born at St Germain-en-Laye 16th September 1638, succeeded his father, Louis XIII., in 1643. His mother, Anne of Austria, became regent, and Mazarin (q.v.) her minister. During the king's minority, the discontented nobles, encouraged by Spain, sought to shake off the authority of the crown, and the civil wars of the *Fronde* (q.v.) arose. Peace was concluded in 1659; and in the following year L. married the Infanta Maria Theresa, a princess possessing neither beauty nor other attractive qualities. Little was expected from the young king; his education had been neglected, and his conduct was dissolute; but on Mazarin's death, in 1661, he suddenly assumed the reins of government, and from that time forth carried into effect with rare energy a political theory of pure despotism. His famous saying, '*L'état c'est moi*' (I am the state), expressed the principle to which everything was accommodated. He had a cool and clear head, with much dignity and amenity of manners, great activity, and indomitable perseverance. The distress caused by the religious wars had created throughout France a longing for repose, which was favourable to his assumption of absolute power. He was ably supported by his ministers. Manufactures began to flourish under the royal protection. The fine cloths of Louviers, Abbeville, and Sedan, the tapestries of the Gobelins, the carpets of La Savonnerie, and the silks of Tours and Lyon acquired a wide celebrity. The wonderful talents of Colbert (q.v.) restored prosperity to the ruined finances of the country, and provided the means for war; whilst Louvois (q.v.) applied these means in raising and sending to the field armies more thoroughly equipped and disciplined than any other of that age.

On the death of Philip IV. of Spain, L., as his son-in-law, set up a claim to part of the Spanish Netherlands; and in 1667, accompanied by Turenne (q.v.), he crossed the frontier with a powerful army, took many places, and made himself master of that part of Flanders since known as French Flanders, and of the whole of Franche Comté. The triple alliance—between England, the States-general, and Sweden—arrested his career of conquest. The treaty of Aix-la-Chapelle (1668) forced him to surrender Franche Comté. He vowed revenge against the States-general, strengthened himself by German alliances, and purchased with money the friendship of Charles II. of England. He seized Lorraine in 1670; and in May 1672 again entered the Netherlands with Condé and Turenne, conquered half the country in six weeks, and left the Duke of Luxembourg to lay it waste. The States-general formed an alliance with Spain and with the Emperor, but L. made himself master of ten cities of the empire in Alsace; and in the spring of 1674, took the field with three great armies, of which he commanded one in person, Condé another, and Turenne a third. Victory attended his arms; and notwithstanding the death of Turenne, and the retirement of the Prince of Condé from active service, he continued in subsequent years, along with

his brother, the Duke of Orleans, to extend his conquests in the Netherlands, where, by his order, and according to the ruthless policy of Louvois, the country was fearfully desolated. The Peace of Nimeguen, in 1678, left him possession of many of his conquests. He now established *Chambres de Réunion* in Metz, Breisach, and Besançon, pretended courts of law, in which his own will was supreme, and which confiscated to him, as feudal superior, a right of his conquests, territories which he wished to acquire, seigniories belonging to the Elector Palatine, the Elector of Treves, and others. He also, on 30th September 1681, made a sudden and successful attack on Strasburg, a free German city, the possession and fortification of which added greatly to his power on the Rhine. The acquisition thus made, a treaty in 1684 confirmed to him.

L. had now reached the zenith of his career. All Europe feared him; his own nation had been brought by tyranny, skilful management, and military glory, to regard him with Asiatic humility, admiring and obeying; all remnants of political independence had been swept away; no Assemblies of the States or of the Nobles were held; the nobles had lost both the desire and the ability to assert political power; the municipal corporations no longer exercised any right of election, but received appointments from officials from the court; the provinces were governed by *intendants*, who were immediately responsible to the ministers, and they to the king, who was his own prime minister. Even the courts of justice yielded to the absolute sway of the monarch, and interfered at pleasure with the ordinary course of law, by the appointment of commissions, or withdrew offenders from the jurisdiction of the courts by *Lettres de Cachet* (q.v.), of which he issued about 3000 in the course of his reign. He asserted a right to dispose at his pleasure of all properties within the boundaries of his realm, and took credit to himself for gracious moderation in exercising it sparingly. The court was the very heart of the political and national life of France, and there the utmost splendour was maintained; and a system of etiquette was established, which was a sort of perpetual worship of the king.

It was a serious thing for France and the world when L. fell under the control of his mistress, the Marquise de Maintenon (q.v.), whom he married in a half-private manner in 1683, and who was herself governed by the Jesuits. One of the first effects of this change was the adoption of severe measures against the Protestants. When it was reported to L. that his troops had converted all the heretics he revoked the Edict of Nantes in 1685, and then came a bloody persecution; whilst more than half a million of the best and most industrious of the inhabitants of France fled, carrying their skill and industry to other lands. Yet L. was by no means willing to yield too much power to the pope; and quarrelling with him concerning the revenues of vacant bishoprics, he convened a council of French clergy, which declared the papal power to extend only to matters of faith, and even in these to be dependent upon the decrees of councils.

The Elector of the Palatinate having died in May 1685, and left his sister, the Duchess of Orleans, heiress of his movable property, L. claimed for her also all the allodial lands; and from this and other causes arose a new European war. A French army invaded the Palatinate, Baden, Württemberg, and Treves in 1688. In 1689, the Lower Palatinate and neighbouring regions were laid waste by fire and sword. This atrocious proceeding led to a new coalition against France. Success for a time attended the French arms, particularly in Savoy and at the battle of Steinkerk. Reverses, however, ensued.

the war was waged for years on a great scale, and with various success; and after the French, under Luxembourg, had gained, in 1693, the battle of Neerwinden, it was found that the means of waging war were very much exhausted, and L. concluded the peace of Ryswick on 20th September 1697. The navy destroyed, the finances grievously embarrassed, the people suffering from want of food, and discontentment deep and general, L. placed the Count D'Argenson at the head of the police, and established an unparalleled system of espionage for the maintenance of his own despotism. The power of Madame de Maintenon and her clerical advisers became more and more absolute at the court, where scandals of every kind increased.

When the death of Charles II. of Spain took place on 1st November 1700, it was found that L. had obtained his signature to a will by which he left all his dominions to one of the grandsons of his sister, who had been L.'s queen. L. supported to the utmost the claim of his grandson (Philip V.), whilst the Emperor Leopold supported that of his son, afterwards the Emperor Charles VI. But the power of France was now weakened, and the war had to be maintained both on the side of the Netherlands and of Italy. One bloody defeat followed another; Marlborough was victorious in the Low Countries, and Prince Eugene in Italy; whilst the forces of L. were divided and weakened by the employment of large bodies of troops against the Camisards in the Cevennes, for the extinction of the last relics of Protestantism. On the 11th April 1713, peace was concluded at Utrecht, the French prince obtaining the Spanish throne, but France sacrificing valuable colonies. A terrible fermentation now prevailed in France, and the country was almost completely ruined; but the monarch maintained to the last an unbending despotism. He died, after a short illness, 1st September 1715. He was succeeded by his great-grandson, Louis XV. His son, the Dauphin, and his eldest grandson, the Duke of Bretagne, had both died in 1711. Louis had a number of natural children, and he had legitimised those of whom Madame de Montespan was the mother; but the parliament, which made no objection to recording the edict when required by him, made as little objection to annulling it when required by the next government. The 'works' of Louis XIV. (6 vols. Paris, 1806), containing his instructions for his sons, and many letters, afford important information as to his character and the history of his reign. The reign of Louis XIV. is regarded as the Augustan age of French literature and art, and it can hardly be doubted that France has never since produced poets like Corneille and Racine in tragedy, or Molière in comedy; satirists like Boileau, or divines like Bossuet, Fenelon, Bourdaloue, and Massillon.

LOUIS XV., king of France, the great-grandson of Louis XIV., born at Versailles 16th February 1710, succeeded to the throne 1st September 1715. The Duke of Orleans, as first prince of the blood, was regent during the minority of the king, whose education was intrusted to Marshal Villeroi and Cardinal Fleury. The country was brought to the verge of ruin during the regency, by the folly of the regent and the financial schemes of the celebrated Scotchman, Law (q. v.). When L. was fifteen years of age, he married Maria Leszcynski, daughter of Stanislas, the dethroned king of Poland. Fleury was for a long time at the head of affairs, and by parsimony succeeded in improving the condition of the finances. It was his policy also to avoid war, in which, however, L. was involved in 1733, in support of his father-in-law's claim to the throne of Poland; the result

being that L. obtained Lorraine for his father-in-law, and ultimately for France. Notwithstanding the vigour with which this war was conducted, the character of L. now became completely developed as one of the utmost sensuality, selfishness, and baseness. He surrounded himself with the vilest society, utterly forsook his queen, and lived, as he continued to do to the end of his life, in extreme debauchery, such as has rendered his name a proverb. In 1740, the war of the Austrian Succession broke out, in which the French arms were by no means very successful, and during which Fleury died. The king was present, in 1745, at the great victory of Fontenoy, and shewed plenty of courage. In the preceding year, during a dangerous illness, he had made vows of reforming his life, and dismissed his mistresses; but on recovering health, he presently relapsed into vice. The peace of Aix-la-Chapelle, in 1748, was very much due to the entreaties of Madame de Pompadour, whose influence the Empress Elizabeth of Russia secured by bribes and flatteries. France gained nothing by this war; but her people were ruined, and her navy destroyed.

The king now sank completely under the control of Madame de Pompadour, who was both concubine and procuress, and to whom he gave notes on the treasury for enormous sums, amounting in all to hundreds of millions of livres. War broke out again with Britain concerning the boundaries of Acadia (Nova Scotia), and was for some time prosecuted with considerable vigour. In 1756, an extraordinary alliance was formed between France and Austria, contrary to the policy of ages, and chiefly through the influence of Madame de Pompadour; but as she disposed of the command of the French armies at her pleasure, success did not attend their operations. The state of the finances, the dispirited condition of the army, and the outcry of the distressed people, were not sufficient to induce the king to make peace; but governed by his mistress, he obstinately persevered in war, even after the terrible defeat of Minden in 1759; whilst the British conquered almost all the French colonies both in the East and West Indies, with Cape Breton and Canada. A peace, most humiliating to France, was at last concluded in 1763.

L., although indifferent to the ruin of his people, and to everything but his own vile pleasures, was reluctantly compelled to take part in the contest between Madame de Pompadour and the Jesuits, the result of which was the suppression of the order in 1764. See JESUITS. The parliaments, emboldened by their success in this contest, now attempted to limit the power of the crown, by refusing to register edicts of taxation; but the king acted with unusual vigour, maintaining his own absolute and supreme authority, and treating the attempt of the parliaments to unite for one object as rebellious. The Duke of Choiseul was now displaced from office; a new mistress, Madame Du Barry, having now come into the place of Madame de Pompadour; and a ministry was formed under the Duke d'Aiguillon, every member of which was an enemy of the parliaments, and an object of popular detestation. The councillors of the parliament of Paris were removed from their offices, and banished with great indignity; and an interim parliament was appointed (January 1771), which duly obeyed the court. The princes of the blood protested against this arbitrary act, which deeply moved the popular indignation. The king, when told of the ruin of the country, and the misery and discontent of the people, only remarked that the monarchy would last as long as his life; and continued immersed in sensual pleasures and trifling amusements. He boasted of being the best cook in

France, and was much gratified when the courtiers ate eagerly of the dishes which he had prepared. His gifts to Madame Du Barry, notwithstanding the embarrassment of the finances, in five years amounted to 180 millions of livres. At last, L., who had for some time suffered from a disease contracted through vice, was seized with small-pox, the infection of which was communicated by a young girl who had been brought to him, and on 10th May 1774 he died, so far from being regretted that his funeral was a sort of popular festival, and was celebrated with pasquils and merry ballads. His death-bed was one of extreme misery. He was succeeded by his grandson, Louis XVI.

LOUIS XVI., AUGUSTE, king of France, born 23d August 1754, was the third son of the Dauphin, Louis, only son of Louis XV. He was styled Duke de Berry, until, by the death of his father and his elder brothers, he became Dauphin. He had a vigorous frame, was fond of hunting and manly exercises, took great pleasure in mechanical labours, and shewed an aptitude for geometry, but none for political science. In the midst of the most corrupt of courts, he grew up temperate, honest, and moral. He was married on 10th May 1770, to Marie Antoinette, the youngest daughter of the Empress Maria Theresa.

When L. ascended the throne, misery and discontentment prevailed throughout France. He had not the vigour and judgment necessary for circumstances full of difficulty, and was conscious of his own weakness. He made Maurepas, an old courtier, his prime minister; but among his ministers were Maleherbes, Turgot, and other men of known patriotism; and his accession was signalled by the remission of some of the most odious taxes, the abolition of the last relics of serfdom, the abolition of the torture in judicial investigations, a reduction of the expenditure of the court, and the foundation of institutions for the benefit of the working-classes. He was, for a time, extremely popular; but deeper reforms were rendered impossible by the opposition of the privileged classes. In June 1777, when the state of the finances seemed nearly desperate, Necker (q. v.) was called to the office of General Director of them, and succeeded in bringing them to a more tolerable condition, without any very radical change; but from the interference of France in the American war of independence, he was obliged to propose the taxation of the privileged classes, hitherto exempted. Their resistance compelled him to resign; and Joly de Fleury succeeded him; but the general discontentment induced the king, in 1783, to appoint Calonne (q. v.) comptroller-general, who found money for a time by borrowing, much to the satisfaction of the courtiers. But the indignation of the people increasing, Calonne found it necessary to recommend the convening of an Assembly of the Notables. On 1st May 1787, the Archbishop Loménie de Brienne became Finance Minister. He obtained from the Notables some concessions and some new taxes. But the parliament of Paris refused to register the edict of taxation, as oppressive to the people; and the extravagance of the court and the queen began to be freely spoken of. The convening of the States-general now began to be demanded from every corner of France. The king registered the edicts in a *lit de justice*, and banished the councillors of parliament to Troyes; but ere long found it necessary to recall them, and experienced from them even a stronger opposition than before. On 8th May 1788, he dissolved all the parliaments, and established a new kind of court (*Cour Plénière*) instead; but this act of despotism set the whole country in flames. Matters became still worse, when on

16th August appeared the famous edict, that the Treasury should cease from all cash payments except to the troops. Brienne was compelled to resign, and Necker again became minister. An Assembly of the States of the kingdom was resolved upon; and by the advice of Necker, who wished a counterpoise to the influence of the nobility, clergy, and court, the Third Estate was called in double number.

The subsequent history of L. is given at length under the head FRANCE. All readers of history are familiar with the melancholy incidents of his life, from the opening of the Assembly of the States (5th May 1789) down to his tragic execution. At ten o'clock in the morning of the 21st of January 1793, he died by the guillotine, in the Place de la Révolution. Great precautions were taken to prevent any rescue. As the executioner bound him, Louis tore himself free, and exclaimed: 'Frenchmen, I die innocent; I pray that my blood come not upon France.' The rolling of drums drowned his voice. Ere the guillotine fell, the Abbé Edgeworth, his confessor, cheered him with the words: 'Son of St Louis, ascend to heaven!'

LOUIS XVII., CHARLES, second son of Louis XVI. of France, born at Versailles, 27th March 1785, received the title of Duke of Normandy, till on the death of his brother in 1789, he became Dauphin. He was a promising boy. In the early days of the Revolution, he was sometimes dressed in the uniform of the National Guard, and decorated with the tricolor, to gratify the populace. After the death of his father, he continued in prison—at first with his mother, but afterwards apart from her—in the Temple, under the charge of a coarse Jacobin shoemaker, named Simon, who treated him with great cruelty, and led him into vicious excesses, so that he became a mere wreck both in mind and body. After the overthrow of the Terrorists, he was—perhaps intentionally—forgotten, and died 9th June 1795. A report spread that he was poisoned, but a commission of physicians examined the body, and declared the report unfounded.

LOUIS XVIII., STANISLAS XAVIER, the next younger brother of Louis XVI., born at Versailles, 17th November 1755, received the title of Count de Provence. In 1771, he married Maria Josephine Louisa, daughter of Victor Amadeus III. of Sardinia. After the accession of Louis XVI. to the throne, he assumed the designation of *Monsieur*, and became an opponent of every salutary measure of the government. He fled from Paris on the same night with the king, and was more fortunate, for, taking the road by Lille, he reached the Belgian frontier in safety. With his brother, the Count d'Artois, he now issued declarations against the revolutionary cause in France, which had a very unfavourable effect on the situation of the king. The two brothers for some time held a sort of court at Coblenz. L. joined the body of 6000 emigrants who accompanied the Prussians across the Rhine in July 1792, and issued a manifesto even more foolish and extravagant than that of the Duke of Brunswick. After the death of his brother, Louis XVI., he proclaimed his nephew King of France, as Louis XVII., and in 1795 himself assumed the title of king. The events of subsequent years compelled him frequently to change his place of abode, removing from one country of Europe to another, till at last, in 1807, he found a refuge in England, and purchased a residence, Hartwell, in Buckinghamshire, where his wife died in 1810, and where he remained till the fall of Napoleon opened the way for him to the French throne. He landed at Calais on 26th April 1814, and entered Paris, after twenty-four years' exile, on 3d May; and the nation received

the constitutional charter from his hands on 4th June. See FRANCE.

The conduct of the government, however, was far from being constitutional or liberal. The nobles and priests exercised an influence over the weak king, which led to severe treatment of the Imperialists, the Republicans, and the Protestants. Then followed Napoleon's return from Elba, when the king and his family fled from Paris, remained at Ghent till after the battle of Waterloo, and returned to France under protection of the Duke of Wellington. He issued from Cambrai a proclamation in which he acknowledged his former errors, and promised a general amnesty to all except traitors. Again, however, he followed in many things the counsels of the party which detested all the fruits of the Revolution. But the Chamber of Deputies, elected with many irregularities, was fanatically royalist, and the king, by advice of the Duke de Richelieu, dissolved it; whereupon arose royalist plots for his dethronement, and the abolition of the charter. Bands of assassins were collected by nobles and priests in the provinces, who slew hundreds of adherents of the Revolution and of Protestants, and years elapsed ere peace and good order were in any measure restored. L. died, 16th September 1824.

LOUIS NAPOLEON, whose full name is CHARLES LOUIS NAPOLEON BONAPARTE, and his titular designation, *Napoléon III., Emperor of the French*, was born at Paris, in the palace of the Tuileries, 20th April 1808. He is the third son of Louis Bonaparte, brother of the first Emperor. See BONAPARTE FAMILY. His birth was celebrated with great rejoicings throughout France, as that of an heir to the imperial throne, for by the law of succession (dated 28th Floreal, year 12, and 5th Frimaire, year 13), the crown, in default of direct descendants of the Emperor himself—and he at that time had none—could be inherited only by the children of two of his brothers, Joseph and Louis. But Joseph was also childless, and the sons of Louis, in consequence, became heirs-apparent. After the restoration of the Bourbons, the ex-queen Hortense, mother of L. N., went into exile, carrying with her her two sons, Napoléon Louis and Louis Napoléon. Since 1810, she had been separated from her husband. L. received his early education in the castle of Arenberg, on the shores of Lake Constance, where his mother resided. He was furnished with the best tutors that could be got, and was far from proving a slothful pupil. At the gymnasium of Augsburg, he displayed quite a passion for history and the exact sciences. His love of athletic sports was equally conspicuous: he was one of the best fencers, riders, and swimmers in the whole school. In Switzerland, his inclination and aptitude for military strategy, especially in artillery and engineering, was first developed. He even served for some time as a volunteer in the federal camp at Thun, and at a later period in his life wrote a *Manuel d'Artillerie* (Zürich, 1836). In 1830, when an insurrection broke out in the pontifical states, L. N. and his brother took part in it. The latter died at Forlì, and L. N. himself fell dangerously ill at Ancona, and was only saved by the tender devotedness of his mother. The Austrian occupation of Ancona forced them to quit the city secretly; they proceeded to France, but their incognito being betrayed, they were expelled by Louis Philippe, after a few days, and crossed over to England, whence they soon returned to Switzerland. Such, however, was the charm of N.'s name, that the chiefs of the Polish insurrection offered him, in 1831, the command of their legions, 'as the nephew of the greatest captain of all ages,' and also the crown of Poland.

The capture of Warsaw by the Russians, however, put a stop to further proceedings in this matter, and L. N. once more turned to his silent and sombre studies. The death (22d July 1832) of the Duke of Reichstadt, sometimes called *Napoléon II.*, only son of the first Emperor, opened the future to his ambitious hopes; and even his supporters admit that, from this date forward, his whole life, speculative and practical, was devoted to the realisation of what now became his 'fixed idea,' viz., that he was destined to be the sovereign of France. Between 1832 and 1836, he published several works, which not only kept him prominently before the French public, but evoked a considerable amount of political and intellectual sympathy. We may mention his *Réveries Politiques*, *Projet de Constitution*, *Deux Mots à M. de Chateaubriand sur la Duchesse de Berri* (in verse), and *Considérations Politiques et Militaires sur la Suisse*. In 1836, believing in the instability of the throne of Louis Philippe, and in the general disaffection of the *bourgeoisie*, encouraged also by the proofs of vivid attachment to his person displayed by nearly the whole of the democratic party, but, above all, confiding in the grandeur of those memories which his name recalled, he, with a few associates, among whom was the Comte de Persigny, since better known, made his famous attempt at a *coup d'état* at Strasbourg. It was, as all the world knows, a ludicrous failure. L. N. was taken prisoner under humiliating circumstances, and after some days conveyed to Paris; but the government of Louis Philippe was afraid to bring a Bonaparte to trial—as in such a case it could not rely upon the impartiality of a French jury—and in consequence shipped him off to America. The illness of his mother soon caused him to return to Europe. He found her dying; two months later, he received her last sighs (3d October 1837). Although the affair of Strasbourg had naturally enough caused many people to doubt the talent and particularly the judgment of L. N., still Louis Philippe, who was, politically speaking, an extremely timid monarch, dreaded some new conspiracy, and, in consequence, the French government demanded of Switzerland the expulsion of the obnoxious prince from its territories, M. Molé actually enjoining the French ambassador to request his passports, in case of a refusal. Switzerland was violently agitated, and was almost on the point of going to war for the distinguished refugee (who was, in fact, a Swiss citizen), when the latter resolved to prevent a rupture by leaving his adopted country. He now proceeded to England, and settled in London. With certain members of the British aristocracy, he came to live on a footing of considerable intimacy, and there can be no doubt that he was also an object of languid wonder and interest to the community generally, but he impressed nobody with a belief in his future and his genius; nay, Englishmen erred so far as to suppose that the 'silent man' was merely 'dull.' In 1838, he published in London his *Idées Napoléoniennes*, which, read in the light of subsequent events, are very significant. Europe generally regarded them as idle dreams; but in France the book went through numerous editions. In 1839, L. N. was in Scotland, and took part in the celebrated Eglinton tournament. Next year (1840), taking advantage of the sentiment aroused by the bringing home of the ashes of his uncle from St Helena, he made another attempt on the throne of France at Boulogne. It was as grotesque a failure as the one at Strasbourg, and undoubtedly provoked a certain feeling of contempt for its author in the mind of the general public. Captured on the shore, while endeavouring to make his escape to the vessel that had brought him from England, L. N. was

again brought to trial, and condemned to perpetual imprisonment in the fortress of Ham. Here he composed several works, *Aux Mânes de l'Empereur*; *Fragmente Historiques*; *Analyses de la Question de Suisse*; *Réponses à M. de Lamartine*; and *Extinction du Paupérisme*, wrote political articles for the democratic journals, and actually took part in editing the *Dictionnaire de la Conversation*, a valuable French encyclopædia. After an imprisonment of more than five years, he made his escape (25th May 1846), by the help of a Dr Conneau, in the disguise of a workman, and gained the Belgian frontier, whence he returned to England. The revolution of February (1848) caused him to hurry back to France, where he professed himself devoted to the views of the Provisional Government; the latter, however, requested him to leave the country. This he promised to do; but being elected deputy for Paris and three other departments, he took his seat in the Constituent Assembly, 13th June 1848. A stormy debate followed, and on the 15th he resigned his seat, and, either from policy or patriotism, left France. Recalled to France in the following September by a quintuple election, he once more appeared in the Assembly, and at once, through the agency of his zealous associates, commenced his candidature for the presidency. The masses were—rightly or wrongly—thoroughly in his favour. Out of seven and a half million of votes, 5,562,834 were recorded for Prince L. N.; General Cavaignac, who was nearest to him, obtaining only 1,469,166. This fact is declared by the partisans of the emperor to be an absolute proof of his popularity, for at this period he had neither power nor money to force or bribe opinion. On the 20th December, he took the oath of allegiance to the republic. For a few days, concord seemed to be re-established between the different political parties in the Assembly; but the beginning of the year 1849 witnessed the commencement of a series of struggles between the president and his friends on the one side, and the majority of the Assembly on the other—the latter being profoundly penetrated with the conviction that L. N. was not devoted to the interests of the republic, but to his own. The French expedition to Italy and the siege of Rome were, above all, the causes of violent discussion in the chambers. This anarchic condition of things, in which, however, the president tenaciously held his ground, was summarily put a stop to by the famous or infamous (for opinions differ) *coup d'état*, 2d December 1851. The principal actors in this midnight deed were the president himself, M. de Morny, M. de Maupas, and General St Arnaud. The circumstances that marked it were of necessity odious, and even atrocious; and there cannot be the shadow of a doubt that it has engendered in the mind of Europe a distrust of the honesty of L. N., which it is not likely will ever be wholly removed. His success was certainly magnificent, but the cost has also been enormous. The feeble attempts at an armed resistance in Paris were put down by the military, who were favourable to the president, and under the command of his accomplices. A rigorous system of repression was put in force both in Paris and in the departments, and the deportation to Cayenne and Algeria became painfully familiar to the European public. France, as a whole, however, whether wearied of the incompetent democrats, or (as Kingslake supposes) 'cowed' by the terrible audacity of the president, appeared to acquiesce in his act; for when the vote was taken upon it on the 20th and 21st of the same month, he was re-elected president for ten years, with all the powers he demanded, by more than 7,000,000 suffrages. His enemies affirm they were obtained

by terrorism, and of course the same value cannot be placed upon this as on the previous expression of national confidence. L. N. was now emperor in fact; nothing was wanting but the name. This was assumed exactly a year after the *coup d'état*, in accordance, as it appeared, with the actual wish of the people. The principal political events of his reign since then have been the conspiracies against him (1853), the attempts at assassination (by Pagan, 1855, and Orsini, 1858), the Anglo-French alliance and the Crimean war (1854–1856), and still more recently the Franco-Italian war (1859), in which the French and Sardinians wrested Lombardy from Austria, and the overthrow of the Mexican republic (1863). On the 30th January 1853, the emperor married Eugénie Marie, Countess of Montijo, a Spanish lady of distinguished beauty; from this union has sprung one child, the prince imperial, born 16th March 1856. Different opinions are entertained in regard to the régime of Louis Napoleon. The apologists of the emperor can, however, point to the immense strides which French trade has made under his rule; to the enlightened principles of commercial intercourse which he has adopted, in spite of the ignorance of his subjects; to the vast extension of railways, the magnificence of the public buildings, and the uniform desire which he has shown to ascertain and carry out the real wishes of the French people.

LOUIS PHILIPPE, King of the French, born at Paris, 6th October 1773, was the eldest son of Louis Philippe Joseph, Duke of Orleans. He received at his birth the title of Duke of Valois, and afterwards that of Duke of Chartres. His education was intrusted to the care of the celebrated Madame de Genlis. He entered the National Guard, and became a member of the Club of Friends of the Constitution, afterwards that of the Jacobins. Along with his father, he renounced his titles, and assumed the surname of Egalité. He showed both courage and capacity in the war; but his situation became very dangerous after the unsuccessful battle of Neerwinden, in which he commanded the centre. He was included in the order for arrest issued against Dumouriez, and on the 4th April 1793 escaped along with him into the Austrian territory. He sought in Switzerland a place of security for his sister Adelaide, wandered about amongst the mountains for four months, and accepted a situation as teacher of geography and mathematics in a school at Reicheman, near Chur, assuming the name of Chabaud-Latour. He afterwards wandered for some time in the north of Europe, and then went to North America. In 1800, he took up his abode at Twickenham, near London, with his two younger brothers, both of whom soon after died. In 1806, he married Marie Amélie, daughter of Ferdinand I. of the Two Sicilies. On the fall of Napoleon, he hastened to Paris, where he was received with distrust by Louis XVIII. After the second Restoration, he recovered his great estates, which the imperial government had sequestrated. Disliked by the court, he was very popular in Paris. He kept aloof, however, from political intrigues; and the three bloody days of the revolution of 1830 were nearly over as he was brought forward, the banker, Laflitte, proposing in the provisional committee his appointment as lieutenant-general of the kingdom, from which he proceeded to the acceptance of a constitutional throne, 9th August 1830. He defended his conduct towards the elder Bourbons by protesting that he acted for the welfare of France. He cultivated peaceful relations with foreign powers, sought to strengthen his throne by gaining the support of the middle classes, and repressed all the extreme parties by what became known as the *Juste-milieu* (q. v.).

LOUIS-D'OR—LOUSE

policy. The extreme democrats hated him, and frequent attempts were made on his life, by *infernal machines* and otherwise. The country prospered under his government, but a demand for reform in the electoral system became loud and general, and was unwisely opposed by the king and the Guizot (q. v.) ministry; whilst the conduct of the former in the matter of the marriages of the queen of Spain and her sister, manifesting a disregard of every consideration but the interests of his own family, excited a strong feeling of indignation throughout Europe. The French nation became much excited; 'reform banquets' began to be held; the government attempted to prevent them by force; insurrectionary movements ensued in the streets of Paris on 23d February 1848; and the 'Citizen King' saw with alarm that the National Guard could not be expected to support him. On 9th February, he abdicated in favour of his grandson, the Count de Paris; but the Chamber of Deputies refused to acknowledge the boy as king. L. P., deserted by his courtiers, fled to the coast of Normandy along with his queen, concealed himself for some days, and at length found opportunity of escaping in a British steam-boat to Newhaven under the name of Mr Smith. The brief remainder of his life was spent in England. He died at Claremont, 29th August 1850.

LOUIS-D'OR (i. e., *Golden Louis*), a gold coin which was introduced into France in 1641, and continued to be coined till 1795. It was introduced in consequence of the prevalent custom of clipping and otherwise defacing the then coins of the realm, from which malpractices it was thought to be in some measure secured by its border. The old coins were called in. The Louis-d'or ranged in value from about 16s. 7d. to 18s. 9d. sterling. Some Louis-d'ors bear special marks, chiefly derived from the figure exhibited on the obverse side.—In some parts of Germany, the larger gold pieces, of five thalers or thereby, are often popularly called *Louis-d'or*, and the name is also occasionally applied to the French Napoleon or 20-franc piece.

LOUISIANA, one of the United States of America, bounded on the south by the Gulf of Mexico, and on the west by the state of Texas. It is 230 miles from east to west, and 200 from north to south, having an area of 41,255 square miles, or 26,423,200 acres. The principal rivers are the Mississippi—which has a course of 300 miles in this state, and whose delta traverses its southern half—Red River and the Washita, and their branches. The principal towns are New Orleans, and Baton Rouge, the capital, on the Mississippi. The coastline, a portion of the shore of the Gulf of Mexico, is 1286 miles in length. The surface is flat, rising nowhere more than 300 feet, and of alluvial formation. A large portion of the state is below the high-water level of the rivers, and is protected by dikes, called *levees*, from inundations. The land is generally of great richness, producing sugar-cane, cotton, rice, maize, tobacco, oranges, bananas, figs, peaches, &c. In the forests are several kinds of oak, hickory, locust, sassafras, mulberry, &c. The state has produced in a year 300,000,000 lbs. of sugar, 200,000 bales of cotton, 10,000,000 bushels of maize. The commerce of the state through New Orleans is very extensive. There are 6 colleges, 149 academies, 664 public schools, 307 churches, 46 periodicals, 10 public libraries. L. was settled by the French in 1699; in 1716, it was granted to John Law, who based upon his grant the famous Mississippi Company; ceded to Spain in 1762; re-ceded to Napoleon I. in 1800; purchased in 1803 by the United States, for 15,000,000 dollars,

and admitted as a state in 1812. Invaded by the British troops in 1814, under General Packenham, New Orleans was successfully defended by General Jackson. The population, largely of French descent, called Creoles, was in 1860, free, 376,280; slave, 332,010—total, 708,290.

LOUISVILLE, a city of Kentucky, United States of America, on the Falls of the Ohio, 130 miles below Cincinnati. It is handsomely built, with broad streets, on a level plain. Main Street is three miles long. The city is supplied with water from the Ohio, and by artesian wells, one of which has a depth of 2086 feet, a three-inch bore, and supplies 330,000 gallons of water in 24 hours, which rises to a height of 170 feet. The court-house cost 1,000,000 dollars. There is a fine custom-house, jail, marine asylums, 8 orphan asylums, 60 churches, 2 synagogues, 5 daily, and 12 weekly papers, 6 pork-packing establishments, employing 1200 men, large hemp and tobacco factories, and a commerce of 100,000,000 dollars per annum. Steamers pass over the rapids of the Ohio at high water, but at other times pass through a canal and locks. Pop. in 1860, 69,740.—It was named L. (1780) in honour of Louis XVI. of France, whose troops were then assisting the Americans in the war of independence.

LOUSE (*Pediculus*), a genus of insects, the type of a very numerous family, which forms the order *Parasita* or *Asophora*. The body is flattened, almost transparent; the segments both of the thorax and abdomen very distinct; the mouth is small and tubular, enclosing a sucker; there are no wings; the legs are short, and are terminated by a claw adapted for taking hold of hairs or feathers. The eyes are simple, one or two on each side of the head. All the species are small, and live parasitically, on human beings, terrestrial mammalia, and birds. They deposit their eggs on hairs or feathers, to

Louse:

A, louse, magnified; B, louse, natural size; C, one of the legs, magnified; D, eggs, magnified; E, eggs, natural size.

which they attach them by a glutinous substance; and they multiply with astonishing rapidity. The young cast their skin several times before they reach their maturity, which in the best known species is said to be about eighteen days after they are hatched, but, from the first, they are very similar to their parents. Animals of different kinds are infested by different species of L. peculiar to them; those which are found on birds exhibiting characters considerably different from those of man and mammalia. The same species is rarely found on different species of animals, unless very nearly allied; but some animals have more than one of these parasites. Three infect the human race: one confined to the head, the *COMMON L.* (*P. capitis*); another, the *BODY L.* (*P. vestimentis* & *corporis*), very similar to it, but of a larger size; a third, the *UMAN L.* (*Phthirus pubis*), sometimes

found in the eyebrows, but more frequently in the pubic region, and chiefly in persons of licentious habits; having the body broader, and other characters considerably different from the other two. The common or head L. is a very common parasite. The symptoms which the bites of these insects produce are a troublesome itching, and a more or less apparent eruption upon the scalp, the eruption being usually accompanied by small incrustations of blood produced by scratching off the epidermis. On examining the head, in addition to the insects, numerous eggs called *nits* are found, which are of a pyriform shape, and adhere firmly to the hairs. In six days, the young escape from the egg; at the age of eighteen days, these are again ready to lay eggs; and the female lays fifty eggs in all; so that the rapid augmentation of these insects is easily accounted for. When only a few lice are present, they may be removed by careful combing, or may be killed by the free application of oil or pomatum to the head; but when they are abundant, the scalp should be sprinkled with the Persian insect-powder (*Pyrethrum caucasicum*), which, according to Küchenmeister, soon kills them, or rubbed with white precipitate ointment, which is the most common remedy in this country.

The body L. causes most irritation on those parts of the skin which correspond with the folds and seams of the clothing about the neck and round the waist where the clothes are fastened to the body. The irritation is of the same character as that caused by the preceding species, and the treatment is similar. It is said that the clothes may be purified by burying them in hay for several weeks, but the safer plan is to destroy them. The irritation caused by the crab L. is greater than that caused by the other species. It may be destroyed by one or two applications of an essential oil (oil of rosemary, for example), or of white precipitate ointment.

Whether the *Pediculus tabescens*, or L. occurring in the *Lousy disease*, is or is not a distinct species, is still an open question. Indeed, the fabulous element enters so largely into most of the recorded cases of this disease—as, for example, when Amatus Lusitanus relates that two slaves were incessantly employed in conveying to the sea in baskets the lice which appeared on the body of their master—that the question is of comparatively little importance.

An interesting question has been raised with regard to the lice infesting human beings, it being alleged, by those who desire to establish the essential diversity of certain races, and particularly by Americans anxious to make out the widest possible difference between the European race and negroes, that the lice found on different races are specifically different. The subject has been examined with great care by Mr Murray of Conland, and with evident impartiality; the result being, as appears from his paper in the *Transactions of the Royal Society of Edinburgh*, 1860—1861, that the differences among these parasites are like those among the races of men themselves, easily observed, but not certainly specific.

LOUTH, a maritime county of the province of Leinster, in Ireland, bounded N. by Armagh and by the Lough of Carlingford, E. by the English Channel, S. by the Boyne and the county of Meath, and W. by Meath and Monaghan. Pop. (1861) 75,140, of whom 69,100 were Roman Catholics, 4998 Protestants of the Established Church, the rest Protestants of other denominations. Its total area is 315 square miles, or 201,434 acres. The surface is flat, with the exception of the lofty range on the north, which stretches east and west, and terminates, at a height of 1935 feet, in Carlingford

Mountain, overlooking the bay of that name. This range consists of a granite nucleus, supporting limestone and clay-slate on its flanks. The soil of the level districts is extremely fertile, and eminently suited for wheat-crops. The total acreage under crop in 1862 was 109,998. The cattle in the same year numbered 29,648; sheep, 45,805; pigs, 13,466. The chief rivers are the Boyne (its boundary on the south), the Fane, the Glyde, and the Dundalk River. The chief towns are Drogheda, Dundalk, and Ardee. The chief occupations are agricultural. L. anciently formed portion of the territory of Oriol or Or-gial, but was occupied by De Courcy, and formed into a county by King John in 1210. It was early apportioned among the military adventurers who accompanied De Courcy and De Lacy; but most of these original settlers have been displaced by later confiscations and apportionments of territory, especially after 1641 and 1690. It abounds with Celtic antiquities, some of which, in the neighbourhood of Dundalk, are of great interest. The ecclesiastical antiquities are very striking. There are two round towers, at Monaster-boycce and at Dromiakin. At Mellifont are the remains of a beautiful abbey. In Drogheda, several ruined abbeys are still visible, as also at Louth and Carlingford. But the most interesting of all the relics of antiquity in L. are the celebrated sculptured crosses of Monaster-boycce, of which the larger is 18 feet in height. The county of L. returns two members to the imperial parliament.

LOUTH, a large market-town and municipal borough of England, in the county of Lincoln, 25 miles east-north-east of the city of that name, on the Ludd. It contains a recently erected mansion house, with a court-house and assembly-room; a beautiful parish church of the latter part of the 14th c., with a rich octangular spire 300 feet in height; and a grammar-school, with an endowed annual income of £620 a year. Iron foundries, tanneries, oil-cake mills, and carpet factories are in operation. By means of the canal, extending between L. and Tetney Haven on the estuary of the Humber, considerable traffic in corn and coal is carried on. Pop. (1861) 10,560.

LOUVAIN (Ger. *Löwen*, Flemish, *Leuven*), a city of Belgium, in the province of Brabant, on the Dyle, 16 miles east-north-east of Brussels. It is of considerable extent, but great part of the ground is occupied with fields and gardens. Pop. 30,765. It was at one time much larger. During the 14th c., when it was the capital of the duchy of Brabant, it contained 200,000 inhabitants, and 4000 cloth manufactories. The citizens, however, endeavouring, in the latter part of the 14th c., to assert their independence, along with those of other towns of Flanders, were defeated; and many of the weavers from whose industry the city had in a great measure derived its wealth and importance, took refuge in England, and thus contributed not a little to the prosperity of that country. L. has never recovered from the blow which it then received. It is not now a place of much manufacturing or commercial activity, but has very large breweries, and some tobacco and lace manufactories, &c. The university, founded in 1426 by Duke John of Brabant, was, in the 16th c., regarded as the greatest in Europe, particularly excelling in the department of Roman Catholic theology. It had more than 6000 students. It was suppressed for some time, in consequence of the French Revolution, but restored by the Dutch government in 1817. The state relinquished it again in 1834, but the Roman Catholic clergy restored it at their own expense in 1835.

It has a large library and a botanic garden. The students in 1850 amounted to 612.

LOUVIERS, a town of France, dep. of Eure, on the navigable river Eure, 60 miles north-west of Paris. It has a cathedral, and celebrated cloth-manufactures, the annual value of which is between three and four million francs. Pop. 10,600.

LOUVOIS, FRANÇOIS MICHEL LETELLIER, MARQUIS DE, the war-minister of Louis XIV., was born in Paris, 18th January 1641. His father was Chancellor and Secretary of State in the war department, and purchased for him the reversion of this office. L. displayed great administrative ability; but his desire of power was insatiable, and he was willing to involve the whole world in the horrors of war, that he himself might be indispensable to the king. His war-policy was also ruthless. He caused the Palatinate to be wasted by fire and sword in 1674. For some time, he was, after the king himself, the most powerful man in France. After the death of Colbert, financial affairs came under his control, and the system of extortion and borrowing which he pursued was amongst the causes of the Revolution. He partially lost favour with the king by counselling him against the marriage with Madame de Maintenon; but afterwards instigated the persecution of the Protestants, and involved France in the long war with the German empire, 1688—1697. In 1689, with the alleged view of securing the confines of the kingdom, he again caused the Palatinate to be desolated. Madame de Maintenon directed the attention of the king to these atrocities, who thereupon forbade the burning of Treves; but L. declared that, to save trouble to the king's conscience, he had already issued orders for reducing that city to ashes. The king, upon hearing this reply, seized the tongs from the chimney, and would have struck his minister with that ready weapon, if Madame de Maintenon had not stepped between. Such scenes were repeated from time to time, and the health of the vain and ambitious minister gave way. He died suddenly, 16th July 1691. Louis is said to have rejoiced at his death.—The first two volumes of an elaborate history of L.'s administration, from original documents in the archives of the Dépôt de la Guerre, by Camille Rousset, appeared in 1862 (Paris, Didier).

LOUVRE (Fr. *l'ouvert*, the opening), an ornamental opening of a turret shape, placed on the

Louvre.

roof, to allow the smoke or foul air to escape from large apartments, such as halls, kitchens, &c. These were particularly required in ancient times, when the fire was placed in the centre of the room, and there was no chimney to carry off the smoke. They are frequently used as ornaments where not required for use, and are then glazed and made into lanterns (q. v.). The sides of the louvre were lined with horizontal overlapped boarding, with a space between the boards, which let out the smoke without

admitting the rain. Hence, this sort of boarding, frequently used for the windows of bell-towers, &c., acquired the name of *louvre-boarding*.

LOVAGE (*Ligusticum*), a genus of plants of the natural order *Umbelliferae*, allied to *Angelica*, the fruit elliptical, each carpel with five sharp somewhat winged ribs, and many vittæ in the interstices.—COMMON L. (*L. officinale*, or *L. Levisticum*) is a native of the south of Europe, with ternate decom-pound leaves, and obovate-wedge-shaped leaflets. It is sometimes cultivated in gardens, and notwithstanding its strong and peculiar odour, is used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and are used to cure flatulency and to excite perspiration. A liqueur called *Lovage* is made from them.—Very similar in appearance and qualities is the only British species, SCOTTISH L. (*L. Scoticum*), a native of the sea-coasts in the northern parts of Britain. It is eaten, both raw and boiled, by the Shetlanders. The flavour is aromatic, but acrid, and very nauseous to many who are unaccustomed to it.

LOVAT, a river of Russia, rises in the Witebsk marshes, and flows through the governments of Pskov and Novgorod into Lake Ilmen. Its total length is 267 miles, and it is navigable for barges of fifty tons as far up as Kholm, more than eighty miles from its mouth.

LOVAT, SIMON FRASER, LORD, was born about the year 1676, and was the second son of Thomas Fraser, fourth son of Hugh, ninth Lord Lovat. His mother was Sybilla, daughter of the chief of the Macleods. The Frasers, a family of Norman origin, had obtained Highland territories, in the county of Inverness, in the 13th c., and had established themselves as the patriarchal chiefs of the Celtic inhabitants within these territories, rather than as landlords, in the feudal acceptance of the term. The first settler—or, more probably, the first who gained renown—was named Simon, and hence his descendants were called sons of Simon, or M'Shime. The descendant here commemorated had little hope of succeeding to the estates and honours, until the prospect opened to him under a settlement by his cousin, Lord Lovat. The succession was not indisputable, but until a much later period in the Highlands, influence with the clan often superseded direct hereditary descent. Simon at an early period gained their hearts. His first adventure was an effort to get forcible possession of the young sister of the late lord, who had more legal claims, as heiress to the Fraser estates. Baffled in this, he, for a reason which has defied all attempts to discover, seized on the widow of the late lord, a lady of the Athole family, and compelled her to marry him. As this was not only a crime, but an offence to a powerful family, Simon could only protect himself from punishment by force, and thus he kept up a petty rebellion for some years. On the accession of Queen Anne, when his opponents became all-powerful, he fled to the continent. He was at the bottom of the affair called the Queens-berry Plot in 1703, in which he professed to reveal the policy of the exiled court, and a plan for a rising in their favour among the Highlanders. On the discovery that he had hoaxed Queensberry and other statesmen, and was playing a deep game of his own, he escaped with difficulty to France. Of the method of his existence there during twelve years, there are only mysterious rumours, by one of which he was reputed to have taken orders as a Romish priest. He had been outlawed for his outrages, and another enjoyed his estates by the letter of the law; but he was still the darling of his clan, and on the breaking out of the insurrection of 1715, they sent a sort of ambassador to bring him over. What followed is remarkable, as shewing that the Highlanders were led by the politics of

their chiefs, not by their own prepossessions. The holder of the estates having joined the insurrection, Simon found it his interest to take the government side. His clan at once left the insurgents; and for this good service he was invested with the estates, not only by the votes of his clan, but by the law. His life, for the ensuing thirty years, was active with local intrigues calculated to strengthen his influence. In the insurrection of 1745, he tried to play a double game—sending forth his clan, under the command of his son, to fight for the Pretender, and deeply plotting for that cause, while he professed to be a loyal subject. He was a special object of the vengeance of the government, and after a trial by his peers, was beheaded on the 8th of April 1747. He was remarkable as a type of that class of Highland chiefs who professed to be led by policy as sovereigns, rather than by the laws of the country or its social system, and who were ashamed of no turpitude, fraud, or violence, if it tended to the aggrandisement of themselves and their clans.

LOVE-APPLE. See **TOMATO**.

LOVE-BIRD (*Psittacula*), a genus of birds of the parrot family (*Psittacidae*), a group of beautiful and very small species, natives of the warm parts of America, of Africa, and Australia. They receive their name from the affection which they manifest towards one another, whether in a wild state or in a cage. An Australian species, about the size of a sparrow, is now common as a cage-bird in Britain. They are lively birds, and fond of being caressed. They feed on the seeds, &c., on which canaries are fed, and are very fond of chickweed and other plants, with seeds ripe or nearly so.—Anatomically, this genus is remarkable in the parrot tribe for having no *furcula* (merrythought bone).

LOVE-FEASTS. See **AGAPE**.

LOVICZ, an ancient town of Poland, on the Bzura, a tributary of the Vistula, 45 miles west-south-west of Warsaw, is mentioned in history as early as 1126. About 1355, it became a favourite residence of the princes of Poland. It has taken a prominent part in the political revolutions of the country. Pop. 5825. Six fairs are held here annually.

LOWE, Sir Hudson, was born at Galway, 28th July 1769. His childhood was spent in the West Indies, where his father held a military appointment. L. returned to England when in his twelfth year. Having entered the army, he served for some time in Corsica, subsequently at Lisbon and in Minorca. On the renewal of the French war, after the Peace of Amiens, he was appointed to the chief military command in the island of Capri. He was here unsuccessful, being obliged to surrender to the French, 16th October 1806. He served for some time in the north of Europe, and in Germany under Blücher. On the 23d August 1815, he was appointed governor of St Helena, with the rank of lieutenant-general. Previous to leaving England, he married, in January 1816, Susan, widow of Colonel William Johnson. He arrived in St Helena on 14th April 1816, Napoleon having been landed there on the 17th October of the previous year. It is impossible to conceive a situation in which the adequate discharge of a public duty more surely involved a heavy amount of private care and public obloquy than that which had fallen to Lowe. Had he for a single hour relaxed the necessary vigilance, his own impeachment and another European war might have been the consequence. On the other hand, the due exercise of this vigilance entailed upon him every kind of annoyance which the peevish and irritable

captive had it in his power to give. Even were it true that he exercised a needless severity in guarding Napoleon, this might readily be excused when we consider how often it must have been utterly impossible for him to know what was unnecessary and what was not, and of how little consequence was the convenience of one man, who had already broken his parole, compared with the security of the whole world. On the death of Bonaparte, L. returned to England, where his eminent services met with a very ungrateful return. In 1825, he was appointed military commander in Ceylon, from whence he returned to England, in order to resist the charges brought against him by O'Meara and others. He died at London in very poor circumstances, in the 65th year of his age, 10th January 1844.

LOWELL, James Russell, an American poet, was born in Boston in 1819. He was educated at Harvard University, and took his degree there. He afterwards devoted himself to legal studies, but does not seem ever to have practised. In 1841, he published a volume of miscellaneous poems, and his *Legend of Brittany* appeared in 1844. In 1845, he published a prose work entitled *Conversations with some of the Old Poets*. His best works are: *A Fall for Critics*, in which the American writers are passed in review, and *The Biglow Papers*, a collection of political poems, racy with Yankee humour and dialect. A second series, full of 'Union' sentiments, was published in 1862. His works are known in England, where they have been republished.

LOWELL, a city of Massachusetts, United States of America, on the Merrimac River, 25 miles north-west of Boston. Here the Pawtucket Falls, of 30 feet, afford water-power for the factories which have given to this town the name of the 'Manchester of America.' The canal is owned by a company, which erected extensive machine-shops, and has built the factories for eleven 'corporations,' manufacturing cotton goods, prints, woollens, carpets, &c., consuming 25,000,000 lbs. of cotton per annum. L. was incorporated in 1826. The operatives were for years gathered from the rural districts fifty or a hundred miles round, and lived in boarding-houses built and owned by the corporations, and kept under strict management. Foreign emigration has brought a large resident manufacturing population. L. has several banks, daily and weekly newspapers, literary institutions, about thirty churches, and extensive educational establishments. Pop. in 1860, 36,827.

LOWESTOFT, a seaport and bathing-place, in the county of Suffolk, is situated on a height sloping gradually to the sea, 25 miles south-east of Norwich. There are here two light-houses, one on the height or cliff, the other to the south of the town, in a lower locality. A profitable fishery is carried on: soles, mackerel, and herrings being caught in great numbers. The harbour of L. is spacious. Ropes and twine are manufactured. Pop. (1851) 10,663. L. is the most easterly town of England.

LOWTH, Robert, D.D., an English prelate, son of the Rev. William Lowth, rector of Buriton, in Hampshire, was born November 27, 1716. He was educated at Winchester School, whence, with a reputation both as a scholar and poet, he passed to New College, Oxford, in 1730. Here he continued to distinguish himself, took his degree of M.A. in 1737, and only four years after, was appointed professor of poetry. In 1750, Bishop Hoadley conferred on him the archdeaconry of Winchester, and in 1753, the rectory of East Woodhay, in Hampshire. During the same year, he published in Latin his excellent *Lectures on Hebrew Poetry* (*De Sacra Poësi*

Hebraeorum Praelectiones Academicæ). It was greatly admired both in England and on the continent, where the celebrated Michaelis republished it with notes and emendations. These were incorporated by L. himself in a second edition, 1763. A new edition was published by Rosenmüller (Leip. 1815). In 1754, L. received from the university of Oxford the degree of D.D., became Prebendary of Durham and Rector of Sedgfield in 1755, a Fellow of the Royal Societies of London and Göttingen in 1765, Bishop of St Davids in 1766, of Oxford a few months after, of London in 1777, and died November 3, 1787. Besides his lectures, his two principal works are *Life of William of Wykeham* (1758) and *Isaiah, a new Translation, with a Preliminary Dissertation, and Notes, Critical, Philological, and Explanatory* (1778; German edition, by Koppe, Göttingen, 1779; third edition in English, 1842); a work rather too elegant and ornate as a version, but of great value as a means of correcting the numerous blunders of the 'Authorised Version,' and of exhibiting how thoroughly literary and artistic is that section of Hebrew poetry which we call prophecy.

LOXODROMIC LINES (Gr. *loxos*, oblique, and *dromos*, course) are curves of double curvature on the surface of a sphere or spheroid, which have the property of cutting all meridians at the same angle. The course of a ship which is sailing in an oblique direction always to one point of the compass, is a loxodromic line, or, in nautical phrase, a *rhumb line*. These lines appear as straight lines on *Mercator's Projection* (see MAP). A ship sailing obliquely to the direction of the north pole (say, two points off) would wind round it in infinite circuits, always approaching nearer, but never reaching it. In this property, as well as in others, the loxodromic line is analogous to the common logarithmic spiral.

LOYOLA, IGNATIUS DE (IGNO LOPEZ DE RECALDE), the youngest son of Bertram de Loyola and Marina Salez de Baldi, was born in the year 1491 at his ancestral castle of Loyola, in the Basque Provinces. After the scant training of that age in letters, he was received as a page in the court of Ferdinand; but the restraint and inactivity of court-life were distasteful to his enthusiastic mind, and, under the auspices of his relative, Don Antonio Manriquez, Duke of Najara, he embraced the profession of arms. The details of his career as a soldier are of little importance in his history, although they display in a very marked way both the excellency and the irregularities of his ardent temperament, thrown undirected among the temptations as well as the duties of a military life. Of his bravery and chivalrous spirit, many remarkable instances are recorded, and one of these proved the turning-point of his career. In the defence of Pampeluna, he was severely wounded in both legs, one being fractured by a cannon-ball, and the other injured by a splinter, and having been taken prisoner by the French, was by them conveyed to his paternal castle of Loyola, where he was doomed to a long and painful confinement. After a very painful operation, the results of which had well-nigh proved fatal, he eventually recovered; and with his returning strength he appears to have resumed his old thoughts and his habitual levity, for, in order to remove a deformity which had resulted from the first setting of his wounded limb, he consented to the painful remedy of having it re-broken in order to be re-set. After this operation, his convalescence was even more slow; and the stock of romances, by which he was wont to relieve the tedium of confinement, having been exhausted, he was thrown upon the only other available reading, that of the *Lives of the Saints*.

The result was what might be expected in so ardent a temperament—the creation of a spiritual enthusiasm equally intense in degree, although in kind very different from that by which he had hitherto been drawn to feats of chivalry. The spiritual glories of St Francis or St Dominic now took, in his aspirations, the place which had been before held by the knights of medieval romance. With souls like his there is no middle course: he threw himself, with all the fire of his temperament, upon the new aspirations which these thoughts engendered. Renouncing the pursuit of arms, and with it all other worldly plans, he tore himself from home and friends, and resolved to prepare himself for the new course which he contemplated by a pilgrimage to Jerusalem. With a view to his immediate preparation for this holy task, he retired in the garb of a beggar to the celebrated monastery of Montserrat, where, on the vigil of the Feast of the Annunciation, in 1522, he hung up his arms, as at once a votive offering significative of his renunciation of the works of the flesh, and an emblem of his entire devotion to the spiritual warfare to which he was from that moment vowed. From Montserrat he set out barefooted on his pilgrimage, the first step of which was a voluntary engagement which he undertook to serve the poor and sick in the hospital of the neighbouring town of Manresa. There his zeal and devotion attracted such notice that he withdrew to a solitary cavern in the vicinity, where he pursued alone his course of self-prescribed austerity, until he was carried back, utterly exhausted, to the hospital in which he had before served. To this physical exhaustion succeeded a state of mental depression, amounting almost to despair, from which, however, he arose with spiritual powers renewed and invigorated by the very struggle. From Manresa he repaired by Barcelona to Rome, whence, after receiving the papal benediction from Adrian VI., he proceeded on foot, and as a mendicant, to Venice, and there embarked for Cyprus and the Holy Land. He would gladly have remained at Jerusalem, and devoted himself to the propagation of the gospel among the infidels; but not being encouraged in this design by the local authorities, he returned to Venice and Barcelona in 1524. Taught by his first failure, he now resolved to prepare himself by study for the work of religious teaching, and with this view, was not ashamed to return, at the age of 33, to the study of the very rudiments of grammar. He followed up these elementary studies by a further course, first at the new university of Alcalá, and afterwards at Salamanca, in both which places, however, he incurred the censure of the authorities by some unauthorised attempts at religious teaching in public, and eventually he was induced to repair to Paris for the completion of the studies thus repeatedly interrupted. Here, again, he continued persistently to struggle on without any resources but those which he drew from the charity of the faithful; and here, again, he returned to the same humble elementary studies. It was while engaged in these studies, and among the companions of them, that he first formed the pious fraternity which resulted in that great organisation which has exercised such influence upon the religious, moral, and social condition of the modern world. From the close of his residence in Paris, L.'s history has been told in the history of his order. See JESUITS. From the date of his election as the first general of his society, he continued to reside in Rome. To him are due not alone in the general spirit, but even in most of their details, all its rules and constitutions; from him also originated several works of general charity and benevolence, the germs of great institutions still maintained in

Rome; but the great source of his influence upon the spiritual interests of the world is his well-known *Exercitia Spiritualia*, of which an account has been already given. He died at Rome, it may well be believed, prematurely, being worn out by his long-continued austerities, July 31, 1556. His name was admitted to what is known in the Church of Rome as the preliminary step of beatification, in the year 1609, and he was solemnly canonised as a saint by Gregory XV. in 1622. His life has been written in almost every European language. The biographies of Ribadaneira, of Maffei, of Bartoli, and Bouhours are the best known and the most popular among Roman Catholics.

LOZENGE, in Heraldry, a charge generally enumerated among the sub-ordinaries, in the shape of a rhombus placed with the acute angles at top and bottom. The horizontal diameter must be at least equal to the sides, otherwise, it is not a lozenge, but a Fusil (q. v.) The term *lozenge* is applied

to a field divided by diagonal lines crossing one another at regular intervals, so as to form a diamond pattern, the compartments being of alternate tinctures.

LOZENGES are employed in medical practice in those cases in which it is desired that the remedy should pass gradually into the stomach, in order to act as much and as long as possible upon the pharynx and the laryngeal opening; as, for example, in cases of relaxed or inflamed states of the tonsils and uvula, in chronic coughs, &c. According to Dr Paris (*Pharmacologia*, 9th ed. p. 555), lozenges should be composed of several demulcent substances, such as farinaceous matter, sugar, gum, and isinglass, since such a mixture retards as long as possible their solution. Lozenges are flat and circular or oval in form, and the chief difference between lozenges and the closely allied substances known as *drops*, is, that in the latter the sugar is rendered fluid by means of heat, while in the former the ingredients are combined without the aid of heat.

LOZÈRE, a département in the south of France, derives its name from Mount Lozère, one of the summits of the Cévennes (q. v.), and is formed out of the province of Languedoc. It comprises the arrondissements of Mende, Florac, and Marvejols. Area, 1,276,756; pop. (1862) 137,367, among whom are many Protestants. The département is mountainous, the central mass of the Cévennes, here called the Margeride Mountains, occupying the whole of the east and south-east portions. In the mountains, the climate is severe and variable, and little grain is produced; but the slopes on the southern side of the Cévennes, looking towards the valley of the Rhone, are clothed with the mulberry, the olive, and the vine. Wolves abound in the forests, which are extensive. Cattle, sheep, and mules are reared and exported in considerable numbers; but the real prosperity of the département arises from its mines, which yield iron, antimony, lead, copper, silver, and some gold. Capital, Mende.

LÜBECK, one of the four remaining free cities of Germany, is situated on the river Trave, about 40 miles north-east of Hamburg, and 14 from the Baltic. It is built on a rising ground, and its appearance with its walls and ramparts still partly standing, its great gates, its proud towers, its Gothic churches, and its antique gabled houses is still almost medieval. Its principal buildings are St Mary's Church (*Die Marienkirche*), one of the most beautiful

specimens of Gothic architecture in the north of Europe, finished in 1304, with three naves, the central one 119 feet in length, and two towers, 332 feet high; the town-house, containing the Hanseatic archives and a public library of 50,000 volumes, built of red and black glazed tiles; the cathedral, built 1170—1341; the monastery church, also a masterpiece of Gothic; the exchange, and the banks. L. is rich in educational establishments of all kinds, religious and secular—the number within the city amounting to 54, while in the suburbs there are no less than 37, in all 91. The provision for the poor is excellent, on account of the large bequests that citizens have made at different periods for this purpose, the largest benevolent institution being the Hospital of the Holy Ghost. The industrial activity of L. is considerable. Ship-building and engineering are carried on; there are also about 60 breweries and important cigar-manufactories; yet in the old days when the Hanseatic League was flourishing, the Merchant Company or College could reckon 5000 members, while in 1859 it had only 471. In 1860, 1134 ships (of which more than 300 were steamers) entered the harbour, and 1151 cleared, of which about 60 belong to the Lübeckers themselves. The chief imports are wine, silks, cottons, earthenware, pigments, colonial products, and timber from Sweden and Finland; the chief exports are grain, cattle, iron, and wool. The harbour lies 16 or 17 miles down the river, at Travemünde, a bathing-place, although the river has of late years been so much deepened, that the largest ships can come up to Lübeck. Pop. of town and suburbs (in 1857), 30,717; of the scattered spots of territory in the duchy of Holstein, under the jurisdiction of L. 18,765. In 1860, both its revenue and expenditure amounted to £88,847.

L. has existed since the 11th c., and received important privileges from the German emperors in the 12th c., which were confirmed by the Danes, into whose power it fell in 1201. It was declared a free city of the empire in 1226, and thereafter maintained its independence against the Danes, and joined the other commercial towns in the great Hanseatic League (q. v.). With the decline of the Hanseatic League, L. lost its historic importance, but continued a flourishing and independent commercial city, till it was taken and plundered by the French, November 6, 1806. Its trade suffered also grievously from the French Continental System. In 1810 it was incorporated with the French empire. It recovered its independence in 1813, and is now a member of the Germanic Confederacy. Its trade has also revived; and the railway connection with Hamburg, and lines of steamers to ports of the Baltic, have contributed much to the increase of its prosperity.

Constitution.—The constitution, which was anciently aristocratic, has been democratic since 1669. The government is intrusted to a senate, which consisted, till 1851, of twenty members; but since that year, of only fourteen, who, in legislative and also in certain administrative functions, require the concurrence of the municipality or council of citizens, a body comprising 120 members. The supreme court of appeal for the free cities is in L., and Lübeck Law (*Lübisches Recht*) is of acknowledged authority in many questions.

LUBLIN, the capital of the Polish government of the same name, on the left bank of the Vistula, a feeder of the Wieprz, a branch of the Vistula, is 96 miles south-east of Warsaw. L. dates from the 10th c., and among the objects of interest which it presents to tourists, the church of St Nicholas (founded in 986 A.D.) and the ruins of a royal castle are worth notice. It was formerly

fortified. The chief buildings are the town-hall, the Sobieski palace, cathedral, Jews' synagogue, Friarist college, and several schools and hospitals. It has several manufactories of woollen and linen goods, in which, as well as in corn and Hungarian wine, it carries on an extensive trade. Pop. 19,054. Three large fairs, each lasting one month, are held here annually.

LUCANUS, **M. ANNÆUS**, the chief Roman poet of the Silver Age, was born at Corduba (the modern *Cordova*), in Spain, 38 A.D., and brought to Rome in his infancy by his father, who was a younger brother of the philosopher Seneca. He received an education of the best kind, was a school-fellow of Persius, and a friend of the Emperor Nero, and entered on life with the most brilliant prospects. He became quaestor and augur, and declaimed and recited in public with the highest applause. But his prosperity and himself were equally short-lived. He lost the favour of Nero, who was jealous of his poetry and his fame, and who desired to keep down both. Under the sting of this annoyance, he joined the conspiracy against Nero's life in 65 A.D. It is painful to read in Tacitus, that when arrested with others after the betrayal of the plot, he tried to save his life by accusing his mother of complicity. But the emperor did not spare him for the sake of this additional crime; he was compelled to destroy himself by having his veins opened, and he died in this way, and with a certain ambitious composure, at 27 years of age. Whatever the faults of L.'s character—and in the brief notices we have of him, both his vanity and levity are apparent—he holds a conspicuous place among the poets of Rome. The only work of his that has come down is the *Pharsalia*, an epic, in 10 books, on the civil war between Caesar and Pompey. As an epic, it is, as Niebuhr somewhat quaintly says, an 'unfortunate' performance, for it proceeds in the manner of annals, and wants the comprehensiveness, unity, and learning of the greatest works of its class. Nor is its style, generally speaking, good, for it is often turgid and obscure, and marked with those defects of taste which belong to poems inspired by a rhetorical age and school of writing. But when every deduction has been made, the *Pharsalia* affords ample proof that L. was a man of real and powerful genius. There is an eye for the sublime both in the moral and physical worlds, constantly present in it; there is all the vigour of poetic oratory in its declamations; and there are felicities of epigram which have secured to many a line a constant freshness of life, as part of the familiarly remembered literature of the world. L. was very popular in the middle ages; and in modern times, his poem has been a particular favourite among the lovers of political freedom—especially among that school of classical republicans now nearly extinct in Europe, after having played a most important part in it. There is a well-known English translation of L. by Rowe, which Dr Johnson thought one of the best translations in the language.

LUCANUS and **LUCANIDÆ**. See **STAG BENTLE**.

LUCARIS, **CYRIL**, a Greek theologian, was born in the island of Candia in 1572, studied first at Venice, and afterwards at Padua, and subsequently visited Germany, where he formed intimate relations with the Protestant doctors, and carried back into Greece their spirit and their dogmas. Ordained a priest, he rose, in the course of years, to the highest dignity in the Greek Church, being elected Patriarch of Constantinople in 1621. He still cherished his Protestant opinions, and endeavoured even to promulgate them in the church over which

he ruled; but his conduct excited violent opposition among the clergy, and L. was in consequence banished to Rhodes. Through the influence of the English ambassador, however, he was soon reinstated in his office. Unluckily, a confession of faith he had got printed, quite heretical—i.e., Protestant—in its character, fell into the hands of his adversaries, and he was once more involved in difficulties. In 1636, he was banished to the isle of Tenedos, and though recalled after a few months, in June 1637 he was seized in Constantinople, hurried on board a vessel, and it was never properly ascertained what became of him. According to some, he was strangled in the ship which bore him off; according to others, he suffered this fate in a castle on the shores of the Black Sea. His doctrines have been repeatedly condemned by Greek synods.

LU'CARNE, a Dormer Window (q. v.). The name *lucarne* is generally applied to the small dormers in church spires.

LU'COA, **DUCHY OF**, formerly a small independent state, now a province of Central Italy, was bounded on the N. by Modena, on the E. and S. by Tuscany, and on the W. by the Gulfs of Genoa and Massa. Area, 512 square miles; pop. 264,478. The surface of the country is very diversified; the largest stream is the Serchio. L. is famed for the extreme fertility of its soil, and the superiority of its agriculture, which serves as a model to the whole Italian peninsula. The principal products are grapes, olives, grain, mulberries, cheanuts, and vegetables. The marshy flats on the coast afford excellent pastures for cattle. The manufactures are silks, oil (esteemed the best in Italy), glass, paper, linens, cottons, &c.; the principal export is oil. The Lucchesi are a frugal, shrewd race; numbers leave home in search of employment, and they form a large proportion of the itinerant figure-venders, organ-grinders, and stucco-workers of Europe.

L. (anciently called *Luca*) was made a Roman colony in 177 B.C. It was erected into a duchy by the Lombards, and recovered its liberty in 1055, when the chief town, Lucca, became a free city. In 1327 it was a duchy, and was ruled by the celebrated Castruccio Castracani. In 1370 it became an independent republic, was erected into a principality in 1805 by Napoleon, for his sister Elisa Bacciochi, and passed to Maria Louisa of Spain in 1815. Her son, Duke Carlo Luigi, ceded it to Tuscany in 1847, on obtaining possession of Parma and Piacenza; and in 1860 it was annexed to Sardinia. It now forms one of the Tuscan provinces in the new kingdom of Italy.

LUCCA, chief town of the Italian province of Lucca, is situated in a fine plain, bounded by picturesque hills, and irrigated by the Serchio, 12 miles north-east of Pisa. Pop. 22,536. The commercial activity of its inhabitants obtained for it the name of 'Lucca l'Industriosa.' Its great trade is in olive-oil and silk, and it was the first place in Italy where the production and manufacture of silk were successfully introduced. The town is surrounded by ramparts, which form a delightful promenade, and command a fine view of the whole valley of the Serchio; the streets are mostly narrow and crooked, but well paved; the private dwellings are commodious, and the public edifices numerous and interesting. The cathedral contains several fine paintings. A splendid aqueduct, planned during the reign of the Princess Elisa Bonaparte, and executed later, supplies the town with water, and is highly deserving of inspection. The environs of L. abound in delightful villas. In a charming valley, 15 miles from the town, are situated the famous mineral baths of

Lucca, whose temperature varies from 96° to 136° F. The waters are exported to all parts of Italy.

LUCENA, a town of Spain, province of Cordova, and 40 miles south of the city of that name, is picturesquely situated between two hills. Pop. 13,100. The neighbouring territory is famous for its apricots and its breed of horses. L. is historically interesting, as the scene of the capture (April 21, 1483) of Boabdil, king of Granada.

LUCERA (ancient *Luceria*), a town of Italy, in the Neapolitan province of Capitanata, is situated on an eminence 10 miles west-north-west of Foggia. It contains a college, a good museum, a cathedral, and a splendid episcopal palace. A large trade in cheese and cattle is carried on by the inhabitants. Pop. 13,464. Numerous inscriptions and fragments of ancient sculpture have been found here.

LUCERNE, a canton in the centre of Switzerland, with an area of about 474 square miles, and a population (in 1860) of 130,504, shewing a slight decrease since 1850. The soil is generally fruitful, and much grain and fruit are produced. In the more mountainous parts, the rearing of cattle is carried on to a greater extent than anywhere else in Switzerland. The highest elevation attained by the Alps in this canton is 6900 feet. The principal stream is the Reuss, the principal lake that of Lucerne. The inhabitants are mostly of German race and language, and all belong to the Roman Catholic Church, except about 1600 Protestants, to whom the free exercise of their religion was first accorded in 1828. The constitution of L. is a representative democracy; 100 deputies form the Great Council, whose president bears the title of *Schultheiss* (Judge).

LUCERNE, capital of the canton of the same name, is situated on the Reuss, where it issues from the north-west extremity of the Lake of Lucerne. Near the lake, rising from the middle of the Reuss, is an old tower, which is said to have been once a light-house (*Lucerna*), whence the name of the town. The arsenal is one of the most important in Switzerland, containing many old weapons used at the battle of Sempach. L. has a theatre, a public library, with a collection of natural history, manufactures of silks, cottons, flax, hemp, gloves, &c. Pop. (1860) 11,522.

LUCERNE, LAKE OF, called also the *Lake of the Four Forest Cantons* (Uri, Unterwalden, Schwyz, and Lucerne), because its shores are formed by these, is one of the most beautiful sheets of fresh-water in Switzerland or Europe. Length from Lucerne to Flüelen, about 22 miles; average breadth, about 1½ mile. The chief places on its banks are Lucerne, Küssnacht, and Alpnach, at the north-west, and Flüelen near its south-west extremity. It is navigated by several steam-boats.

LUCERNE (*Medicago sativa*), a species of Medick (q. v.), one of the most valuable of the leguminous plants cultivated for the supply of green food to cattle. It is a native of the south of Europe, and has been cultivated there from an unknown antiquity. It is partially naturalised in some parts of Britain. It is not very largely cultivated in Britain, although in some places very successfully, chiefly in the south of England; but the climate of Scotland is not too cold for it, and the different results obtained by farmers who have tried it seem to depend chiefly on differences of soil and management. It is largely cultivated in some parts of North and South America, and in Peru with great success both on the coast, in all the heat of a tropical climate, and on the mountains to a height

of more than 11,000 feet above the sea; flourishing, however, only during the moister part of the year in the former situation. It endures great drought, its roots penetrating very deep into the ground; but loves a rich and calcareous soil, and never succeeds on damp soils or tenacious clays. It is a perennial, and affords good crops for a number of years. It is sown in rows, at 12 or 14 inches apart, and may be mown several times in a year, growing very quickly after being mown. The quantity of produce is very great, and no other forage-plant is ready for use so early in spring. L. has a rather erect stem, leaves with three obovate-oblong toothed leaflets; purplish blue or sometimes yellow flowers in many-flowered racemes, and pods twisted two or three times round. It ought to be mown before it comes into flower, as it then becomes more fibrous, and less succulent and nutritious.

LUOLA, St., one of the windward division of the Caribbees (see **LEeward ISLANDS**), lies about 30 miles to the south of Martinique, having its southern extremity in lat. 13° 41' N., and long. 61° W. The island is of volcanic origin, and the crater of the *Soufriere*, or *Sulphur Mountain*, is still in energetic operation. St L. is remarkable for its picturesque and romantic scenery. Much of the surface is covered with hills, generally well wooded, and occasionally rising to the height of nearly 3000 feet. Area, 300 square miles, or 192,000 acres, of which, in 1860, 9026 acres were under crops; pop. (1860) 27,141, of whom only 720 were whites. As the coast abounds in secure, commodious, and defensible harbours—all the more valuable from their comparative scarcity in the neighbourhood—the island has been, perhaps, to an unexampled extent, an object of contention between France and England. In the hands of the latter, however, it has remained since 1803. From official returns for 1860, are drawn the following statistics. The island contained 18 schools, attended by 1470 scholars. Its revenue was £13,603; its expenditure, £12,151; its public debt, £18,000. 396 vessels, of 25,212 tons, entered and cleared its ports. The imports amounted to £97,900, and the exports to £105,947. The principal exports were 7,968,165 lbs. of sugar, 212,482 lbs. of cocoa, 29,221 gallons of rum, and 122,400 gallons of molasses.

LUCIAN, a classic satirist and humorist of the first merit, was born at Samosata, in Syria, in the earlier part of the 2d c., though the exact year is matter of conjecture. He himself tells us, in a piece called *The Dream*, that his parents were poor, and could not afford him a learned education. He was, in consequence, apprenticed to an uncle who was a statuary, in order that he might learn that trade; but he soon abandoned it, and betook himself to the study of letters. For a long time he led a somewhat vagrant and unsettled life, visiting the most of Greece, Italy, and Gaul, in the last of which countries he practised with great success as a teacher of rhetoric. He is thought to have returned to his native country when about forty years of age, after which time all his master-pieces were composed. The last thing we know about him is, that he was made a procurator of part of Egypt by the Emperor Commodus. He died probably about the end of the 2d century. The statement of Suidas, that L. was torn to pieces by mad dogs on account of his impiety, finds no credence with modern scholars; neither does that of Volaterranus, that he was an apostate from Christianity. The dialogue entitled *Philopatria*, long attributed to L., certainly shews an intimate knowledge of Christianity; but so critic now believes it to be a production of

that writer. The fact is, L. was one of that class of men who do not readily embrace any form of religion—men whose sharp critical eyes see too many flaws to make it easy for them to acquire a pious or reverential spirit. In philosophy, as well as in religion, he called no man master. Philosophers are indeed the constant subjects of his humorous ridicule and pungent wit, aided by all the resources of a richly inventive fancy. His writings have been classified under seven heads. 1. The Rhetorical; 2. The Critical; 3. The Biographical; 4. Romances; 5. Dialogues; 6. Miscellaneous; 7. Poems. Of these, the most celebrated are his Dialogues, the principal of which are—*The Sale of Lives; Dialogues of the Gods; The Fisherman, or the Revivified; The Banquet, or the Lappiths; Timon the Misanthrope; Dialogues of the Dead; and Icaro-Memippos, or Above the Clouds*. The best of his romances, and a work of Rabelaisian humour, is his *True Historica*. The *editio princeps* of L. appeared at Florence in 1496; the best of the later editions is that commenced by Hemsterhuis in 1730, and finished by Reitz (Amst. 1743). L. has always been a great favourite with scholars, and has been translated into most of the European languages. The best English version (incomplete however) is that of Dr Franklin (2 vols. Lond. 1780, and 4 vols. Lond. 1781).

LUCID INTERVAL. What intermission is to certain fevers, a lucid interval is to certain forms of mental disease. Those forms in which it occurs are characterised by exaltation or perversion, and not by impairment of the faculties or feelings. There may thus be a cessation or suspension of the fury in mania; there cannot be repair or enlightenment of the obscurity in idiocy or senile dementia. It may consist in the mere substitution of clearness and calmness for violence and confusion; in the occasional recognition of his actual condition and external relations by the lunatic; or in the re-establishment of intelligence and natural feeling so perfect and complete as to differ from sanity solely in the want of permanence. The duration is likewise sometimes so considerable and regular as to divide the mental and moral life of the individual into two halves. It has been believed that even in such cases the interval is a part or link of the disease, and that there invariably exists an under-current of unsoundness. It is found to be extremely difficult to distinguish this state from real and trustworthy restoration to reason, except by reference to duration. Practically and legally, these conditions have been held to be identical. A will executed during a lucid interval, although that was extremely transitory, and although the testatrix unloosed the straps by which her hands had been confined, in order to execute the document, has been held to be valid; all that appears to be required, under such circumstances, is to prove that the conduct of the individual bore the aspect of rationality and health. It has been observed that, immediately before death, a small proportion of the insane regain lucidity, and, after years of extravagance and absurdity, die in possession of comparative sense and serenity. This change is supposed to depend upon the failing powers of the circulation.—Burrows, *On Insanity*; Sheldford, *On Laws of Lunatics*, p. 289.

LUCIFER MATCHES. See MATCHES.

LUCINA, a genus, and **LUCINIDÆ**, a family of Lamellibranchiate mollusca, allied to *Veneride* (see *Venus*). The shell is orbicular, or nearly so, and bears a very long impression of the anterior muscle. The animal has a long, generally cylindrical foot. The species are numerous, are found in almost all

seas, and at all depths in which life is known to exist, burrowing in the sand or mud. There are also many fossil species in the more recent formations.

LUCKENWALDE, a town of Prussia, government of Potsdam, and capital of a circle of the same name, is situated on the river Nuthe, 30 miles south-south-west of Berlin. Pop. 8513. One of its suburbs, called Little Gera, is inhabited by Russian colonists. Its cloth manufactories are among the largest in Prussia. L. is a station on the Berlin and Anhalt Railway.

LUCKNOW, the capital of Oude, in British India, stands on the right or south-west bank of the Gumti, by which it has a navigable communication upwards for many miles, and downwards all the way to the Ganges. It is in lat. 26° 52' N., and long. 81° E., is 360 feet above the sea, and is 610 miles from Calcutta. The place is connected with the opposite side of the river by three bridges, one of stone, another of boats, and a third of iron. Though L. does not appear to contain any very ancient buildings, it is yet understood to be older than any one of the other great cities of India, claiming to have been founded by Lakshmana, brother of Rama. The middle portion, which may be said to represent the original town, contains, with the exception of a few brick-houses, little but mud walls and straw roofs. On either side of these central hovels are the handsomer sections of L., generally dating, however, no further back than 1775. The population has been estimated at 300,000. As an illustration at once of manners and of government, all classes, down to the annexation of Oude in 1856, were wont to go fully armed, the very shopkeepers being equipped with swords and shields. In connection with the mutiny of 1857, L. stood foremost in point of interest, surpassing every spot in the energy and obstinacy of its defence against the insurgents, and almost equalling Delhi itself in the grandeur and brilliancy of the operations, which recovered it, after a temporary abandonment, from the rebels.

LUCRETIIUS, TITUS CARUS. Of the life of L. we know almost nothing with certainty, as he is mentioned merely in a cursory manner in contemporary literature. Hieronymus (340—420 A.D.), in his translation of the Chronicle of Eusebius (264—340 A.D.), gives the date of his birth as 95 B.C. (according to others, 99); but he does not specify the source from which his statement is derived. It is alleged, further, that he died by his own hand, in the 44th year of his age, having been driven frantic by a love-potion which had been administered to him; that he composed his works in the intervals of his madness; and that these works were revised by Cicero. Donatus (Life of Virgil), on the contrary, affirms that his death occurred in 55 B.C., on the very day on which Virgil assumed the *toga virilis*. The stories of the philtre, the madness, the suicide, and the revision of the works by Cicero, rest on very insufficient authority, and must be received with extreme caution. The peculiar opinions advanced by L. would render him specially obnoxious to the early Christians, and it is possible that the latter may have been too easily led to attribute to him a fate which, in its mysterious nature and melancholy termination, was deemed but a due reward for the bold and impious character of his teachings. The great work on which the fame of L. rests is that entitled *De Rerum Natura*, a philosophical didactic poem in six books. It is dedicated to C. Memmius Gemellus, and was published about 56 B.C. L. was a reverent follower of the doctrines of Epicurus (q.v.), and his poem is in large measure an exposition of the

physical, moral, and religious tenets of that philosopher. The great aim of the poet was to free his fellow-countrymen from the trammels of superstition, and to raise them above the passions and the weaknesses of our natural condition. With his master, Epicurus, L. adopted the atomic theory of Leucippus, which taught that certain elementary particles, existing from all eternity, and governed by fixed laws, combined to form the universe of matter; that the existence and active interference of a supreme overruling deity was not necessary to be supposed in order to account for the marvelous and abnormal in nature; and that whatever appeared to be miraculous, was in reality not so, but was merely the result of certain fixed laws, which operated with unerring precision, and in a natural process. Regarded merely as a literary composition, the work of L. stands unrivalled among didactic poems. The clearness and fulness with which the most minute facts of physical science, and the most subtle philosophical speculations, are unfolded and explained; the life and interest which are thrown into discussions in themselves repulsive to the bulk of mankind; the beauty, richness, and variety of the episodes which are interwoven with the subject-matter of the poem, combined with the majestic verse in which the whole is clothed, render the *De Rerum Natura*, as a work of art, one of the most perfect which antiquity has bequeathed to us. For a fuller estimate of L. and his poetry, see Professor Sellars's essay in *The Roman Poets of the Republic* (Edin. 1863). The *editio princeps* of L. was published at Brescia about 1473; only three copies are known to exist. The best editions of L. are by Wakefield (Lond. 1796, 3 vols. 4to, and Glas. 1813, 4 vols. 8vo); by Forbiger (Leip. 1828, 12mo); and by Lachmann (Berlin, 1850, 2 vols.). The *De Rerum Natura* has been translated into English verse by Thomas Creech (Lond. 1714, 2 vols. 8vo); and by John Mason Good (Lond. 1805—1807, 2 vols. 4to); into English prose by the Rev. J. S. Watson, M.A. (Lond. Bohn's Classical Library, 1851, post 8vo). To this last the poetical version of Good is appended.

LUCULLUS, L. LICINIUS, a very distinguished Roman general, born, it is conjectured, about 110 B.C. In the first Mithridatic war, he commanded the fleet as legate of Sulla. In 77 B.C., he filled the office of prætor, and immediately after, held the administration of the province of Africa. In 74 B.C., he was chosen consul along with Marcus Aurelius Cotta, and got Cilicia for his province, whilst Cotta had Bithynia. Both consuls arrived in Asia about the close of 74 B.C. Cotta was soon after utterly defeated by Mithridates, who had burst into Bithynia at the head of 150,000 troops, forced to take refuge in Chalcedon, and there was besieged by the victor. L., however, advanced to his relief at the head of 35,000 men, compelled Mithridates to raise the siege, and almost annihilated his army on its retreat. In 71 B.C. Pontus became subject to the Romans. The measures which L. now introduced in the government of the province of Asia, to secure the provincials against the fearful oppressions and extortions of farmers of the taxes and usurers, especially his fixing a uniform and moderate rate of interest for all arrears, shew that he was a just, wise, and humane administrator; but though the cities of Asia were grateful for his clemency, the equestrian order in Rome (who had the farming of the taxes) became implacably hostile to him, and his own troops grew disaffected on account of the strictness of his discipline. For some time, however, things seemed to go on well enough. In the spring of 69 B.C., he marched into Armenia with a small force of 12,000 foot and 3000

horse, and gained a complete victory over Tigranes, at the head of an army of 220,000 men. In the following year, he gained another great victory at the river Arsianias over a new army led against him by Tigranes and Mithridates; but the mutinous spirit of the legions—in spite of these splendid triumphs—daily increased. L. now wanted to besiege Artaxata, the capital of Armenia, but the soldiers refused to advance further. After this he could do nothing; not a soldier would serve under him. At last, he was superseded by Pompey, and left Asia 66 B.C. The cabals of his enemies so much prevailed against him, that he was three years in Rome before he obtained his triumph. In conjunction with the aristocratical party, he attempted to check the increasing power of Pompey, and the attempt caused the coalition known as the first triumvirate. But he was ill fitted to act as leader against such unscrupulous men, and soon withdrew altogether from political affairs. During his public career, he had acquired (but not unfairly) prodigious wealth; and he spent the remainder of his life surrounded by artists, poets, and philosophers, and exhibiting in his villas at Tusculum and Neapolis, and in his house and gardens at Rome, a luxury and splendour which became proverbial. A single supper—on particularly grand occasions—would cost him 50,000 denarii (£1770). Towards the close of his life, his faculties began to decay, and his property was placed under the management of his brother. He died about 57 B.C. L. was a man of great military talent, humanity, liberality, and love of justice; his great fault was his love of pleasure; not exactly vicious pleasure, for he was an epicure rather than a profligate; yet so purely sensual, that it seems to have made people—certainly his soldiers—believe him to be grossly selfish and unsympathetic.

LUDLOW, a municipal and parliamentary borough of England, in the county of Salop, at the confluence of the Corve and Teme, 25 miles south-south-east of Shrewsbury. It is an old and very interesting town; its parish church dates from the reign of Edward III.; its free school, founded by Edward IV., has an annual income of £350. The castle, now a magnificent ruin, was at one time one of the most important strongholds against the Welsh. Here Arthur, eldest son of Henry VII., celebrated his marriage with Catharine of Aragon, afterwards the wife of Henry VIII.; and here, in 1634, Milton's masque of *Comus* was performed for the first time. Since the reign of Edward IV., two members have been returned to parliament for the borough. Pop. (1861) of parliamentary borough, 6033.

LUDLOW FORMATION, the uppermost division of the Silurian Strata (q. v.), consists of an extensive series of indurated argillaceous beds, with bands of dark-gray argillaceous limestone. The town of Ludlow stands upon the higher strata of this formation.

LUDWIG I., KARL AUGUST, King of Bavaria, the eldest son of King Maximilian Joseph, born 25th August 1786. In 1810, he married the Princess Theresa of Saxe-Hildburghausen. As crown-prince, he took little part in politics, but devoted himself to science and the fine arts, and lived very economically, in order that he might be able to spend large sums in forming a magnificent collection of masterpieces of sculpture, known as the Glyptothek. He succeeded to the throne on 13th October 1825, and commenced his reign by granting some reforms. His reign was distinguished by the encouragement of the fine arts, and the erection of magnificent public buildings; he also inaugurated the first railway

that Germany possessed—that from Nuremberg to Furth—and executed the fine canal, called *Ludwigskanal*, which unites the Danube and the Main. But it was no less characterised by the prevalence of ultramontane influence, intolerance towards all who did not belong to the Church of Rome, and contempt of constitutional rights and forms, whilst the king's conduct gave great occasion of scandal, particularly in his connection with the dancer Lola Montez (created Countess of Landsfeld). On account of the revolutionary disturbances in February and March 1848, L. resigned the crown in favour of his eldest son, Maximilian.

LUDWIGSBURG, a town of Württemberg, about 8 miles north of Stuttgart. It was founded in 1706 by Duke Eberhard Ludwig, in consequence of a quarrel with the Stutgarters, and is the second royal residence. L. was laid out with painful regularity, and has an artificial and lifeless look. It is the principal dépôt for soldiers in Württemberg, not less than 4000 being stationed here, whence it has got the name of the Swabian Potsdam, and has an arsenal, a cannon-foundry, a military academy, and a royal castle, with splendid picture-gallery and gardens. Pop., including military, 10,979.

LUFF, in Nautical parlance, is to bring a ship's head to the wind, preparatory to tacking, or otherwise. The *luff* of a vessel is the roundest part of her bow.

LUGANO, a town in the canton of Ticino, Switzerland, stands on the north-west shore of the lake of the same name. It is entirely Italian in character, with dingy and dirty arcaded streets; but its environs display all the richness of Italian scenery. L. contains several factories for throwing silk, and is the seat of a flourishing transit trade between Switzerland and Italy. From *Monte Salva-dore*, in the vicinity, a magnificent view may be obtained. Pop. 5140.

LUGANO, LAKE OF, is situated in the south of the canton of Ticino, Switzerland, three of its arms reaching into the Italian territory. Its greatest length is about 20 miles; but from its exceedingly irregular shape, it is nowhere more than $1\frac{1}{2}$ mile broad. The character of its scenery, though perhaps as beautiful, is more rugged than that of Lakes Como and Maggiore.

LUGANSK, a market-town in the government of Ekaterinoslav, European Russia, situated on the Lugan, a branch of the Donetz, 100 miles north-north-west of Taganrog, is the seat of the only ironworks in the south of Russia. The ore was formerly brought from the Ural Mountains, but is now found in sufficient quantity in the neighbourhood. L. has also a cannon-foundry and coal-mines, and, during the Crimean war, supplied the Russian fleet with coal and ammunition.

LUGGAGE of travellers, though, in a certain sense, attached to the person, and under one's immediate care, and not paid for separately, is nevertheless protected by the contract; and carriers of all kinds are bound to carry luggage safely, and if it is lost, must pay damages for it. Owing to the established rule, that luggage is not paid for separately, it has often been attempted by travellers to abuse this privilege, and carry merchandise as part of and mixed up with their luggage, in order to escape any separate and extra payment. Most railway companies, accordingly, by their by-laws fix a limit as to weight for this luggage, and it is presumed that luggage consists only of wearing-apparel or things for personal use, and not articles of trade intended for sale. Though carriers or railway companies cannot get rid of liability for this luggage by giving any notice or making a by-law to that

effect, yet it is competent for all carriers to specify certain articles of merchandise, which, whether they are mixed up with luggage or not, must be separately paid for, otherwise they will not be responsible. Such are gold or silver in a manufactured state, jewellery, watches, clocks, trinkets, stamps, maps, writings, title-deeds, paintings, pictures, glass, china, silks, furs, and lace, provided these exceed in value £10. Unless notice of such articles being included in the luggage is given to the carriers or company, and an increased rate paid, they will not be responsible for the loss. Except, therefore, these excepted articles, the carrier is bound to receive, carry securely, and deliver the luggage of travellers, notwithstanding the traveller has it in his personal charge. Thus, a railway porter, on the arrival of the train, having carried a traveller's luggage to a cab and lost it in the way, the railway company was held responsible. A carrier has a lien on the luggage for the fare, if not paid, and can keep it till such fare is paid; but as prepayment is now the universal practice, this remedy is seldom resorted to.

LUGGER, a small vessel carrying two or three masts, with a lugsail (see below) on each, and occasionally a topsail. The rigging is light and simple, and the form of the sails enables a lugger to beat close up to the wind. Among English boats, the

Lugger.

lug-rig rarely extends beyond the larger class of fishing-vessels, though there are some very elegant lugger-yachts in the different clubs. In the French service, however, it is a favourite rig, and is used for vessels of sizes as large as British schooners.

LUGSAIL, a quadrilateral sail used in luggers and open boats. It is bent, by the upper side, upon a straight yard, which is slung on the mast in an oblique position, one-third to windward, two-thirds on the leeward side of the mast.

LUGO (the *Lucus Augusti* of the Romans), a town in the north-west of Spain, capital of the province of the same name, is situated on the left bank of the Miño, 50 miles east-north-east of Santiago. It is the seat of a bishop, has a cathedral of the 12th c., and several other churches, and manufactures of silk and leather. It was celebrated in the time of the Romans for its warm sulphur-baths. Pop. 8246.

LUG-WORM, or **LOB-WORM** (*Arenicola piscatorum*), one of the *Doridobranchiate Annelida*, extremely abundant on the British shores, and very valuable as bait to fishermen. It inhabits the sand, on the surface of which, after the tide has retired, innumerable coils are always to be seen, the casts of this worm. It is larger than the earthworm,

sometimes a foot long, is destitute of eyes, has no distinct head, but is much thicker at the extremity where the mouth is situated than at the other. The mouth has no jaws, nor teeth, nor tentacles. There are two rows of bristles along the sides, organs of locomotion, by means of which the *L.* works its way through the sand. About the middle, it has on each side six tufts of gills. (For fig., see *ANNELIDA*.) When touched, it exudes a yellowish fluid; and an exudation from its body slightly agglutinates the particles of sand, so as to form a tube through which it passes and repasses. It is one of the annelids most remarkable for the red colour of the blood, which imparts a fine crimson to the gill-tufts.

LUINI, or LOVINO DA LUINI, BERNARDINO, born about 1460 at Luini, near the Lago Maggiore, a celebrated painter of the Lombard school. He is generally stated to have been the principal pupil of Leonardo da Vinci, but it rather appears that he was educated under Stefano Scotto; and though, from having attended the Academy of the Fine Arts founded at Milan by Ludovico il Moro, of which Leonardo was director, he may be styled a pupil of that great artist, yet it is not proved that he received any direct instruction from him. Though *L.* occasionally imitated the style and execution so closely as to deceive experienced judges, his general manner had a delicacy and grace sufficiently original and distinct from that of Leonardo. Still the works of the former are often attributed to the latter, in order to increase their value. He executed numerous works at Milan in oil and fresco. His frescoes at Lugano, Saronno, and Pavia, are justly admired. The date of his death is not exactly known, but he was alive in 1530.—He had a brother, AMBROGIO, who imitated his style, and several sons who also were painters.

LUISE, AUGUSTE WILHELMINE AMALIE, queen of Prussia, was born, 10th March 1776, at Hanover, where her father, the Duke Karl of Mecklenburg-Strelitz, was then commandant. She was married to the Crown-prince of Prussia, afterwards Frederick William III., on 24th December 1793. After his accession to the throne, she became exceedingly popular, her great beauty being united with dignity and grace of manners, and with much gentleness of character and active benevolence. This popularity increased in consequence of her conduct during the period of national calamity which followed the battle of Jena, when she displayed not only a patriotic spirit, but no little energy and resolution. She was unexpectedly taken ill, and died when on a visit to her father in Strelitz, 19th July 1810. Her memory is cherished in Prussia, and the Order of Luise in that kingdom was founded in honour of her.

LUKE (*Lucas*), the author of one of the gospels, and of the Acts of the Apostles, was born, according to the accounts of the church Fathers, at Antioch in Syria, and is said to have been a physician. He was probably by descent a Hellenistic Jew. We learn from Scripture that he was the associate of Paul in his second evangelistic expedition (52 A.D.); but that is all we know; whatever else is asserted concerning him is doubtful. That he was a painter, is one of the things for which tradition vouches; and in the church of St John Lateran at Rome a picture of our Saviour is shewn, which is ascribed to *L.*, but is believed to be a work of the 13th century. The churches of Padua, Venice, and Rome also possess many pretended relics of this evangelist. His festival is commemorated by the Roman Catholic Church on the 18th of October.—The Gospel of St Luke, addressed to a certain Theophilus, is generally believed to have been written before the destruction of Jerusalem. Rénan, however, in his

Vie de Jesus (1863), considers its composition subsequent to that event. The time and place of its origin are unknown. See Schleiermacher's *Die Schriften des L.* (Berlin, 1817). The apocryphal writings ascribed to *L.* are, *Ada Pauli*, *Baptismus Leonis*, and *Liturgia XII. Apostolorum*.

LULLY, RAYMOND, 'the enlightened doctor,' one of the most distinguished men of the 13th c., was born at Palma, in Majorca, in 1234. In his youth, he led a dissolute life, and served for some time as a common soldier; but a complete revulsion of feeling taking place, he withdrew to solitude, and gave himself up to extatic meditations and the study of the difficult sciences. This sudden change of life produced in *L.* a fervid and enthusiastic state of mind, under the influence of which he formed the project of a spiritual crusade for the conversion of the Mussulmans, an idea he never afterwards abandoned. In pursuance of this project, he commenced an earnest study of theology, philosophy, and the Arabic language; and, after some years, published his great work, *Ars Generalis sive Magna*, which has so severely tested the sagacity of commentators. This work is the development of the method of teaching known subsequently as the 'Lullian method,' and afforded a kind of mechanical aid to the mind in the acquisition and retention of knowledge, by a systematic arrangement of subjects and ideas. Like all such methods, however, it gave little more than a superficial knowledge of any subject, though it was of use in leading men to perceive the necessity for an investigation of truth, the means for which were not to be found in the scholastic dialectics. *L.* subsequently published another remarkable work, *Libri XII. Principiorum Philosoph. contra Averroistas*, and, full of the principles which he had developed in this book, he went to Tunis, at the end of 1291, or the beginning of 1292, to argue with his opponents, face to face. He drew large crowds of attentive hearers, and held disputations with learned Mohammedans, who, however, were as anxious to convert him as he to convert them, and the result, as might have been expected, was that little impression was made by either of the parties. Finally, however, *L.* was thrown into prison, and condemned to banishment. After lecturing at Naples for several years, he proceeded to Rome; thence to his native island of Majorca, where he laboured for the conversion of the Saracens and Jews; thence to Cyprus and Armenia, zealously exerting himself to bring back the different schismatic parties of the oriental church to orthodoxy. In 1306—1307, he again sailed for Africa, entered the city of Bugia (then the capital of a Mohammedan empire), and undertook to prove the truth of Christianity. A tumult arose, in which *L.* nearly lost his life. He was again thrown into prison, and treated with great severity; yet so high an opinion was entertained of his abilities, that the chief men of the place were anxious that he should embrace Mohammedanism, and promised him if he did so the highest honours. But to *L.*, whose intellect and feelings were both enlisted in the cause of Christianity, this was impossible. After some time he was again banished from the country, and landed (after being shipwrecked) near Pisa. He subsequently went to Paris, and lectured against the principles of Averroes; he also induced the pope to establish chairs for the Arabic, Chaldean, and Hebrew languages in all cities where the papal court resided, and also at the universities of Paris, Oxford, and Salamanca. But his missionary zeal could only be satiated by martyrdom. In 1314, he sailed once more for Africa, and proceeded to Bugia, where he threatened the people with divine judgments if they

refused to abjure Mohammedanism. The inhabitants were furious, dragged him out of the city, and stoned him to death, 30th June 1315. The Mayence (10 vols. 1721–1742) edition of his works includes several books on alchemy, of which there is not the slightest reason to suppose L. was the author. Compare Neander's *Kirchengeschichte*, Bohn's translation, vol. vii. pp. 83–96.

LUMBA'GO is a rheumatic affection of the muscles in the lumbar region, or in the small of the back. It is often first recognised by the occurrence of a sharp stabbing pain in the loins upon attempting to rise from the recumbent or sitting position. It is sometimes so severe as to confine the patient to bed and in one position, from which he cannot move without intense suffering; but in milder cases he can walk, although stiffly and with pain, and usually with the body bent more or less forward. It may be distinguished from inflammation of the kidneys by the absence of the peculiar direction of the pain towards the groin, as also by the absence of the nausea and vomiting which usually accompany the disease of the kidney.

The causes of lumbago are the same as those of sub-acute rheumatism generally. The complaint may arise from partial exposure to cold, especially when the body is heated, and violent straining will sometimes induce it. In persons with a strong constitutional tendency to rheumatism, the slightest exciting cause will bring on an attack of lumbago.

The treatment must vary with the intensity of the affection. In most cases, a warm bath at bedtime, followed by ten grains of Dover's powder, will speedily remove it; and as local remedies, a mixture of chloroform and soap-liniment, or the application of the heated hammer (an instrument sold by Coxeter, surgical-instrument maker, London), will be found serviceable. The writer of this article has frequently seen the disorder completely disappear after one application of the hammer, which should be heated in a spirit-lamp to somewhat about 200°, and then be rapidly brought in contact with points of the skin over the painful parts at intervals of about half an inch. Each application leaves a red spot, but blisters seldom occur, if the operation is properly performed.

LUMINOSITY OF ORGANIC BEINGS.

Many organic beings, both vegetables and animals, possess the property of emitting light.

In cryptogamic plants, it has been observed on the filaments of *Schistostegia oemundacea*, one of the order of Hepaticæ; in *Rhizomorpha subterranea*, belonging to the order of Fungi (which is not uncommon on the walls of dark, damp mines, caverns, &c., and occasionally emits a light sufficiently clear to admit of reading ordinary print); in certain species of *Agaricus* (belonging to the same order); and in *Thelaphora carulea* (also a fungus), to which decayed wood owes its phosphoric light.

An emission of light, chiefly in flashes, has been observed in the case of a few phanerogamic plants, among which may be mentioned the garden nasturtium and marigold, the orange lily, and the poppy. In these instances, the light has been emitted by the flowers; but cases are also recorded in which the leaves, juice, &c., of certain plants have evolved light. The emission of light from the common potato, when in a state of decomposition, is sometimes very striking. Dr Phipson, in his work *On Phosphorescence*, mentions a case in which the light thus emitted from a cellarful of these vegetables was so strong as to lead an officer on guard at Straaburg to believe that the barracks were on fire. The phosphorescence in this case is probably due to the same cause as that of decayed wood.

Before proceeding to notice the principal cases in which living animals have been observed to emit light, we shall briefly refer to the emission of light by dead animal matter. The bodies of many marine animals shine after death, but in none is the phenomenon so vivid or continuous as in the well-known boring mollusc the *Pholas*. The luminosity of this animal after death was known to Pliny, who said that it shone in the mouths of persons who ate it; and has been made the subject of special investigation by Réaumur, Beccaria, and others. Among other results, they found that a single *Pholas* rendered seven ounces of milk so luminous that the faces of persons might be distinguished by it; and that, by placing the dead animal in honey, its property of emitting light, when plunged into warm water, lasted more than a year.

It is universally known that certain kinds of dead fish, especially mackerels and herrings, shine in the dark. From a careful study of the body of a dead stock-fish in a luminous condition, Dr Phipson finds that the phenomenon is due to a grease which shines upon the fish, and which (as it neither contains phosphorus nor minute fungi, by which the light might have been caused) contains some peculiar organic matter, which shines in the dark like phosphorus itself.

Several cases are on record in which ordinary butcher's meat has presented the phenomenon now under consideration, but their occurrence is so rare that we need not specially notice them. It may be observed that phosphorescent light is not unfrequently observed on the dead human body by persons who visit dissecting-rooms by night. The occasional evolution of light by living human beings will be presently referred to.

The living animals which possess the property of emitting light are extremely numerous, decided cases of phosphorescence having been frequently observed, according to Dr Phipson, 'in infusoria, rhizopoda, polypes, echinoderms, annelides, medusæ, tunicata, molluscs, crustaceans, myriapodes, and insects.' Following the arrangement here laid down, we shall mention a few of the organisms in which the phenomenon in question is most remarkable. Among the rhizopoda, the *Noctiluca miliaris*, a minute animal very common in the English Channel, stands pre-eminent. Dr Phipson relates that he has found it 'in such prodigious numbers in the damp sand at Ostend, that on raising a handful of it, it appeared like so much molten lava.' It is the chief cause of the phosphorescence of the sea, which is so often observed. Among the annelides, earthworms occasionally evolve a shining light like that of iron heated to a white heat. Among the tunicata, a minute animal common in some of the tropical seas, the *Pyrosoma Atlantica*, resembles a minute cylinder of glowing phosphorus, and sometimes occurs in such numbers, that the ocean appears like an enormous layer of molten lava or shining phosphorus. Among the myriapodes, certain centipedes—viz., *Scolopendra electrica* and *S. phosphorea*—present a brilliant phosphoric appearance. There is reason to believe that the former will not shine in the dark, unless it has been previously exposed to the solar rays. Luminosity in insects occurs in certain genera of the Coleoptera and Hemiptera, and possibly in certain Lepidoptera and Orthoptera. Among the Coleoptera, must be especially mentioned the genus *Lampyris*, to which the various species of Glowworms (q. v.) belong, and the genus *Elater*, to which the Fireflies (q. v.) belong. In the Hemiptera, there is the genus *Fulgora*, or Lantern-flies (q. v.), some species of which are highly luminous.

The evolution of light from animals belonging to the vertebrates is extremely rare. Bartholin, in

his treatise *De Luce Hominum et Brutorum* (1647), gives an account of an Italian lady, whom he designates as 'mulier splendens,' whose body shone with phosphoric radiations when gently rubbed with dry linen; and Dr Kane, in his last voyage to the polar regions, witnessed almost as remarkable a case of human phosphorescence. A few cases are recorded by Sir H. Marsh, Professor Donovan, and other undoubted authorities, in which the human body, shortly before death, has presented a pale luminous appearance.

It is very difficult to give a satisfactory explanation of the above facts. The light evolved from fungi is most probably connected with chemical action, while that emitted in sparks and flashes from flowers is probably electrical. In some luminous animals, a phosphorescent organ, specially adapted for the production of light, has been already detected, and as anatomical science progresses, the same will probably be found in all organisms endowed with luminous or phosphorescent properties. For full details on the subject of this article, the reader is referred to Dr Phipson's work, *On Phosphorescence* (London, 1862).

LUMPSUCKER, or LUMPFISH (*Cyclopterus*), a genus of fishes of the family *Diaboli* (q. v.), having the head and body deep, thick, and short, the back with an elevated ridge, the fins rather small, and the ventrals united by a membrane so as to form a sucking disc.—One species (*C. lumpus*) is common on the coasts of Britain, particularly in the northern parts, and is still more plentiful in the seas of more northern regions. It has a grotesque

Lumpsucker (*C. lumpus*).

and clumsy form, but its colours are very fine, combining various shades of blue, purple, and rich orange. It attains a pretty large size, sometimes weighing seven pounds. The L. preys on smaller fishes. Its sucker is so powerful that a pail containing some gallons of water has been lifted when a L. contained in it was taken by the tail. Its flesh is insipid at some seasons, but very fine at others, and is much used for food in northern regions. It is often brought to the Edinburgh market. It is known in Scotland as the *Cock Pailie*.

LUNACY. By the law of England, as well as of all other countries, the presumption is in favour of a man's sanity, even though he be born deaf, dumb, and blind; and if the fact is disputed, it always lies on the party alleging it to prove it. Sometimes a person in a state supposed to be that of a lunatic makes a contract, and is sued upon it; in such a case, he may set up as a defence that he was a lunatic, and the proof will consist of his conduct and actions at and previous to the time in question. If, however, the other party did not know of the

lunacy, and took no advantage, the lunatic will not be allowed to recover back moneys which have been paid by him in pursuance of his contract. Though the presumption is in favour of the sanity of a person, yet, when once insanity has existed, the presumption is reversed, and then the law presumes no lucid interval or restoration to sanity until it is proved, and it is extremely difficult to prove a lucid interval for the law requires very clear and conclusive proof of that fact, and all the circumstances must be carefully scanned. It is difficult or impossible to define in words what is insanity or lunacy, it being a negative state, and merely an inference from the acts, conduct, and bodily condition of the person. An idiot is said to be a person who was born with a radical infirmity of mind, and whose state is one of perpetual infirmity, incapable of cure or restoration; whereas a lunatic is one who is sometimes of good and sound mind, and sometimes not; he has lucid intervals, and is assumed to be more or less capable of restoration to sanity. A person is said to be, in legal phraseology, of unsound mind, who is not an idiot, nor a lunatic, nor yet of a merely weak mind, but, by reason of a morbid condition of intellect, is as incapable of managing his affairs as if he were a lunatic. Though it is difficult to define lunacy or insanity, there are various tests which are more or less accepted in everyday life as strong evidence. Idiocy is accompanied by a vacant look, &c., while insanity is accompanied by some frenzy or extravagant delusion. The physiology of idiocy and lunacy is a separate subject of investigation, and is part of medical jurisprudence, to which a few medical men confine their attention, and their assistance is often required by courts of law when inquiring into the state of mind, though their theories are jealously scrutinised. As a general rule, an idiot or a lunatic is subject to civil incapacity. He cannot enter into contracts or transact general business, and what he does is a nullity. Thus he cannot make or revoke a will, or enter into marriage, or act as an executor or administrator, or become a bankrupt, or be a witness in a court of justice, or vote at elections, and such like. But, as a general rule, a lunatic is liable in damages for committing a wrong, such as a trespass, and he is liable for necessities supplied to him, and he may be arrested for debt, and his property may be taken in such cases, as in the case of sane persons. With regard to criminal responsibility, the law was fully considered in the case of M'Naughton, who, in 1843, shot Mr Drummond at Charing Cross by mistake for Sir Robert Peel, and the English judges were called on by the House of Lords to state their opinion as to the right mode of putting the questions to a jury when the defence of insanity is raised. The judges said that a person labouring under an insane delusion as to one subject is liable to punishment, if at the time of committing the crime he knew he was acting contrary to law. In general cases, to establish want of responsibility, it must be proved that the party accused was labouring under such a defect of reason, from disease of mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know he was doing what was wrong. Where the party is labouring under an insane delusion as to existing facts, and commits a crime in consequence thereof, it depends on the nature of the delusion whether he is excused. Thus, if he insanely believes that A intended to kill him, and he kills A, as he supposes, in self-defence, he would be exempt from punishment. But if his delusion was that A had inflicted a serious injury to his character and fortune, and he killed A in revenge for such supposed injury, then he would be liable to punishment. When a person is acquitted of crime

on the ground of insanity, he is liable to be confined in prison during her Majesty's pleasure.

So long as a person is not actually declared insane or an idiot, he has a right to manage his own affairs; and the only way, in England, in which he can be deprived of such right used to be by a writ *de lunatico inquirendo*, issuing out of Chancery, which authorised the empanelling of a jury to decide whether he was a lunatic or not. The custody and care of lunatics were vested in the crown; and the Lord Chancellor, as the depository of this jurisdiction, issued the writ on petition. The practice has now been considerably altered by various statutes, but, as a general rule, it is still the law, that, unless a person has been officially declared a lunatic, either by the verdict of a jury, or by a certificate of a master in lunacy, he is still entitled to manage his own affairs. In England and Ireland, there is no intermediate state called imbecility or weakness of mind, with which the law interferes, as there is in Scotland (see INTERDICTION, IMBECILITY), and hence, if a weak person is imposed on, it is treated merely as a case of fraud, the weakness forming an element of such fraud; but there is no machinery for restraining the natural right, even of weak-minded persons, to do what they like with their property. As regards idiots and lunatics, the mode in which they are judicially declared to be so, is as follows: There are certain persons called masters in lunacy, whose business it is to conduct the inquiries which are necessary, and preside over the jury, and they also visit lunatics in certain cases. The commissioners of lunacy form a Board, which supervises generally the lunatic asylums and licensed houses for reception of lunatics. The incapacity of a lunatic or idiot is conclusively established by the verdict of a jury under an inquisition *de lunatico inquirendo*, held before a master in lunacy; or, if the case is too clear for a jury, and where the party has not mental capacity to declare his wish on the subject, by a certificate of a master in lunacy. The Lord Chancellor may direct the trial to take place before one of the common-law judges, and the evidence is to be confined to the lunatic's conduct during the previous two years only. The costs of the trial are in the Lord Chancellor's discretion. If the party has property, the Lord Chancellor then appoints, on petition, a committee of the estate or of the person of the lunatic, and the visitors in lunacy must visit each lunatic at least once a year, unless the lunatic is in a private house unlicensed, in which case he must be visited four times each year. The lunatic is thus kept under the immediate control of the Court of Chancery, which manages his property through the agency of the committee and of the visitors in lunacy. But as many lunatics have no property, or property of a trifling nature, it has long been found necessary to provide asylums and registered houses for the reception of lunatics, all which are more or less under control of the commissioners in lunacy. Houses kept for the reception of lunatics are either provided by the counties, and called county asylums, or they are hospitals founded by charitable donors, or they are mere private houses, kept for purposes of profit by individuals. County asylums were first established in 1808 (see LUNATIC ASYLUM). The justices of every county are bound to provide such an asylum, or to join with some other parties in keeping one, the expense being defrayed out of the county rates, and a committee of justices being appointed as visitors, to see that the statute is complied with. The object of the county asylum is to receive the lunatic paupers of the county. As a general rule, it is incumbent on the parish officers of each

parish to report to the neighbouring justices any case of a lunatic pauper being in their parish. In some cases of a harmless description, such paupers may be kept in the workhouse; but in other cases, on the matter being reported to the justices, the latter order the paupers to be brought before them for examination, and then send them to the county asylum; the parish to which the pauper belongs—i.e., in which he is legally settled—being liable to defray the maintenance; but if the parish which is legally bound to support the pauper cannot be discovered, then the expense is to be charged to the county. If the pauper cannot be examined by the justices, the medical officer and a clergyman may sign a certificate, which is taken to be evidence of the lunacy. As to private houses, no person is allowed to receive two or more lunatics, unless such house has been previously licensed by the commissioners in lunacy, which licence is only given after inspection, and a report as to its sanitary arrangements and other items of management. No person can be legally received into such licensed house without a written order from the person sending him, and the medical certificates of two physicians, surgeons, or apothecaries. The keepers of such houses are liable to visitation by the commissioners, and to render regular reports as to all particulars concerning the admission, death, removal, discharge, or escape of patients. The commissioners have power to visit at unexpected times, and to receive reports from other visitors. The commissioners may discharge persons who seem to be detained without sufficient cause.

In Scotland, the law differs in several respects from the above. Idiots and lunatics are often called fatuous and furious persons respectively; and there is an intermediate state called imbecility or weakness of mind, upon evidence of which the relations may apply to the Court of Session for Judicial Interdiction (q. v.), which has the effect of protecting the imbecile from squandering his heritable property. The care and custody of lunatics and idiots belong to the Court of Session, which may appoint a *curator bonis* or judicial factor to take charge of the estate, and a curator or tutor dative to take charge of the lunatic's person. A party is cognosed as a fatuous or furious person by a jury presided over by the sheriff. The recent statutory provisions concerning Scotch lunatics are contained in the statutes 20 and 21 Vict. c. 71, 21 and 22 Vict. c. 89, and 25 and 26 Vict. c. 54. There is also a Board called the Commissioners in Lunacy for Scotland, who may grant licences for private asylums. They may also give special licences to occupiers of houses for the reception of lunatics, not exceeding four in number, subject to rules and regulations. Counties and parishes may contract for accommodation of their lunatic paupers. Minute provisions are contained in these statutes as to the mode of treatment and visitation of lunatics, which, in leading points, resemble those regulating the practice in England.

LUNAR CAUSTIC is the term applied to the fused nitrate of silver, when cast into small cylinders. It is, when freshly prepared, of a whitish striated appearance; but on exposure to the air, the outer surface becomes decomposed, and blackens.

The uses of lunar caustic in surgery as a caustic are numerous. It is a useful application to punctured, and especially to poisoned wounds. When applied to large indolent ulcers, it acts as a stimulant, and restores a more healthy action. It is used to remove and keep down spongy granulations (popularly known as proud-flesh) in wounds and ulcers, and to destroy warts. It has been applied with good effect to the pustules in small-pox, in order to cut

short their progress and to prevent pitting. It is of great service as a local application in inflammatory affections and ulcerations of the mucous membrane of the mouth and throat. In fissured or excoriated nipples, its application gives great relief. It should be insinuated into all the cracks, and the nipple afterwards washed with tepid milk and water. It is also extensively employed in diseases of the eye, of the genito-urinary organs, and in some forms of skin-disease.

LUNAR THEORY, a term employed to denote the *a priori* deduction of the moon's motions from the principles of gravitation. See **MOON**.

LUNATIC ASYLUM. The first hospitals for the insane of which history or tradition makes mention, were the sacred temples in Egypt. In these, it is said, the disease was mitigated by agreeable impressions received through the senses, and by a system resembling and rivaling the highest development of moral treatment now practised. Monasteries appear to have been the representative of such retreats in the mediæval Christian times; but restraint and rigid asceticism characterised the management. Out of conventual establishments grew the Bethlems, or Bedlams, with which our immediate ancestors were familiar (see **BEDLAM**). But apart from such receptacles, the vast majority of the insane must have been neglected; in some countries, revered as specially God-stricken; in others, tolerated, or tormented, or laughed at, as simpletons or buffoons; in others, imprisoned as social pests, even executed as criminals. In a few spots, enjoying a reputation for sanctity, or where miraculous cures of nervous diseases were supposed to have been effected, such as Gheel and St Suaire, communities were formed, of which lunatics, sent with a view to restoration, formed a large part, and resided in the houses of the peasants, and partook of their labour and enjoyments. Asylums, properly so called, date from the commencement of the present century; and for many years after their institution, although based upon sound and benevolent views, they resembled jails both in construction and the mode in which they were conducted, rather than hospitals. Until very recently, a model erection of this kind was conceived necessarily to consist of a vast block of building, the centre of which was appropriated to the residence of the officers, the kitchen and its dependencies, the chapel, &c., from which there radiated long galleries, in which small rooms, or cells, were arranged upon one or both sides of a corridor or balcony, having at one extremity public rooms, in which the agitated or non-industrial inmates, as the case might be, spent the day, while the more tractable individuals were withdrawn to engage in some pursuit, either in workshops, clustered round the central house, or in the grounds attached, which were surrounded by high walls, or by a ha-ha. The population of such establishments, when they were appropriated to paupers, ranged from 100 to 1400 patients. These were committed to a staff composed of a medical officer, matron, and attendants, to whom were directly intrusted the management, discipline, and occupation of the insane, in accordance with regulations or prescriptions issued by the physician. A gradual but great revolution has taken place in the views of psychologists as to the provisions and requirements for the insane during seclusion. As a result of this change, asylums, especially for the wealthy classes, are assimilated in their arrangements to ordinary dwelling-houses; while it is proposed to place the indigent in cottages in the immediate vicinity of an infirmary, where acute cases, individuals dangerous to themselves

or others, or in any way untrustworthy, could be confined and actively treated, as their condition might require. In all such establishments, whether now entitled to be regarded as cottage asylums or not, the semblance and much of the reality of coercion has been abolished; the influence of religion, occupation, education, recreation; the judicious application of moral impressions; and the dominion of rational kindness and discriminating discipline, have been superadded to mere medical treatment, and substituted for brute force, terror, and cruelty.—Esquirol, *Des Maladies Mentales*, t. ii.; Guislain, *Sur l'Aliénation Mentale*; Browne on *Asylums*, &c.; Conolly on *Construction of Asylums*.

LUND (*Londinum Gothorum*), a city of Gothland, in the extreme south of Sweden, and in an extensive and fertile plain 30 miles south-east of Helsingborg. At present, it has only about 7300 inhabitants, but was once much larger, when it was the chief seat of the Danish power in the Scandinavian peninsula, and for a long period the capital of the Danish kingdom. The principal building is the cathedral, the lower part of which is as old as the 11th century. It has manufactures of cloth, tobacco, and leather. L. is one of the oldest towns in Scandinavia; in 920, it was taken and plundered by a band of Vikings; it was the see of a bishop from the time of the introduction of Christianity, and from 1104 its archbishop long exercised jurisdiction over all Denmark, Sweden, and Norway. L. has a university, founded in 1623, which has now 25 professors and about 500 students, a library of 50,000 volumes, and some thousands of manuscripts, an excellent zoological museum, and a botanic garden.

LÜNÉBURG, a town of Hanover, in the province of the same name, is situated on the river Ilmenau, 24 miles south-east of Harburg by railway. It is mentioned as early as the age of Charlemagne, and was formerly an important Hanseatic town. It is surrounded with high walls and towers, and possesses many ancient buildings. The trade is considerable. In the immediate vicinity of L. is the salt-work of Stülze, discovered in the 10th c., and still very productive. Close by is a hill 200 feet high, with rich seams of lime and gypsum. Pop. 12,600. It was at L. that the first engagement took place in the German war of liberation, 2d April 1813. About 16 miles to the south-west of the town, in the Lüneburg Heath, lies the Gölde, a beautiful forest, with a royal hunting-lodge.

LÜNEBURG, formerly a principality in Lower Saxony, now a province of the kingdom of Hanover. Area, 4293 square miles; pop. (1861) 367,663, mostly Protestants. The Elbe forms its northern boundary. Great part of the country is occupied by the *Lüneburg Heath*. See **HANOVER**.

LUNEL, a town in the south of France, department of Hérault, 14 miles east-north-east of Montpellier, has a population of about 6000, and a considerable trade in Muscatel wine and raisins. Near it is a cave, important for the fossil bones found in it.

LUNETTE, in Fortification, is a small work beyond the ditch of the ravelin, to supply its deficiency of saliency, and formed at the re-entering angle made by the ravelin and bastion. The lunette has one face perpendicular to the ravelin, and the other nearly perpendicular to the bastion. See **FORTIFICATION**.

LUNÉVILLE, a town in the department of Meurthe, in France, at the confluence of the Meurthe and the Vezouse, is a regularly built

and unwall town of 12,164 inhabitants. It was formerly a frequent residence of the Dukes of Lorraine, and their palace is now used as a cavalry barrack. *L.* has manufactures of cotton and worsted goods, embroidery, and earthenware. It is one of the largest cavalry stations in France. The town has a historic celebrity from the Peace of Lunéville, concluded here on February 9, 1801, between Germany and France, on the basis of the Peace of Campo-Formio (q. v.).

LUNGS. See RESPIRATION, ORGANS OF.

LUNGWORT, or OAK-LUNGS (*Sticta pulmonaria*), a lichen with a foliaceous leathery spreading thallus, of an olive-green colour, pale brown when dry, pitted with numerous little cavities and netted, much lacerated; the shields (apothecia) marginal, reddish brown with a thick border. It grows on trunks of trees in mountainous regions, in Britain and other European countries, sometimes almost entirely covering them with its shaggy thallus. It has been used as a remedy for pulmonary diseases. It is nutritious, and, when properly prepared, affords a light diet, capable of being used as a substitute for Iceland Moss; yet it is bitter enough to be used as a substitute for hops. It yields a good brown dye.—The name *Lungwort* is also given to a genus of phanerogamous plants (*Pulmonaria*), of the natural order *Boraginæ*. The common *L. (P. officinalis)* is a rare and rather doubtful native of Britain, although common in some parts of Europe. It has ovate leaves and purple flowers, and was formerly employed in diseases of the lungs, but seems to have been recommended chiefly by a fancied resemblance to the lungs in its spotted leaves. It is mucilaginous, and slightly emollient. It contains nitr in considerable abundance. It is used in the north of Europe as a pot-herb.

LUPERCA'LLIA, a festival among the ancient Romans, held on the 15th of February, in honour of *Lupercus*, the god of fertility. When Rome began to seek a Grecian origin for its religious ceremonies, *Lupercus* was identified with *Lycæan Pan*, and his worship was said to have been introduced by *Evander*, the Arcadian. Modern scholars place no value on such statements. *Lupercus* is believed by them to have been one of the oldest pastoral deities of Italy, and everything that is known regarding him and his rites favours this view. These rites were of the rudest and most primitive character, and indicate a high antiquity. Goats and dogs were sacrificed; afterwards, the priests (called *Luperci*) cut up the skins of the victims, and twisted them into thongs, with which they ran through the city striking every one who came in their way (which women used to do) in hopes that the god of fertility would be propitious towards them. As the festival is believed to have been at first a shepherd one, this running about with thongs is understood to have been intended as a symbolical purification of the land. The place where the festival was held was called the *Lupercal*, and was situated on the Palatine Hill. It contained an image of *Lupercus*, covered with a goat's skin. *L.* were also held in other cities of Italy.

LUPINE (*Lupinus*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionacæ*, mostly annuals, but some of them perennial herbaceous plants, some half-shrubby; and generally having digitate leaves, with rather long stalks. The flowers are in racemes or spikes, the calyx two-tipped, the keel beaked, the filaments all united at the base. The species of *L.* are numerous, and are chiefly natives of the countries near the Medi-

terranean Sea, and of the temperate parts of North and South America. The **WHITE L.** (*L. albus*), a species with white flowers, has been cultivated from time immemorial in the south of Europe and in some parts of Asia, for the sake of the seeds, which are farinaceous, and are used as food, although, when raw, they have a strong, disagreeable, bitter taste, which is removed by steeping in water and boiling. They were a favourite kind of pulse amongst the ancient Greeks and Romans, and still are so in some parts of the south of Europe, although generally disliked by those who have not been accustomed to them. They are used in many countries for feeding cattle, particularly draught-oxen.—The **YELLOW L.** (*L. luteus*), so called from its yellow flowers, and the **EGYPTIAN WHITE L.** (*L. termis*), which has white flowers tipped with blue, are also cultivated in the south of Europe, Egypt, &c., for their seeds, which are similar in their qualities to those of the white lupine.—In many countries, lupines, and particularly the white lupine, are cultivated to yield green food for cattle, and also to be ploughed down for manure. They grow well on poor and dry sandy soils, which by this process of *green-manuring*, are fitted for other crops. Many species of *L.* are cultivated in our flower-gardens, having beautiful white, yellow, pink, or blue flowers. The flowers of some species are fragrant. No *L.* is a native of Britain. *L. perennis* adorns sandy places from Canada to Florida with its fine blue flowers.

LUPULINE. See HOPS.

LUPUS is a chronic disease of the skin, in which dull or livid tubercles are developed, which have a tendency to destroy or seriously to affect the adjacent tissues, with or without ulceration, and commonly ending in indelible cicatrices. It was formerly known as *noli me tangere*. The disease usually attacks the face, especially the ala of the nose and the lips, but is sometimes met with elsewhere. It is a terrible disease, but is happily of rare occurrence. It derives its name from the Latin word for a wolf, in consequence of its destructive nature.

Lupus usually commences with the appearance of one or two circular or oval, dull-red, somewhat translucent tubercles, about two lines in diameter. After a time, these tubercles increase in number and size, and take on new characters. They may ulcerate, constituting the variety known as *Lupus exedens*, in which case the ulceration may pursue a superficial or a deep course. Scabs are formed over the ulcers; and as these scabs are thrown off, the ulcer beneath is found to have increased in extent, till great destruction of the soft parts and (in the case of the nose) of the cartilages is effected. The ulcer of lupus has thick red edges, and exudes a fetid, ichorous matter in considerable quantity. When they do not ulcerate, the tubercles are softer than in the previous variety, and form patches of considerable extent, the intervening skin and cellular tissue also swelling and exhibiting here and there dull-red points, which are the summits of the imbedded tubercles. The lips become much enlarged, the nostrils closed with the swelling, the eyelids everted, and the whole face hideous. This variety is known as *Lupus non exedens*.

The progress of lupus is usually slow, and the sufferings of the patient less than might be expected, in consequence of the sensibility of the parts being diminished from the first. The complaint may continue for years, or even for life, but is seldom fatal. Its causes are not well known, but it is thought that a scrofulous habit and intemperance predispose to the disease. Both sexes are liable to

it, but it seems most common in women. It is not contagious.

The internal treatment consists in the administration of cod-liver oil and the preparations of iodine, especially Donovan's solution, while locally strong escharotics should be applied. The disease is, however, so serious, that whenever there is a suspicion of its nature, professional aid should be sought.

LURCHER, a kind of dog, somewhat resembling a greyhound, and supposed to derive its origin from some of the old rough-haired races of greyhound crossed with the shepherd's dog. It is lower, stouter, and less elegant than the greyhound, almost rivals it in fleetness, and much excels it in scent. It is covered with rough wiry hair, is usually

Lurcher.

of a sandy red colour, although sometimes black or grey, and has half-erect ears and a pendent tail. It is the poacher's favourite dog, possessing all the qualities requisite for his purposes, in sagacity rivaling the most admired dogs, and learning to act on the least hint or sign from its master. Of course, it is detested by gamekeepers, and destroyed on every opportunity.

LURGAN, a thriving town of Ireland, in the county of Armagh, a station on the railway from Belfast to Armagh, 20 miles south-west from the former town. It is unusually neat and clean in appearance, and carries on manufactures of damasks and diapers. Pop. 7766.

LURLEI, or **LORELEI**, the name of a steep rock on the right bank of the Rhine, about 430 feet high, a little way above St Goar, celebrated for its echo, which is said to repeat sounds fifteen times. Near it is a whirlpool, and still nearer, a rapid, called *the Bank*, formed by the river rushing over a number of sunken rocks—visible, however, at low water. In consequence, the navigation of the Rhine by rafts and boats is rather dangerous at this point, which circumstance, in connection with the echo, has undoubtedly given rise to the legend of the beautiful but cruel siren who dwelt in a cave of the L., and allured the passing voyagers to approach by the magic melody of her song, until she wrecked and sank them in the whirlpool. The legend has been a great favourite with the German poets, but none has treated it so exquisitely as Heine.

LUSATIA (*Lausitz*), a region in Germany, now belonging in part to Saxony and in part to Prussia. It was formerly divided into Upper and Lower L., which constituted two independent margraviates, including an area of about 4400 square miles, and a population of about half a million, and bounded on the S. by Bohemia, on the W. by Misnia and the Electorate of Saxony, on the N. by Brandenburg, and on the E. by Silesia. In 1319, L. was given to Bohemia, but was obtained by

Matthias Corvinus in 1478, and was finally transferred to Saxony in 1635; but, by the Congress of Vienna, the whole of Lower L. and the half of Upper L. was ceded to Prussia. The portion left to Saxony now forms the circle of Bautzen.

LUSTRUM (from *luere*, to purify or expiate), the solemn offering made for expiation and purification by one of the censors in name of the Roman people at the conclusion of the Census (q. v.). The animals offered in sacrifice were a boar (*sus*), sheep (*ovis*), and bull (*taurus*), whence the offering was called *Stovelauria*. They were led round the assembled people on the Campus Martius before being sacrificed. As the census was quinquennial the word *lustrum* came to signify a period of five years.

LUTE (Lat. *lutum*, clay), in Chemistry, denotes a substance employed for effectually closing the joints of apparatus, so as to prevent the escape of vapour or gases, or for coating glass vessels so as to render them more capable of sustaining a high temperature, or for repairing fractures. For ordinary purposes, lutes made of common plastic clay or pipeclay with an admixture of linseed-meal or almond-powder, or, for common stills, linseed-meal and water made into a paste, are quite sufficient, for more delicate experiments, *Fat Lute* (q. v.), covered over with moistened bladder, is used. Lutes for coating glass vessels are generally composed of Stourbridge clay or Windsor loam, mixed with water; but the most simple method is to brush the glass retort over with a paste of pipeclay and water, dry it quickly, and repeat the operation till a sufficient thickness of coating is obtained. Other lutes in frequent use are *Willie's lute* (a paste composed of a solution of borax in boiling water, with alkali lime), various mixtures of borax and clay, of lime and white of egg, *iron cement* (see **CEMENT**), moistened bladder, paper prepared with wax and turpentine, and caoutchouc. The use of the last-named lute has, on account of its flexibility, and consequent non-liability to accident, been rapidly extending.

LUTHER, MARTIN, the greatest of the Protestant reformers of the 16th c., was born at Eisleben on the 10th November 1483. His father was a miner in humble circumstances; his mother, as Melancthon records, was a woman of exemplary virtue (*exemplar virtutum*), and peculiarly esteemed in her walk of life. Shortly after Martin's birth, his parents removed to Mansfeld, where their circumstances ere long improved by industry and perseverance. Their son was sent to school; and both at home and in school, his training was of a severe and hardening character. His father sometimes whipped him, he says, 'for a mere trifle till the blood came,' and he was subjected to the scholastic rod fifteen times in one day! Scholastic and parental severity was the rule in those days; but whatever may have been the character of L.'s schoolmaster at Mansfeld, there is no reason to believe that his father was a man of exceptionally stern character. While he whipped his son soundly, he also tenderly cared for him, and was in the habit of carrying him to and from school in his arms with gentle solicitude. L.'s schooling was completed at Magdeburg and Eisenach, and at the latter place he attracted the notice of a good lady of the name of Cotta, who provided him with a comfortable home during his stay there.

When he had reached his eighteenth year, he entered the university of Erfurt, with the view of qualifying himself for the legal profession. He went through the usual studies in the classics and the schoolmen, and took his degree of Doctor of

Philosophy, or Master of Arts, in 1505, when he was twenty-one years of age. Previous to this, however, a profound change of feeling had begun in him. Chancing one day to examine the Vulgate in the University Library, he saw with astonishment that there were more gospels and epistles than in the lectionaries. He was arrested by the contents of his newly-found treasure. His heart was deeply touched, and he resolved to devote himself to a spiritual life. He separated himself from his friends and fellow-students, and withdrew into the Augustine convent at Erfurt.

Here he spent the next three years of his life—years of peculiar interest and significance; for it was during this time that he laid, in the study of the Bible and of Augustine, the foundation of those doctrinal convictions which were afterwards to rouse and strengthen him in his struggle against the papacy. He describes very vividly the spiritual crisis through which he passed, the burden of sin which so long lay upon him, 'too heavy to be borne;' and the relief that he at length found in the clear apprehension of the doctrine of the 'forgiveness of sins' through the grace of Christ.

In the year 1507, L. was ordained a priest, and in the following year he removed to Wittenberg, destined to derive its chief celebrity from his name. He became a teacher in the new university, founded there by the Elector Frederick of Saxony. At first, he lectured on dialectics and physics, but his heart was already given to theology, and in 1509 he became a Bachelor of Theology, and commenced lecturing on the Holy Scriptures. His lectures made a great impression, and the novelty of his views already began to excite attention. 'This monk,' said the rector of the university, 'will puzzle our doctors, and bring in a new doctrine.' Besides lecturing, he began to preach, and his sermons reached a wider audience, and produced a still more powerful influence. His words, as Melancthon said, were 'born not on his lips, but in his soul,' and they moved profoundly the souls of all who heard them.

In 1510 or 1511, he was sent on a mission to Rome, and he has described very vividly what he saw and heard there. His devout and unquestioning reverence, for he was yet in his own subsequent view 'a most insane papist,' appears in strange conflict with his awakened thoughtfulness and the moral indignation at the abuses of the papacy beginning to stir in him.

On L.'s return from Rome, he was made a Doctor of the Holy Scriptures, and his career as a Reformer may be said to have commenced. The system of indulgences had reached a scandalous height. The idea that it was in the power of the church to forgive sin, had gradually grown into the notion, which was widely spread, that the pope could issue pardons of his own free will, which, being dispensed to the faithful, exonerated them from the consequences of their transgressions. The sale of these pardons had become an organised part of the papal system. Money was largely needed at Rome, to feed the extravagances of the papal court; and its numerous emissaries sought everywhere to raise funds by the sale of 'indulgences,' as they were called, for the sins of frail humanity: the principal of these was John Tetzel, a Dominican friar, who had established himself at Jüterboch, on the borders of Saxony. L.'s indignation at the shameless traffic which this man carried on, finally became irrepressible: 'God willing,' he exclaimed, 'I will beat a hole in his drum.' He drew out 95 theses on the doctrine of indulgences, which he nailed up on the gate of the church at Wittenberg, and which he offered to maintain in the university against all

impugners. The general purport of these theses was to deny to the pope all right to forgive sins. 'If the sinner was truly contrite, he received complete forgiveness. The pope's absolution had no value in and for itself.'

This sudden and bold step of L. was all that was necessary to awaken a widespread excitement. The news of it spread rapidly far and wide. It seemed 'as if angels had carried it to the ears of all men.' Tetzel was forced to retreat from the borders of Saxony to Frankfurt-on-the-Oder, where he drew out and published a set of counter-theses, and publicly committed those of L. to the flames. The students at Wittenberg retaliated by burning Tetzel's theses. The elector refused to interfere, and the excitement increased as new combatants—Hochstratten, Prierias, and Eck—entered the field. Eck was an able man, and an old friend of L.'s, and the argument between him and the Reformer was especially vehement.

At first, the pope, Leo X., took little heed of the disturbance; he is reported even to have said when he heard of it, that 'Friar Martin was a man of genius, and that he did not wish to have him molested.' Some of the cardinals, however, saw the real character of the movement, which gradually assumed a seriousness evident even to the pope; and L. received a summons to appear at Rome, and answer for his theses. Once again in Rome, it is unlikely he would ever have been allowed to return. His university and the elector interfered, and a legate was sent to Germany to hear and determine the case. Cardinal Cajetan was the legate, and he was but little fitted to deal with Luther. He would enter into no argument with him, but merely called upon him to retract. L. refused, and fled from Augsburg, whither he had gone to meet the papal representative. The task of negotiation was then undertaken by Miltitz, a German, and envoy of the pope to the Saxon court, and by his greater address, a temporary peace was obtained. This did not last long. The Reformer was too deeply moved to keep silent. 'God hurries and drives me,' he said; 'I am not master of myself: I wish to be quiet, and am hurried into the midst of tumults.' Dr Eck and he held a memorable disputation at Leipzig, in which the subject of argument was no longer merely the question of indulgences, but the general power of the pope. The disputation, of course, came to no practical result; each controversialist claimed the victory, and L. in the meantime made progress in freedom of opinion, and attacked the papal system as a whole more boldly. Erasmus and Hutten joined in the conflict, which waxed more loud and threatening.

In 1520, the reformer published his famous address to the 'Christian Nobles of Germany.' This was followed in the same year by a treatise *On the Babylonish Captivity of the Church*. In these works, both of which circulated widely, and powerfully influenced many minds, L. took firmer and broader ground; he attacked not only the abuses of the papacy, and its pretensions to supremacy, but also the doctrinal system of the Church of Rome. 'These works,' Ranke says, 'contain the kernel of the whole Reformation.' The papal bull was issued against him; the dread document was burned before an assembled multitude of doctors, students, and citizens at the Elster Gate of Wittenberg. Germany was convulsed with excitement. Eck (who had been the chief agent in obtaining the bull) fled from place to place, glad to escape with his life, and L. was everywhere the hero of the hour.

Charles V. had at this time succeeded to the

empire, and he convened his first diet of the sovereigns and states at Worms. The diet met in the beginning of 1521; an order was issued for the destruction of L.'s books, and he himself was summoned to appear before the diet. This was above all what he desired—to confess the truth before the assembled powers of Germany. He resolved to obey the summons, come what would. All Germany was moved by his heroism; his journey resembled a triumph; the threats of enemies and the anxieties of friends alike failed to move him. 'I am resolved to enter Worms,' he said, 'although as many devils should set at me as there are tiles on the house-tops.' His appearance and demeanour before the diet, and the firmness with which he held his ground, and refused to retract, all make a striking picture. 'Unless I be convinced,' he said, 'by Scripture and reason, I neither can nor dare retract anything, for my conscience is a captive to God's word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me, God. Amen.'

On his return from Worms, he was seized, at the instigation of his friend, the Elector of Saxony, and safely lodged in the old castle of the Wartburg. The affair was made to assume an aspect of violence, but in reality it was designed to secure him from the destruction which his conduct at Worms would certainly have provoked. He remained in this shelter for about a year, concealed in the guise of a knight. His chief employment was his translation of the Scriptures into his native language. He composed various treatises besides, and injured his health by sedentary habits and hard study. His imagination became morbidly excited, and he thought he saw and heard the Evil One mocking him while engaged in his literary tasks. On one occasion, he hurled his inkstand at the intruder, and made him retreat. The subject of the personality and presence of Satan was a familiar one with L., and he has many things about it in his *Table-talk*.

The disorders which sprang up in the progress of the Reformation recalled L. to Wittenberg. He felt that his presence was necessary to restrain Carlstadt and others, and defying any dangers to which he might still be exposed, he returned to the old scene of his labours, rebuked the unruly spirits who had acquired power in his absence, and resumed with renewed energy his interrupted work. He strove to arrest the excesses of the Zwickau fanatics, and counselled peace and order to the inflamed peasants, while he warned the princes and nobles of the unchristian cruelty of many of their doings, which had driven the people to exasperation and frenzy. At no period of his life is he greater than now in the stand which he made against lawlessness on the one hand and tyranny on the other. He vindicated his claim to be a Reformer in the highest sense by the wise and manly part which he acted in this great social crisis in the history of Germany.

His next act of importance was by no means so commendable. Although he had been at first united in a common cause with Erasmus, estrangement had gradually sprung up between the scholar of Rotterdam and the enthusiastic reformer of Wittenberg. This estrangement came to an open breach in the year 1525, when Erasmus published his treatise *De Libero Arbitrio*. L. immediately followed with his counter-treatise, *De Servo Arbitrio*. The controversy raged loudly between them; and in the vehemence of his hostility to the doctrine of Erasmus, L. was led into various assertions of a very questionable kind, besides indulging in wild abuse of his opponent's character. The quarrel was an unhappy one on both sides; and it must be

confessed there is especially a want of generosity in the manner in which L. continued to cherish the dislike which sprang out of it.

In the course of the same year, L. married Catharine von Bora, one of nine nuns, who, under the influence of his teaching, had emancipated themselves from their religious vows. The step rejoiced his enemies, and even alarmed some of his friends like Melancthon. But it greatly contributed to his happiness, while it served to enrich and strengthen his character. All the most interesting and touching glimpses we get of him henceforth are in connection with his wife and children.

Two years after his marriage, he fell into a dangerous sickness and depression of spirits, from which he was only aroused by the dangers besetting Christendom from the advance of the Turks. Two years later, in 1529, he engaged in his famous conference at Marburg with Zwingli and other Swiss divines. In this conference, he obstinately maintained his peculiar views as to the sacrament of the Lord's Supper (q. v.; see also *IMPANATION*); and as in the controversy with Erasmus, distinguished himself more by the inflexible dogmatism of his opinions, than by the candour and comprehensiveness of his arguments, or the fairness and generosity of his temper. Aggressive and reforming in the first stage of his life, and while he was dealing with practical abuses, he was yet in many respects essentially conservative in his intellectual character, and he shut his mind pertinaciously after middle life to any advance in doctrinal opinion. The following year finds him at Coburg, while the diet sat at Augsburg. It was deemed prudent to intrust the interests of the Protestant cause to Melancthon, who attended the diet, but L. removed to Coburg, to be conveniently at hand for consultation. The establishment of the Protestant creed at Augsburg marks the culmination of the German Reformation; and the life of L. from henceforth possesses comparatively little interest. He survived sixteen years longer, but they are years marked by few incidents of importance. He died in the end of February 1546.

L.'s character presents an imposing combination of great qualities. Endowed with broad human sympathies, massive energy, manly and affectionate simplicity, and rich, if sometimes coarse humour, he is at the same time a spiritual genius. His intuitions of divine truth were bold, vivid, and penetrating, if not comprehensive; and he possessed the art which God alone gives to the finer and abler spirits that He calls to do special work in this world, of kindling other souls with the fire of his own convictions, and awakening them to a higher consciousness of religion and duty. He was a leader of men, therefore, and a Reformer in the highest sense. His powers were fitted to his appointed task: it was a task of Titanic magnitude, and he was a Titan in intellectual robustness and moral strength and courage. It was only the divine energy which swayed him, and of which he recognised himself the organ, that could have accomplished what he did.

Reckoned as a mere theologian, there are others who take higher rank. There is a lack of patient thoughtfulness and philosophical temper in his doctrinal discussions; but the absence of these very qualities gave wings to his bold, if sometimes crude conceptions, and enabled him to triumph in the struggle for life or death in which he was engaged. To initiate the religious movement which was destined to renew the face of Europe, and give a nobler and more enduring life to the Saxon nations, required a gigantic will, which, instead of being crushed by opposition, or frightened by

hatred, should only gather strength from the fierceness of the conflict before it. To clear the air thoroughly, as he himself said, thunder and lightning are necessary; and he was well content to represent these agencies in the great work of Reformation in the 16th century. Upon the whole, it may be said that history presents few greater characters—few that excite at once more love and admiration, and in which we see tenderness, humour, and a certain picturesque grace and poetic sensibility more happily combine with a lofty and magnanimous, if sometimes rugged sublimity.

L's works are very voluminous, partly in Latin, and partly in German. Among those of more general interest are his *Table-talk*, his *Letters* and *Sermons*. De Wette has given to the public a copious and valuable edition of his *Letters*, which, along with his *Table-talk*, are the chief authority for his life. Many special lives of him, however, have been written, by Melancthon, Michelet, Audin, and others.

LUTHERANS, a designation originally applied by their adversaries to the Reformers of the 16th c., and which afterwards was distinctively appropriated among Protestants themselves to those who took part with Martin Luther against the Swiss Reformers, particularly in the controversies regarding the Lord's Supper. It is so employed to this day, as the designation of one of the two great sections into which the Protestant Church was soon unhappily divided, the other being known as the *Reformed* (q. v.). To the end of Luther's life, perfect harmony subsisted between him and his friend Melancthon; but already there were some who stood forth as more Lutheran than Luther, and by whom Melancthon was denounced as a *Crypto-Calvinist* and a traitor to evangelical truth. After Luther's death, this party became more confident; and holding by Luther's words, without having imbibed his spirit, changed his evangelical doctrine into a dry scholasticism and lifeless orthodoxy, whilst extreme heat and violence against their opponents were substituted in the pulpit itself for the zealous preaching of the gospel. The principal seat of their strength was in the university of Jena, which was founded in 1557 for this very object, and maintained their cause against Wittenberg. The utmost illiberality characterised this party; and in so far as governments came under their influence, extreme intolerance was manifested, the measures adopted against those who differed from them being not unfrequently of a persecuting nature. No controversy was ever conducted with more bitterness than the *Sacramentarian Controversy* (q. v.).

Towards the end of the 17th c., the Lutherans of Germany found a new object of hostility in the *Pietists* (q. v.), against whom they stirred up the passions of the multitude, and instigated the governments to severity.—In the 18th c., they came into conflict with *Rationalism* (q. v.), which may be regarded as a consequence of the state of things existing in Germany during the previous period of unprofitable theological strife.—When, after the wars of the French Revolution were over, the Prussian government formed and carried into execution a scheme for the union of the Lutheran and Reformed churches into one national church (see PRUSSIA), an active opposition arose on the part of those who now began to be known as *Old Lutherans*. Separate congregations were formed, and an attitude of open hostility to the government was assumed by some; whilst others, more moderate, but holding the same theological opinions, continued to maintain these opinions within the *United Evangelical Church*. Amongst the latter are some of the most eminent divines in

Germany, as Hengstenberg, Olshausen, Guericke, and Tholuck. The separatists were for some time severely dealt with by the government, and consequently many left their native country to found Old Lutheran communities in America and Australia. This took place chiefly about the year 1837. After that time, greater toleration was practised, and now the Old Lutherans form a legally recognised ecclesiastical body in Prussia. For some time after the political excitement of 1848, those who held the Lutheran doctrines within the national or United Evangelical Church of Prussia, exhibited considerable uneasiness, and a strong desire for a position more consistent with their ecclesiastical traditions; but more recently this feeling seems to have been considerably allayed.

Lutheranism is the prevailing form of Protestantism in Saxony, Hanover, and the greater part of Northern Germany, as well as in Würtemberg; it also prevails to a considerable extent in other parts of Germany. It is the national religion of Denmark, Sweden, and Norway; and there are Lutheran churches in Holland, France, Poland, &c. Amongst the Lutheran symbolical books, the *Augsburg Confession* (q. v.) holds the principal place; but the supreme authority of the Holy Scriptures is fully recognised. The chief difference between the Lutherans and the Reformed is as to the *real presence* of Christ in the sacrament of the Supper; the Lutherans holding the doctrine of *consubstantiation*, although rejecting *transubstantiation* (see LORD'S SUPPER; IMPANATION; and TRANSUBSTANTIATION); whilst some of their more extreme theologians have asserted not only the presence of the human nature of Christ in the Lord's Supper, as Luther did, but the absolute omnipresence of his human nature. Other points of difference relate to the allowance in Christian worship of things *indifferent* (*adiaphora*); and many of those things at first retained as merely tolerable by Luther and his fellow-reformers, have become favourite and distinguishing characteristics of some of the Lutheran churches—as images and pictures in places of worship, clerical vestments, the form of exorcism in baptism, &c. Among the Old Lutherans of Prussia, particularly the separatists, a strong tendency to exaggeration in these distinctive peculiarities has manifested itself.

In many of the Lutheran churches, the doctrines of Luther, and of their symbolical books, have long given place, in a great measure, to Arminianism, and to a system of religion very inconsistent with Luther's doctrine of justification by faith. In some quarters, particularly in Norway and Sweden, a reaction has of late years appeared; and many of the Lutheran divines of Germany are strenuous supporters of the 'evangelical' doctrines of the Reformers.

In its constitution, the Lutheran Church is generally *unepiscopal*, without being properly *presbyterian*. In Denmark and Sweden there are bishops, and in Sweden an archbishop (of Upsal), but their powers are very limited. Where Lutheranism is the national religion, the sovereign is recognised as the supreme bishop, and the church is governed by consistories appointed by him, and composed both of clergymen and laymen. The members of congregations possess almost no rights.

LUTON, a market-town and parish of England, county Bedford, situated 30 miles north-north-west of London, on the river Lea, which rises in the parish. It is connected with the London and North-western and the Great Northern Railways by branch-lines from Leighton Buzzard to Hatfield. Staple trade, straw-hat manufacture. Pop. of town, 15,329. The parish church, an ancient and noble

structure, contains an elegant, and perhaps unique, baptismal font.

LÜTZEN, a small town of 2509 inhabitants, in the Prussian province of Saxony, famous for two great battles fought in its vicinity. The first took place on 4th November 1632. Gustavus Adolphus, who had moved in the direction of Bavaria, being recalled from his designs of conquest there by the advance of Wallenstein on Saxony, united his forces with those of Duke Bernard of Saxe-Weimar, and attacked the Imperialists at Lützen. The fortune of the day was very various; but notwithstanding the death of Gustavus Adolphus, victory remained with the Swedes, and Wallenstein was compelled to resign to them the field of battle. About 9000 men were killed and severely wounded.

The *Battle of L.*, on 2d May 1813, was fought somewhat further to the south, at the village of Grossgörschen. It was the first great conflict of the united Russian and Prussian army with the army of Napoleon in that decisive campaign. The allies gained at first great successes, but the French were left in possession of the field at the close of the day; their superiority in numbers securing them the victory, although they lost about 12,000 men, and the allies only 10,000. By this battle, the French regained possession of Saxony and the Elbe.

LUXEMBOURG, FRANÇOIS HENRI DE MONTMORENCY, DUKE OF, Marshal of France, a famous general of Louis XIV., born at Paris 8th January 1628, was the posthumous son of François de Montmorency, Count of Bouteville, who was beheaded on account of a duel. His aunt, the mother of the Great Condé, brought him up as a companion of her son, with whom he took part in the disturbances of the Fronde, signalling himself in the battles then fought. Being afterwards received into favour by Louis XIV., he served as a volunteer under Turenne in Flanders (1667), in Franche Comté as the lieutenant-general of Condé, and in the Netherlands, where the battles of Grool, Deventer, Zwoil, &c., greatly increased his reputation. He had, however, the misfortune to embroil himself in a quarrel with the all-powerful Louvois, the results of which were disastrous to his prospects for a time. He assumed the title of L. on marrying the heiress of that house. Some of his military exploits were very daring, and were executed with great skill; his retreat from Holland, in particular, being executed in such a masterly manner, that it placed him among the foremost generals of his age: but he largely participated in the savage burning of towns, and desolating of conquered districts, which disgraced the French arms at that period, though it is believed that in this he only carried out the positive instructions which he received from Louvois (q. v.). In the campaign of 1677, he defeated the Prince of Orange at Mont-Cassel, took St Omer, and compelled the prince to raise the siege of Charleroi. After the Peace of Nimeguen, Louvois attempted to accomplish his destruction by means almost incredible. Having got possession of a contract between L. and a wood-merchant, he caused it to be changed so that it became a contract with the devil. Upon this, L. was summoned before the *Chambre Ardente*, and obeyed the citation, although his friends advised him to leave the country. He was thrown into the Bastille, and there confined in a dark dungeon. After fourteen months, he was acquitted and released, but banished to one of his domains, where he lived forgotten for ten years, at the end of which time, the king appointed him to the command of the army in Flanders. On the 1st

July 1690, he gained a victory over the Prince of Waldeck at Fleurus; on 4th August 1692, and 29th June 1693, over William III. of England, at Steenkirk and at Neerwinden. He took Charleroi 12th October 1693. He died 4th January 1695. L. was crooked in shape and feeble in body, but possessed an inexhaustible activity of spirit.

LUXEMBURG, an old German county, and afterwards a duchy, which, about the 12th c., came into possession of the Counts of Limburg, who assumed the title of Counts of Luxembourg. It was next acquired by Burgundy, and in this way came into the hands of Austria. By the Peace of Campo Formio (q. v.), it was ceded to France in 1797. In 1814, it was elevated to the rank of a grand duchy of the German Confederation, and given to Holland in compensation for the loss of Nassau. In 1830, when Belgium formed itself into an independent kingdom, L. was divided between it and Holland—the latter, however, retaining little more than the fortress of Luxembourg, till 1839, when, by a treaty signed in London, a new division was made more favourable to Holland.—BELGIAN L., or LUXEMBOURG, the largest province of Belgium, forming the south-east corner of the country, contains an area of 1690 English square miles, with a population (1861) of 202,080. It is traversed from south-west to north-east by a branch of the Ardennes, which nowhere exceed 2000 feet in height. The surface is in general extremely rugged, much covered with woods and morasses. The soil is poor. About a third of the arable land is devoted to pasture, great numbers of cattle, sheep, and horses being reared for export. The horses are a strong, hardy breed, much prized both for agricultural and military purposes. The mineral wealth of the country consists of iron, lead, copper, marble, freestone, slate, gypsum, &c. The chief manufactures are cloth, tulle, earthenware, leather, nails, and potash; and the principal articles of export are hemp, flax, oak-bark, timber, iron, leather, cheese, &c. The capital of the province, Arlon, has a pop. of 4200.—DUTCH L., which is not incorporated with the kingdom of Holland—the king of that country being only grand-duke of L.—ranks as a duchy in the Germanic Confederation. It lies east of the Belgian province of the same name, and quite apart from the other provinces of Holland. It has an area of 979 English square miles, with a pop. of (1861) 196,804, the most of whom are engaged in agriculture, which, notwithstanding, is in a very backward condition, owing to the unkindly nature of the soil. The chief products are wine, corn, hops, hemp, and flax; mines of iron in the eastern districts yield annually about 9000 tons after smelting, and the quarries of lime and slate are extensive. The inhabitants are mostly Walloons, and the remainder chiefly German. The capital of the province is Luxembourg (q. v.).

L., united with Limburg, occupies the 11th place in the Germanic Confederation, furnishes a contingent of 2706 men to the federal army, and possesses 5 votes in the *plenium*. See GERMANY.

LUXEMBURG, the capital of Dutch Luxembourg, is situated on the Elbe or Ailette, 76 miles south-by-east from Liege, and possesses a pop. of about 11,000. Its situation has often been compared to that of Jerusalem, being, like the latter, surrounded by escarped rocks, which, excepting the west side, average 200 feet in height. The Spaniards, Austrians, French, and Dutch, who successively held possession of the town, so increased and strengthened its fortifications that in the beginning of the 19th c. it was considered to be, with the exception of Gibraltar, the strongest fortress in Europe. Another portion of L., called the 'low town,

is situated at the foot of the precipice, along the banks of the river. It possesses a fine cathedral, various handsome buildings and public institutions. It has also manufactures of wax, distilleries, breweries, tanneries, and an extensive general trade. It is one of the federal fortresses, and is garrisoned by Prussian troops.

LUZON, the largest and most northerly of the Philippine Islands (q. v.).

LYCANTHROPIA (Gr. *lycos*, a wolf; *anthropos*, a man), wolf-madness. There has been in various countries and times a popular superstition and dread that men had been transmuted into wolves by Satanic agency, and roamed through forests and desert places actuated by the same appetites as the wild beast whose aspect or name they bore. The panic thus inspired may have suggested the delusion now under consideration, where the process of transformation was purely subjective, and the transforming power disease. Many instances occur, and may be encountered in every asylum, in which the insane conceive themselves dogs (*Cynanthropia*) and other animals, and even inanimate objects; but these are solitary cases, whereas this hallucination has appeared epidemically, and lycanthropes have literally herded and hunted together in packs. In 1800, multitudes were attacked with the disease in the Jura, emulated the destructive habits of the wolf, murdered and devoured children; howled, walked, or attempted progression upon all-fours, so that the palms of the hands became hard and horny; and admitted that they congregated in the mountains for a sort of cannibal or devil's Sabbath. Imprisonment, burning, scarcely sufficed to check what grew into a source of public danger. Six hundred persons were executed on their own confession. Cases in which the sufferer boasts of being a wolf, creeps like a quadruped, barks, leaps, lates, and which in other respects are closely allied to these, still happen in sufficient frequency to suggest the lesson, that we are chiefly protected from the prevalence of such a moral pestilence by education, the greater diffusion of knowledge and sound principle, and by attention to the laws of health.—Cahmel, *De la Folie*; Arnold, *On Insanity*.

LYCAON, a genus of *Canidae*, in dentition and general osteological structure nearly agreeing with dogs, but resembling hyenas in the form of the head and in having only four toes on each foot. The best ascertained species, *L. venaticus*, the WILD DOG, HYENA DOG, or HUNTING DOG of the Cape of Good Hope, is rather smaller than a mastiff, and has a tall, gaunt form. It is gregarious, and still infests even the neighbourhood of Cape Town, committing great depredations on flocks of sheep. It is found over great part of Africa, from the Cape of Good Hope to the valley of the Nile.

LYCAONIA, in ancient geography, a country in Asia Minor, bounded on the E. by Cappadocia, on the N. by Galatia, on the W. by Pisidia, and on the S. by Isauria and Cilicia. Its capital was Iconium (q. v.).

LYCEUM (Gr. *Lukion*), originally the name of a place in the immediate neighbourhood of Athens, consecrated to *Apollo Lyceus*, and noted for its shady wood and beautiful gardens, but particularly for its gymnasium, in which Aristotle and the Peripatetics taught, and from which the Romans borrowed the same name for similar institutions. In more modern times, the name L. was given in honour of Aristotle to the higher Latin schools in which the Aristotelian philosophy formed a principal branch of education; and at the present day, the name is variously applied to educational and literary institutions.

LYCH-GATE (Ang.-Sax. *lic* or *lice*, a body, corpse), or CORPSE-GATE, a churchyard gate covered with a roof. It is very common in many parts of England. The bodies of persons brought

Lych or Corpse Gate.

for burial are set down under the shelter of the roof while the service is read. Lych-gates are very rare in Scotland. There is one at Peebles; the illustration represents one at Blackford Church, in Perthshire.

LYCHNIS, a genus of plants of the natural order *Caryophyllaceae*; having a tubular 5-toothed calyx, corolla twice as long as the calyx, with a spreading wheel-shaped limb, crowned at the mouth of the tube, and generally divided at the border; ten stamens, and five styles. The species are herbaceous plants, generally perennial, natives of temperate countries. Several are found in Britain. The RAGGED ROBIN (*L. flos-cuculi*) is one of the most frequent ornaments of meadows and moist pastures; the GERMAN CATCHFLY (*L. viscaria*), very rare, and generally found growing on almost inaccessible precipices; the RED CAMPION (*L. diurna*), and the WHITE CAMPION (*L. vespertina*), abound in fields, hedges, and the borders of woods. The last two are diocious, and, strangely enough, the female of the first and the male of the second are very common, while the male of the first and female of the second are rather rare. The flowers of *L. vespertina* are usually fragrant in the evening. The SCARLET L. (*L. Chalcidonica*), a native of Asia Minor, is a frequent and brilliant ornament of flower-borders. Some of the species have saponaceous properties.

LYCIA, a country on the south coast of Asia Minor, extending towards Mount Taurus, and bounded on the W. by Caria, on the N. by Phrygia and Pisidia, and on the E. by Pamphylia. The most ancient inhabitants are said to have been two Semitic races called the *Solymi* and *Termulae*, the former of whom were driven from the coast to the mountains in the north by adventurers from Crete, under the command of Sarpedon, a brother of Minos, who first gave the country the name of Lycia. To what race the invaders belonged, is not certain; they were, however, not of Hellenic origin. The Lycians are prominent in the Homeric legend of the Trojan war. It shared the vicissitudes of the other states of Asia Minor, becoming subject to the Persian and Syrian monarchies, and then to Rome. During the time of its independence, it consisted of 23 confederate cities, of which the principal were Xanthus, Patara, Pinara, Olympus, Myra, and Tlos; and at the head of the whole confederation was a president or governor called the Lyciarch. Many

monuments and ruined buildings (temples, tombs, theatres, &c.), exquisite sculptures, coins, and other antiquities, testify to the attainments of the Lycians in civilisation and the arts, in which they rival the Greeks themselves. These antiquities, however, had received little attention, till Sir Charles Fellows, about twenty years ago, pointed out their interesting character. Since that time, they have been very assiduously explored and studied. A beautiful collection of Lycian sculptures, made by Sir Charles, is now to be seen in the British Museum. The most interesting of all the antiquities of L. are, however, the inscriptions in which a peculiar alphabet is used, nearly allied to the Phrygian, and the language of which appears to be an Indo-Germanic language mingled with Semitic words. Grotefend, Sharpe, Daniell, and others, have spent much labour in deciphering these inscriptions.

LYCOPERDON. See PUFF-BALL.

LYCOPODIA'CEÆ, a natural order of acrogenous or cryptogamous plants, somewhat resembling mosses, but of higher organisation, and by many botanists included amongst ferns as a sub-order. They have creeping stems and imbricated leaves. The axis consists entirely, or in great part, of annular vessels; the leaves are narrow and 1-nerved. The *theoz*, or spore-cases, are axillary, sessile, 1-3-celled, opening by valves, or not at all, and often of two kinds, the one containing minute powdery matter, the other sporules of much larger size, which are capable of germinating. The powdery particles have by some been regarded as *antheridia* (see *ANTHERIDIUM*), but the question of their nature is still involved in uncertainty.—The L. are most abundant in hot humid situations, especially in tropical islands, although some are found in very cold climates. About two hundred species are known.—The only British genus

is *Lycopodium*, of which six species are natives of Britain. The most abundant, both in Britain and on the continent of Europe, is the common CLUB-MOSS (*L. clavatum*), which creeps upon the ground in heathy pastures, with branching stems, often many feet long. A decoction of this plant is employed by the Poles to cure that frightful disease the *plica polonica*. The yellow dust or meal which issues from its spore-cases, and from those of *L. Selago*, is collected and used for producing the lightning of theatres, being very inflammable, and kindling with a sudden blaze when thrown upon a candle, the combustion taking place so

Club Moss (*Lycopodium clavatum*).

rapidly that nothing else is liable to be kindled by it. It is called *Lycopode* and *Vegetable Brimstone*, and by the Germans, *Lightning-meal* and *Witch-meal* (*Blitz-mehl* and *Hexen-mehl*). It is used for rolling up pills, which, when coated with it, may be put into water without being moistened. It is sprinkled upon the excoriations of infants, and upon parts affected with erysipelas, herpetic ulceration, &c. It is even used, although rarely, as a medicine in diseases of the urinary organs. The powder of other species is also regarded in Brazil and other countries as possessing power over the urinary and generative organs. The stems and leaves of

L. clavatum are emetic, those of *L. Selago* cathartic; a South American species, *L. catharticum*, is violently purgative, and is administered in cases of elephantiasis. *L. Selago* is employed by the Swedes to destroy lice on swine and other animals. *L. alpinum* is used in Iceland for dyeing woollen cloth yellow, the cloth being simply boiled with a quantity of the plant and a few leaves of the bog whortleberry. *L. complanatum* is used for the same purpose in Lapland, along with birch-leaves.—Many of the L. are very beautiful plants, and are much cultivated in hot-houses, green-houses, and fern-cases, in which they grow very luxuriantly.

LYCOURGUS, a celebrated Spartan lawgiver, whose history and legislation are involved in so much obscurity, that many modern critics have suspected them to be mythical. The account usually given is as follows: L., who flourished about 880 B.C. (or, according to others, about 1100 B.C.), was descended from the old Doric family of the Proclidae. His brother, Polydectes, king of Sparta, died, leaving his widow with child. This ambitious woman proposed to L. that he should marry her, in event of which she promised to destroy the fruit of her womb. L. was shocked, but feigned consent in order to save his brother's offspring. As soon as the child, who was named Charilaus, was born, he proclaimed him king, and became his guardian. At this time, Sparta is represented as being in a state of great disorder and demoralisation—the different sections of the community quarrelling among themselves for political supremacy. L. after some years left his native country, and travelled through many foreign lands—Crete, Asia Minor, India, Egypt, Libya, and Iberia—examining and comparing the political constitutions of the different countries, and finally returned to Sparta, full of knowledge fitting him to become one of the greatest legislators in the world. During his absence, things had got much worse in Sparta, and he had no sooner arrived than the entire community requested him to draw up a constitution for them. To this he consented, and having induced them to solemnly swear that they would make no change in his laws till he came back, he again left Sparta, and was never more heard of. By this mysterious self-expatriation, he hoped to make the Spartan constitution eternal. The people now saw that he was a god; a temple was erected in his honour, and annual sacrifices were ever afterwards offered to him. No critical scholar considers such a biography historical; the most that can be assumed as probable is, that a certain L. may have once existed, who at some critical juncture in Spartan affairs may have been selected, probably on account of his wisdom and reputation, to draw up a code of laws for the better government of the state. To represent the entire legislation of Sparta as invented (so to speak) by L., and imposed upon the people as a novelty, is simply incredible; the only theory worth a moment's consideration is that which supposes him to have collected, modified, improved, and enlarged the previously existing institutions of Sparta (q. v.).

LYDIA, anciently, a country of Asia Minor, bounded on the W. by Ionia, on the S. by Caria, on the E. by Phrygia, and on the N. by Mysia. It is said to have been originally inhabited by a people called Mæonians (whether of Semitic or Indo-Pelaëgic origin is much disputed by modern ethnographers), who were subdued or expelled by the Lydians (about 720 B.C.), a Carian race. The country was mountainous in the south and west—the principal range being that of Tmolus. It was celebrated for its fruitful soil, and for its mineral

wealth, particularly for the gold of the river Pactolus and of the neighbouring mines, but was infamous for the corruption of morals which prevailed amongst its inhabitants, and especially in Sardis (q. v.), its capital. L. attained its highest prosperity under the dynasty of the Mermnades (c. 700—546 B. C.). The first of this dynasty was the half-mythical Gyges (q. v.)—the last was the famous Croesus (q. v.), celebrated for his prodigious wealth. The subsequent history of L. is unimportant. Its antiquities have not yet been sufficiently explored. Compare Niebuhr's *Lectures on Ancient History*; Hamilton's *Researches*, and Menke's *Lydiaca, Dissertatio Ethnographica*.

LYDIAN MODE, one of the ancient Greek authentic modes in music, which was retained as one of the old church modes, the notes being F, G, A, B, C, D, E, F, the same as in our modern diatonic scale. Since the Reformation, the melodies in the Lydian mode have entirely disappeared, and the Lydian mode is used only occasionally in modulation from other modes.

LYDIAN STONE, a variety of flinty slate, but less hard than common flinty slate, and not of a slaty structure. It occurs in Britain and in many other countries, but was first brought from Lydia. It is generally grayish black, or quite black and velvet-like. It is polished, and employed as a touchstone for trying the purity of gold and silver by comparison of colours.

LYE, a term sometimes used to denote all solutions of salts, but more generally appropriated to solutions of the fixed alkalies, potash and soda, in water. The solutions of caustic potash and soda are called caustic lyes; those of their carbonates, mild lyes. The fluid which remains after a substance has been separated from its solution by crystallisation, is called the *Mother Lye*.

LYELL, SIR CHARLES, an eminent living geologist, is the eldest son of the late Charles Lyell, Esq. of Kinnordy, Forfarshire. He was born in 1797, and after receiving his early education at Midhurst, in Sussex, was entered at Exeter College, Oxford, where he graduated as B.A. in 1819. Here he attended the lectures of Buckland, and thus acquired a taste for the science he has since done so much to promote. After leaving the university, he studied law, and in due time was called to the bar; but his circumstances not rendering a profession necessary for a livelihood, he soon abandoned the law, and devoted himself to the prosecution of geology. To extend his knowledge in this department of science, he made geological tours in 1824, and again in 1828—1830, over various parts of Europe, and published the results of his investigations in the *Transactions of the Geological Society* and elsewhere. The first volume of his great work, *The Principles of Geology*, appeared in 1830, the second in 1832, and the third in 1833. A third edition of the whole work, in four volumes, appeared in 1834, a fourth in 1835, and a fifth in 1837. This work was divided into two parts, which have been subsequently published as two distinct works—viz., *The Principles of Geology; or the Modern Changes of the Earth and its Inhabitants, as illustrative of Geology*, which has now reached its ninth edition; and *The Elements of Geology; or the Ancient Changes of the Earth and its Inhabitants, as illustrated by its Geological Monuments*, of which the sixth edition is now in the press. L. has also pub-

lished *A First and Second Visit to North America, Canada, Nova Scotia, &c., with Geological Observations*, in four volumes, which has reached a second edition; and *The Geological Evidences of the Antiquity of Man, with Remarks on Theories of the Origin of Species by Variation*, 1833; besides a very large number of important geological papers in the *Proceedings and Transactions of the Geological Society*, the *Reports of the British Association*, &c.

L. was one of the early members of the Geological Society; and on the opening of King's College in 1832, he was appointed Professor of Geology, an office which he soon resigned. In 1836, he was elected President of the Geological Society, and was re-elected in 1850. He received the honour of knighthood, on account of his scientific labours, in 1848; and in 1855, the university of Oxford conferred on him the title of D.C.L.

LYLY, JOHN, an English dramatist, born in Kent about 1554, studied at Magdalen College, Oxford, and took his degree of M.A. in 1575. Of his career, nothing is known, except that he lived in London, and supported himself by his pen. He died early in the 17th century. L. wrote nine plays, most of which are on classical subjects—as *Sappho and Phaon*, *Endymion*, *Midas*, *Galathea*, and the *Maid's Metamorphosis*—the lyrics of which frequently display a sweet and graceful fancy; but the two works which have chiefly perpetuated his name are *Euphues, or the Anatomy of Wit*, and *Euphues and his England*. They are written in prose, and are marked by great affectation, bombast, and pedantry in the language and imagery; yet L. is said to have intended them for models of elegant English, and such the court of Elizabeth at least undoubtedly thought them. According to L.'s editor, Blount, 'that beauty at court which could not parley euphuism, that is to say, who was unable to converse in that pure and reformed English which he had formed his work to be the standard of, was as little regarded as she which now there speaks not French.'

LYME GRASS (*Elymus*), a genus of grasses, the species of which are natives of the temperate and colder regions of the northern hemisphere. The spikelets grow in pairs from the joints of the rachis, and each has 2—4 fertile florets, and two awnless glumes, both on the same side.—The SEA L. G. (*E. arenarius*) is frequent on the sandy shores of Britain and other parts of Europe. It is a coarse, grayish grass, often three or four feet high, with spiny-pointed leaves and upright close spikes; a perennial with creeping roots, very useful in binding the sand. On this account, it is much sown on the shores of Holland, and also to some extent on those of Britain. In Iceland and other countries, it is used for thatch. The seed, which is large, is collected in Iceland, and ground into meal, which is made either into porridge or into soft thin cakes, and is esteemed a great delicacy.—A closely allied species* or a variety, called GIANT L. G. (*E. giganteus*), is often sown in Holland, being preferred for its more vigorous growth.—Various expedients are adopted to secure the growth of L. G. seeds in very loose sands, as the laying down of pieces of turf, a gradual advancement from the margin of the sand, &c.

LYME REGIS, a seaport, municipal and parliamentary borough and watering-place of England, in Dorsetshire, is situated at the mouth of a rivulet called the Lym, 26 miles west of Dorchester. It received its first charter in the middle of the 13th c., and was a port of considerable importance during the reign of Edward III., for whom it provided three ships to assist in the siege of Calais in 1346. Its pier,

* This work has hitherto been published under the title of *Manual of Elementary Geology*. The title given in the text is that which is given by Lyell himself in the fly-leaf to his *Antiquity of Man*, 1863.

called the *Cobb*, is semicircular in form. It returns one member to the House of Commons. In 1862, 516 vessels of 21,395 tons entered and cleared the port. Pop. (1861) of parliamentary borough, 3215.

LYMINGTON, a seaport, market-town, and municipal and parliamentary borough of England, in the county of Hants, at the mouth of a river of the same name, and on a creek communicating with the Solent, 18 miles south-south-west of Southampton. Salt has long been manufactured; some of the salt-works being of great antiquity, and possibly of British origin. L. is also of some importance as a watering-place. It commands fine prospects of the Isle of Wight and the English Channel, and its vicinity abounds in charming scenery. L. returns two members to parliament. Pop. (1861) of parliamentary borough, 5179.

LYMPH (Gr. *lymphe*, water) is the term applied by physiologists to the fluid contained in the LYMPHATICS (q. v.). It is a colourless or faintly yellowish red fluid, of a rather saltish taste, and with an alkaline reaction. It coagulates shortly after its removal from the living body, and forms a jelly-like, semi-solid mass, which continues for some time to contract, so that at last the clot is very small, in proportion to the expressed serum. On microscopic examination, the lymph is seen to contain corpuscles which do not in any respect differ from the colourless blood-cells, molecular granules, fat globules, and occasionally blood corpuscles. The chemical constituents of lymph seem to be precisely the same as those of blood, excepting the substance peculiar to the red corpuscles.

From experiments on animals, it has been inferred that upwards of 28 lbs. of fluid (lymph and chyle) pass daily into the blood of an adult man.

The lymph seems to owe its origin to two distinct sources—viz., to the ultimate radicles of the lymphatic system, which contribute the homogeneous fluid portion, and the lymphatic glands, which contribute the corpuscles, granules, &c., seen under the microscope.

The uses of the fluid are twofold: in the first place, to convey from the tissues to the blood effete matters, to be afterwards excreted by the skin, lungs, and kidneys; and secondly, to supply new materials for the formation of blood.

LYMPHATICS, the vessels containing the Lymph (q. v.), are also called *Absorbents*, from the property which these vessels possess of absorbing foreign matters into the system, and carrying them into the circulation. The lymphatic system includes not only the lymphatic vessels and the glands through which they pass, but also the Lacteals (q. v.), which are nothing more than the lymphatics of the small intestine, and only differ from other lymphatics in conveying Chyle (q. v.) instead of lymph during the latter part of the digestive process.

The lymphatics are minute, delicate, and transparent vessels, of tolerable uniformity in size, and remarkable for their knotted appearance, which is due to the presence of numerous valves, for their frequent dichotomous divisions, and for their division into several branches before entering a gland. They collect the products of digestion and the products of worn-out tissues, and convey them into the venous circulation near the heart. (See the diagram in the article LACTEALS.) They are found in nearly every texture and organ of the body, excepting the substance of the brain and spinal cord, the eyeball, cartilage, tendon, and certain fetal strictures, and possibly also the substance of bone.

The lymphatics are arranged in a superficial and a deep set. The superficial vessels on the surface of the body lie immediately beneath the skin, and join

the deep lymphatics in certain points through perforations of the deep fascia; while in the interior of the body they lie in the sub-mucous and sub-serous areolar tissue. They arise in the form of a network, from which they pass to lymphatic glands or to a larger trunk. The deep lymphatics are larger than the superficial, and accompany the deep blood-vessels; their mode of origin is not known with certainty. The structure of the lymphatics is similar to that of veins and arteries.

The lymphatic or absorbent glands are small, solid, glandular bodies, varying from the size of a hemp-seed to that of an almond, and situated in the course of the lymphatic vessels. They are found in the neck (where they often become enlarged and inflamed, especially in scrofulous subjects), in the axilla, or arm-pit, in the groin (where, when inflamed, they give rise to the condition known as *Bubo*), and in the ham; while deep ones are found abundantly in the abdomen and the chest.

The lymph of the left side of trunk, of both legs of the left arm, and the whole of the chyle, is conveyed into the blood by the Thoracic Duct (q. v.); while the lymph of the right side of the head, neck, and trunk, and of the right arm, enters the circulation at the junction of the axillary and internal jugular veins on the right side, by a short trunk guarded at its opening by valves.

LYNCH LAW, the name given in the United States of America to the trial and punishment of offenders in popular assemblies without reference to the ordinary laws and institutions of the country. This barbarous mode of administering justice has always more or less prevailed in every country in times of great popular excitement, and has been necessarily resorted to in countries newly settled, where the power of the civil government is not yet sufficiently established. The name is derived by Webster from a Virginian farmer.

LYNCHBURG, a city of Virginia, United States of America, on the James River, 120 miles west-south-west of Richmond, remarkable for picturesque situation and scenery. It has 9 churches, a college, female academy, 70 tobacco-factories, 4 iron-foundries, 3 flouring-mills, 3 printing-offices. It is connected by a canal with navigable waters, and by lines of railway with the east, north, and south-west. Pop. in 1860, 9853.

LYNDHURST, LORD (JOHN SINGLETON Copley), English lawyer and statesman, was the son of J. S. Copley, R.A., painter of the 'Death of Chatham,' and other esteemed works. The Copleys were an Irish family, the painter's grandfather having emigrated from the county of Limerick, and settled at Boston, United States, where L. was born, May 21, 1772. While he was yet an infant, his father removed to England for the practice of his art. L. was educated at Trinity College, Cambridge, where he was Second Wrangler and Smith's Prizeman in 1794, and a Fellow in 1797. Called to the bar at Lincoln's Inn in 1804, he chose the Midland Circuit, and soon obtained briefs. In politics, he was at first Liberal, and long expressed sentiments hostile to the ministry of the day. He ably defended Watson and Thistlewood on their trial for high treason in 1817, and obtained their acquittal. Some surprise was therefore expressed when, in 1818, he entered parliament for a government borough. In 1819, he became Solicitor-general in the Liverpool administration, and in 1823 was promoted to the rank of Attorney-general. It was much to his credit that, unlike his predecessor, he instituted no *ex officio* informations against the press. In 1826, he became Master of the Rolls. When Mr Canning was charged to form a ministry in

1837, he offered the Great Seal to L. (then Sir John Copley), who was raised to the Upper House, and remained Lord Chancellor from 1837 to 1839. In 1831, he became Lord Chief Baron of the Exchequer, which office he exchanged for the woolack during the brief administration of Sir R. Peel in 1834. In 1835, he led the opposition to the Melbourne ministry in the Upper House, in speeches of great power and brilliancy. L.'s orations and annual reviews of the session did much to reanimate the Conservative party, and pave the way for their return to power in 1841. He then became Lord Chancellor for the third time, and held the Great Seal until the defeat of the Peel government in 1846. After that time, he took little part in house politics; but his voice has often been heard on matters of foreign policy, and in denunciation of tyranny in Italy and elsewhere. He died in London, October 12, 1863. L.'s high attainments as a lawyer have never been questioned, and his judgments—of which that in the great case of *Small v. Atwood* may be particularly cited—have never been excelled for clearness, method, and legal acumen. In the House of Peers, he had few equals among his contemporaries. So lately as 1860, when he was 88 years of age, he maintained, with great force and ability, the right of their lordships to reject the Paper Duties Bill—an act which the Lower House resented as a breach of its privileges.

LYNN, a city of Massachusetts, United States of America, nine miles north-east of Boston, in which nearly the whole population is engaged in the manufacture of boots and shoes, leather, lasts, and works connected with this manufacture, which amounts to 5,000,000 dollars per annum, employing 11,000 women and 4500 men. A large portion of this manufacture has been for the Southern States. L. has 18 churches, 40 schools, 3 banks, 3 weekly newspapers. Pop. in 1860, 19,083.

LYNN, LYNN REGIS, or KING'S LYNN, a seaport, municipal, and parliamentary borough of England, in the county of Norfolk, is situated about three miles from the mouth of the Great Ouse, and 41 miles west-north-west from Norwich. It was formerly fortified, and the old moat still forms the eastern boundary of the town, and portions of the walls remain. The Grammar-school, with an annual income from endowment of £75, has six exhibitions for Cambridge. Ropes are manufactured here, and ship-building is carried on. Great numbers of shrimps are caught in the vicinity, and sent to London. The imports are corn, oilseed cake, cork, sulphur, wine, coal, and timber. In 1862, 1870 vessels, of 167,497 tons, entered and cleared the port. It returns two members to parliament. The pop. was 16,170 in 1861.

LYNX, a genus of *Felidae*, having a less elongated form than many others of that family, the body elevated at the haunches, long fur, a short tail, and the ears tipped with tufts or pencils of hairs. They are less courageous than other *Felidae* of similar size, and prey on small quadrupeds and birds. In pursuit of birds, they climb trees. They are generally of a sullen and suspicious temper, and not easily tamed. To this genus belongs the Caracal (q. v.), which is probably the L. of the ancients. The species are pretty numerous, and widely distributed, but the distinctions of species and varieties are somewhat uncertain. The EUROPEAN L. (*L. virgatus*) is common in many parts of Europe and Asia, chiefly in mountainous and wooded districts. Its colour is variable, but generally of a dark reddish gray, spotted with reddish brown, the belly whitish. It is about three feet long. It is proverbial for its keenness of sight. It is hunted in winter for its

fur, which is always in demand in the market; but many of the L. skins imported from the north of Asia probably belong to other species: those of North America, and probably also many of those of the north of Europe and of Asia, are the skins of the CANADA L. (*L. Canadensis* or *L. borealis*), which

European Lynx (*L. virgatus*).

is generally of a hoary-gray colour, a broad space along the back blackish brown. It is rather larger than the European L., and more clumsy in form.—The BAY L. (*L. rufus*) is found in more southern parts of North America, both in mountainous and in swampy districts, and often makes great havoc among poultry. It is commonly called in America the wild cat.

LYON, the second town of France in respect of population, and the first with regard to manufactures, is the capital of the department of the Rhone, and stands at the confluence of the river of that name with the Saône, 316 miles by railway south-south-east of Paris, 218 north-north-west of Marseille, and 100 west-south-west of Geneva. It is situated partly on a low-lying peninsula between the two rivers, and partly on hills surrounding them, in a beautiful district covered with gardens, vineyards, and villas. It is the seat of an archbishop, and is the *chef-lieu* of the seventh military division. Many of the public buildings are interesting at once for their architecture, extent, and antiquity. Of these, the cathedral and church of St Nimer, the Hôtel-de-Ville (town-hall), the finest edifice of the kind in the empire, the hospital, the public library with 130,000 volumes, and the Palais des Beaux Arts, are perhaps the most notable among numerous and important institutions. There are also a university-academy, an imperial veterinary school—the first founded in the country, and still the best—schools for agriculture, medicine, and the fine arts, &c. There are more than 20 printing-offices, the principal journals being the *Courrier de Lyon*, *Gazette de Lyon*, and *Salut Public*. The two rivers are crossed by 19 bridges; 12 over the Saône, and 7 over the Rhone. The quays, 28 in number, are said to be the most remarkable in Europe. The principal are St Clair, St Antoine, and Orleans. There are several large and important suburbs—La Guillotière, Les Brotteaux, La Croix-Rousse, &c.; several fine squares, of which the *Place Bellecour* is one of the largest in Europe. The fortifications extend in a circle of 13 miles round the city. From its situation on two great rivers, and on the Paris and Marseille and other railways, L. has become the great warehouse of the south of France and of Switzerland. The principal manufactures of L. are silk stuffs of all kinds, which have long been held in the highest esteem. An immense number of establishments, giving employment directly or indirectly to 100,000 hands, are engaged in the manufacture of silk fabrics. Nets, cotton goods, blankets, hats, gold

and silver lace, chemical products, drugs, liquors, earthenware, are also important articles of manufacture. The trade of L. is chiefly in its own manufactures and in the products of the vicinity; the arms and silk ribbons of St Etienne, and the wines of Côte-Rôtie, Hermitage, and St Peray. Pop. (1862) 313,803.

L., the ancient *Lugdunum*, was founded in the year 43 B.C. by Munatius Plancus. Under Augustus it became the capital of the province *Gallia Lugdunensis*, possessed a senate, a college of magistrates, and an athenaeum, and became the centre of the four great roads that traversed Gaul. In 58 A.D., it was destroyed in one night by fire; but was built up again by Nero, and embellished by Trajan. In the 6th c., it was one of the principal towns of the kingdom of Burgundy; and in the 11th and 12th centuries, it had risen to great prosperity. To escape the domination of the lords and archbishops, the inhabitants placed themselves under the protection of Philippe-le-Bel, who united the town to France in 1307. After the Revolution (1789), L., which had at first supported the movement with great enthusiasm, eventually became terrified at the acts of the central power, and withdrew from the revolutionary party. The result of this was, that the Convention sent against L. an army of 60,000 men, and after a disastrous siege, the city was taken, and almost totally destroyed. It rose again, however, under the first Napoleon; and though, since then, it has frequently suffered much from inundations (1840 and 1856) and from the riots of operatives (1831 and 1834), it is now (1863) in a high state of prosperity.

LYON COURT, the Heralds' Court for Scotland, presided over by the Lord Lyon King-at-arms (q. v.). Attached to the Lyon Court are six Heralds (see HERALD), and six Pursuivants (q. v.), all appointed by the Lyon. Though the heralds were at one time conjoined with the Lord Lyon in the exercise of jurisdiction over armorial bearings, the powers of the Lyon Court have long been exercised by the king-at-arms alone, the duties of heralds and pursuivants being almost exclusively confined to attendance at royal proclamations and public solemnities. The Lyon has, for more than a century, discharged the greater part of the duties of his office by a deputy known as the Lyon Depute, who is generally a member of the bar or writer to the signet. Among the officials of his court are a clerk, called the Lyon-clerk, who is also keeper of records; the Lyon-clerk depute; the Procurator Fiscal, or public prosecutor; a herald painter; and a messenger-at-arms, who acts as mace. The jurisdiction of the Lyon Court is regulated by two acts of the Scottish parliament, 1592 c. 127, and 1672 c. 21. These statutes authorise the Lord Lyon to inspect the ensigns armorial of all noblemen and gentlemen in Scotland, and oblige all persons who, by royal concession or otherwise, had previously a right to arms, to matriculate or register them in the Lyon's books. The Lyon is empowered to inquire into the relationship of younger branches of families having right to arms, and to 'assign suitable differences to them, without which the arms cannot lawfully be borne.' The later act establishes the now existing register of the Lyon Court as the 'true and unrepeatable rule of all arms and bearings in Scotland,' and authorises the Lord Lyon to 'give arms to virtuous and well-deserving persons,' not hitherto entitled to bear them. The unlawful bearing of arms subjects the delinquent to a fine, and confiscation of all the movable goods and gear on which the said arms are engraven or otherwise represented. Both acts are in full force: the differencing of cadets and granting of new coats are matters of

daily practice in the Lyon Office. Questions have been raised as to how far the decisions of the Lyon Court can be reviewed by the Court of Session, and it seems now to be held that they are subject to review only where the Lyon is alleged, in granting arms, to have invaded the rights of others.

Right to bear arms is acquired either by descent or by grant. 1. In the former case, only the representative or head of the family can use the undifferenced coat; but a cadet, on presenting a petition to the Lord Lyon, and establishing his relationship, has, by a matriculation, the family coat assigned to him, with such a difference as, according to the rules of heraldry, appropriately sets forth his relationship to the head of the family and to other cadets already matriculated. The mere fact of ever bearing the same surname with a family entitled to arms, confers no sort of right to wear these arms differenced or undifferenced. 2. Where no hereditary right exists or can be proved, an original grant of arms may be bestowed by the Lord Lyon. As in the case of a matriculation, a petition is presented to the Lyon Court, which, in this case, need be accompanied with no evidence of pedigree; and in granting new coats, it is the duty of the Lyon to conform to the rules of good heraldry, and be observant of the rights of other parties. With these reservations, the wishes of the applicant are consulted as to the arms which he is to bear. The fees payable for a matriculation, where relationship is proved, are about £14; for an original grant, £42—in both cases much below the fees of the English College of Arms. An additional charge is made for Supporters (q. v.), which are only given to those persons who are entitled to them by the heraldic practice of Scotland.

In strictness, the using of a crest on one's plate or seal without authority, is a transgression of the above-mentioned acts; but practically, prosecutions have generally been confined to cases of open and public assumption of a shield of arms. The offender is cited before the Lyon Court by precept at the instance of the Procurator Fiscal; the statutory fine and confiscation have occasionally been enforced, but they have oftener, particularly of late, been avoided by a timely submission. Though these statutes have doubtless to some extent checked the illegal assumption of arms, it is believed that a considerable number of transgressors are yet to be found. In this commercial country, there are not a few persons whose social status would entitle them to the use of arms, but who, not having inherited a coat, instead of acquiring the privilege in a legal way, have a sham coat invented for them by some coach-painter or 'finder' of arms. According to Mr Seton (*Law and Practice of Heraldry in Scotland*, 1863), the Lyon Office has latterly been rather remiss in dealing with such persons; and now, when heraldry is recovering from the neglect under which it lay, and its usefulness is becoming daily more apparent to the critical student of history, 'there seems no reason whatever why the statutory penalties should not be more strictly enforced.' These penalties are a check not on an act of unmeaning folly, but on a direct falsification of history. A heraldic shield is a record whose nice distinctions state, to all who understand its language, a variety of particulars regarding the descent of the owner of it; and the measure of the utility of such a record is of course its truthfulness.

The Register of Genealogies is a department of the Lyon Office unconnected with heraldry, where evidence is taken of the pedigree of applicants, irrespectively of noble or humble lineage, and recorded for preservation.

Besides his functions, heraldic and genealogical,

LYON KING-AT-ARMS—LYSANDER.

the Lord Lyon has a jurisdiction connected with the executive part of the law: he appoints all messengers-at-arms, superintends them in the execution of their duty, takes cognisance of complaints against them, and fines, suspends, or deprives them for malversation.

LYON (or **LORD LYON**) **KING-AT-ARMS**, the chief heraldic officer for Scotland, whose title is derived from the lion rampant in the royal escutcheon. The Scottish King-at-arms has, unlike his brother-kings of England, from an early period exercised jurisdiction independently of the constable and marshal, holding office directly from the sovereign by commission under the Great Seal. In early times, he was occasionally designated the *Lord Lyon*; but the now prevalent custom of so calling him, seems to have arisen from the circumstance that, since 1793, the office has been held by a peer. According to Nisbet, the Lyon has precedence of all knights and gentlemen not being officers of state, or senators of the College of Justice. Since the Union, he has ranked next to Garter; Clarencieux and Norroy follow; then Ulster; but it has sometimes been maintained that, within Ireland, Ulster has place next after Lyon. The regalia of the Lyon, worn on solemn occasions, consist of a crown of gold, an embroidered crimson velvet robe with the national arms, a triple row of gold chains, with a medal, exhibiting the royal bearing on the one side, and St Andrew's Cross on the other. At other times, the badge is worn suspended by a broad green ribbon.

The official arms of the Lyon King-at-arms are argent, a lion sejant full-faced gules, holding in the dexter paw a thistle slipped vert, and in the sinister an escutcheon of the second, on a chief azure a saltire of the first. Lyon is king-at-arms to the order of the Thistle (q. v.). See **LYON COURT**.

LYONNAIS, a former province of France, was bounded on the W. by Auvergne, and on the E. by Languedoc. Its territory coincides nearly with the present departments of Rhone, Loire, Haute-Loire, and Puy-de-Dôme.

LYRE, the oldest stringed instrument of the Egyptians and Greeks. There are many different kinds and sizes of the lyre, each having its own peculiar name, such as the *Lyra da Braccio*, *Lyra da Gamba*, *Lyre Guitare*, &c.

LYRE-BIRD, or **LYRE-TAIL** (*Menura*), a genus of birds, of which the best known species (*M. superba*) is a native of New South Wales, where it is generally called the **LYRE PHRASEANT**. The proper place of this genus has been much disputed by ornithologists, some placing it among the *Insector*, near to thrushes and wrens, others among Gallinaceous Birds, with megapodes. The large feet and habit of scraping, ally the L. with the latter; the form of the bill, the bristles at the base of the bill, and above all, its musical powers, connect it with the former, to which it was unhesitatingly referred by Cuvier. It is a bird about the size of a pheasant, frequenting the brush, or sparsely-wooded country, in the unsettled parts of New South Wales, but retreating from the more inhabited districts. It is extremely shy and difficult to approach. It is by far the largest of all song-birds. It possesses the power of imitating the song of other birds. The tail of the male is very remarkable and splendid, the twelve feathers being very long, and having very fine and widely separated barbs; whilst, besides these, there are two long middle feathers, each of which has a vane only on one side, and two exterior feathers, curved like the sides of an ancient lyra. The L. makes a domed nest.—A second species (*M. Alberti*), also

Australian, has recently been discovered, and has been named in honour of the late Prince Albert.

Lyre-Bird (*Menura superba*).

The lyre-shaped feathers of the tail are comparatively short.

LYRIC (from the Gr. *lyra*, a lyre), the name given to a certain species of poetry, because it was originally accompanied by the music of that instrument. Lyric poetry (see **EPIC POETRY**) concerns itself with the thoughts and emotions of the composer's own mind, and outward things are regarded chiefly as they affect him in any way. Hence it is characterised as *subjective*, in contradistinction to epic poetry, which is *objective*. Purely lyrical pieces are, from their nature, shorter than epics. They fall into several divisions, the most typical of which is the *song*, which is again subdivided into *sacred* (hymns) and *secular* (love-songs, war-songs, comic songs, &c.).

LYS, or **LEYE**, a tributary of the Scheldt, rises in France near the little town of Lysbourg, in the department of Pas-de-Calais, and flows in a north-eastern direction, joining the Scheldt at Ghent in Belgium after a course of 100 miles. The L. once formed the boundary between France and Germany.

LYSANDER, a famous Spartan warrior and naval commander, of extraordinary energy and military skill, but not less remarkable for the cunning, revenge, and ambition by which he was characterised. He spent part of his youth at the court of Cyrus the Younger, and in 407 B.C. was appointed to the command of the Spartan fleet, from which time he constantly prosecuted the design of overthrowing the Athenian power, in order to exalt that of Sparta. He defeated the Athenian fleet at the promontory of Notion; and being again intrusted with the management of the fleet, after the defeat of his successor, Callicratidas (405 B.C.), he was again victorious. He swept the southern part of the Ægean, and made descents upon both the Grecian and the Asiatic coasts. He then sailed north to the Hellespont, and anchored at Lampacus. An immense Athenian fleet soon made its appearance at Egospotami, on the opposite side of the straits, amounting to 180 ships. Of these, 171 were captured by L. a few days after.

The blow to Athens was tremendous. Everywhere, her colonial garrisons had to surrender, and Spartan influence predominated. Finally, in 404 B.C., he took Athens itself. His popularity now became so great, especially in the cities of Asia Minor, that the Spartan ephors dreaded the consequences, especially as they knew how ambitious he was. Every means was taken to thwart his designs, until finally it would appear that he had resolved to attempt the overthrow of the Spartan constitution; but this scheme was prevented by his death at the battle of Haliartus in the Boeotian war (395 B.C.).

LYTHRA'CEÆ, a natural order of exogenous plants, consisting of herbaceous plants, with a few shrubs; the branches frequently four-cornered. The leaves are generally opposite, entire, and sessile. The flowers are solitary or clustered, regular or irregular, and either axillary, racemose, or spiked; the calyx tubular, the petals inserted into the calyx, very deciduous, sometimes wanting. The stamens are inserted into the tube of the calyx below the petals, sometimes equal to them in number, sometimes twice or thrice as many. The ovary is superior, generally 2-6-celled. The fruit is a membranous capsule with numerous seeds.—There are about 300 known species, natives of tropical and temperate, or even of cold climates. Some of them are occasionally applied to medicinal uses, upon account of astringent, narcotic, or febrifugal properties. Among those thus employed is the **PURPLE LOOSESTRIFE** (*Lythrum salicaria*), a common British plant, growing in moist places and about the margins of ponds and streams, with beautiful leafy spikes of purple flowers; a decoction of either the root or the dried leaves of which is sometimes advantageously used in diarrhoea. The Henna (q. v.) of Egypt is produced by *Lawsonia inermis*, a plant of this order. The leaves of another (*Pemphis acidula*) are said to be a common pot-herb on the coasts of the tropical parts of Asia. The leaves of *Ammanis vesicatoria*, an East Indian aquatic plant, are very acrid, and are sometimes used as blisters.

LYTTLETON, GEORGE LORD, son of Sir Thomas Lyttleton of Hagley, in Worcestershire, was born in 1708-1709, and educated at Eton and Christchurch, Oxford. He entered parliament in 1730, held several high political offices, was raised to the peerage in 1759, and died in 1773. L. had once a considerable reputation as an author. His best known works are *Observations on the Conversion and Apostleship of St Paul* (1747), *Dialogues of the Dead* (1760), and *History of Henry II.* (1764).—He had a son, **THOMAS, LORD LYTTLETON**, who died young, and who was as conspicuous for profligacy as his father for virtue.

LYTTON, SIR EDWARD GEORGE EARLE LYTTON BULWER, Bart., the youngest son of General Bulwer of Woodalling and Haydon Hall, Norfolk, was born in 1805, and received his education at Cambridge, where he graduated B.A. in 1826, and M.A. in 1835. He is distinguished as an English writer and as a politician, and his achievements in these diverse fields may be noticed separately.

His first publication was a poem on *Sculpture*, which gained the Chancellor's prize for English versification at Cambridge in 1825. In 1826, he published a collection of miscellaneous verse, entitled *Weeds and Wild Flowers*, and in the year following, a tale in verse with the title *O'Neill, or the Rebel*. In 1827, his first novel, *Falkland*, was published anonymously. Next year, he published *Pelham*, which astonished the critics by its cynicism and its icy glitter of epigram. *The Disowned, Devereux*, and *Paul Clifford* followed in rapid succession. In 1831, he broke into more passionate and tragical regions in *Eugene*

Aram, and after that ceased for a period to convulse the libraries. About this time, he succeeded Campbell as editor of *The New Monthly Magazine*, and contributed to its pages a series of papers which were afterwards collected under the title of *The Student*. In 1833, he produced his *England and the English*. In 1834, he returned to fiction, and published in an illustrated form *The Pilgrims of the Rhine*. This was followed by *The Last Days of Pompeii*, a work of a higher class than any of his former productions. *Rienzi* followed in the same splendid vein, and received the same admiration. His next work was a play in five acts, *The Duchess of La Vallière*, which was put on the stage in 1836, and failed. *Ernest Maltravers* came the year after, which, as containing his views on art and life, has ever been a favourite with his more thoughtful readers. In the same year, he published *Athen: its Rise and Fall*, full of research and splendid rhetoric. *Leila* and *Calderon* appeared in 1838. His next efforts were in the difficult walk of the drama, in which he had formerly failed. He produced *The Lady of Lyons* and *Richelieu*, both of which remain among the most popular of modern English plays.

L.'s next important work was *Zanoni*, which was published in 1842, and in the same year appeared his poem entitled *Eva*, which is little read now. Other poems were issued about this time—*The New Timon* in 1846, and *King Arthur* in 1848, neither of which has been successful, although in the former there are couplets turned with the grace and art of Pope; and the latter contains noble passages of sentiment, and much glittering description. His next novels were *The Last of the Barons*, *Harold*, and *Lucretia*; and thereafter he adopted a new walk of fiction, and achieved in it his greatest triumphs.

The Caxtons, a domestic novel, appeared originally in *Blackwood*, and gave the world the crowning proof of L.'s versatility. This work was followed by *My Novel*, which is in several respects the finest thing he has done. Since then, he has published, also in the first instance in *Blackwood*, *What will He do with It?* a novel, in which his earlier style is reverted to; and a clever poem entitled *St Stephen's*. In 1861, *A Strange Story* appeared in *All the Year Round*, and at present (1863) he is contributing to *Blackwood* a series of essays under the title of *Caxtoniana*.

At the age of 23, L. entered parliament as member for St Ives, and attached himself to the Reform party. In 1832, he was returned as member for Lincoln, and held that seat till 1841. In 1833, he received his baronetcy from the Melbourne administration ostensibly for brilliant services rendered to his party as a pamphleteer. In 1844, he succeeded, on the death of his mother, to the Knebworth estates, and sought to return to parliament; in 1847, he contested Lincoln unsuccessfully; and in 1852, he was returned as member for the county of Hertford, and attached himself to the party headed by Lord Derby. During the late Derby administration, he held the post of Colonial Secretary. He does not shine as a debater, but several of his parliamentary speeches have been eloquent and telling.

Of living English men of letters, L. is perhaps the most versatile, and has been the most generally successful. He has written novels, dramas, criticism, history, poems, political pamphlets, and each of these he has written well, several supremely well. If he has failed at all, he has failed as a poet, and his failure may be accounted for to some extent from his having chosen models which ran counter to the prevailing taste. On his novels, however, his reputation must ultimately rest. These have become part and parcel of English literature, and may now be considered as among its permanent glories.

M

THE thirteenth letter of the English alphabet, is the labial letter of the class of liquids. See LETTERS. Its Hebrew name is *Mem*, i.e., 'water,' and its original form was probably a waving line representing water.

M is liable to many changes, and often disappears altogether. The Greek *molubdos* corresponds to Lat. *plumbum*; an old form of Lat. *bonus*, *venus*, or *belus*, was *manus*, which probably accounts for the comparative *melior*. See B. Final *m* in Latin was pronounced with such a weak, undecided sound, that it was proposed to write it with half the letter; hence also, before the spelling of the language had become fixed, it had in many cases been altogether dropped, as in *lego* for *legom*. See INFLECTION. The nasal sound of final *m* in French seems to be a relic of the Roman pronunciation.

MAAS (Lat. *Mosa*, Fr. *Meuse*), a large affluent of the Rhine, rises in France, in the department of Haute-Marne, near the village of Meuse, flows in a northerly direction through France, Belgium, and Limburg, and then eastward through Holland to the German Ocean. From its junction with the Waal, a branch of the Rhine, to the mouth of the Yssel, it is called the Merve. At Dordrecht, it divides into two branches, enclosing the island of Ysselmonde—of these, the northern is called the Nieuwe Maas (New Maas), the southern the Oude Maas (Old Maas). These branches unite on the eastern side of the island of Rozenburg, after which the river falls into the North Sea, in long. 4° 5' E. Its entire course is 552 miles in length, for 430 miles of which (from Verdun, in the department of Vooges, France, to the mouth of the river) it is navigable. The area drained by the M. is estimated at 19,000 square miles. Its principal affluents are the Sambre and the Dieze, on the left; and the Ourthe, the Roer, and the Niers, on the right. Of the important towns on the banks of the M., the principal are Namur, Liège, Maastricht, Gorkum, Dort, and Rotterdam.

MAASTRICHT, or MAESTRICHT (called by the Romans *Trajectum ad Mosam*, to distinguish it from *Trajectum ad Rhenum*, now Utrecht), is a very old and important fortified town, capital of the province of Limburg, kingdom of the Netherlands. Pop. in 1861, 27,805. M. is on the left bank of the river Maas, which separates it from the town of Wijk, the connection being maintained by a stone bridge, 500 feet in length, resting on nine arches, and defended by small fortified islands. The town was founded in the 6th c., the seat of the bishop being transferred thither after Attila had plundered Tongres, in 451. It is 15 miles north of Liège, 18 west of Aix-la-Chapelle (Aken), and pleasantly situated in a hilly district. The streets are broad, and the houses regularly and well built, giving an air of beauty and respectability

to the town. There are many paintings and a select public library in the Town-house, a large square stone building, ornamented with a tower, and standing on the great market. M. has one Lutheran, three Dutch Reformed, and six Roman Catholic churches; three hospitals, two orphan-houses, an Athenæum, and other public buildings. The plains are shaded with trees and refreshed by fountains. A broken Brabant dialect, mingled with German and Walloon, is the language commonly spoken; but in all respectable families, French is chiefly used. M. has a very considerable trade with Boisle-Duc and other places. Leather, woollen stuffs, stockings, blankets, flannels, starch, madder, pins, &c., are manufactured; soap-boiling, gin-distilling, sugar-refining, iron-founding, and other branches of industry, adding also to the prosperity of the town.

M. has often felt the scourge of war, and the evils incident to a frontier fortified town. It is surrounded by broad and deep canals, which contribute to its defensive strength. It is commanded by the hill of St Pierre, formerly called *Mons Hunnorum*, a soft calcareous mountain, which has been very extensively mined, forming a cavernous labyrinth of several leagues in length. Among other fossils, have been found in these workings two heads of the gigantic *Mossasaurus*.

MABILLON, JEAN, a learned Benedictine, born 23d November 1632, at St Pierre-mont, in Champagne. He studied at the Collège de Reims; assisted D. Luc d'Achery in his labours upon his vast historic *recueil*, entitled *Spicilegium*; undertook an edition of the works of St Bernard; and in 1663, published the first volume of the *Acta Sanctorum Ordinis S. Benedicti*, of which the last part appeared in 1702. His classical work *De Re Diplomatica* appeared at Paris in 1681. Colbert offered him a pension of 2000 livres, but he declined it. In 1683, Colbert sent him to Germany, to collect documents relative to the history of France, and he was afterwards sent to Italy for a similar purpose. He died in Paris, 27th December 1707. His *Vetere Analecta* (4 vols. Par. 1675—1685), and *Musæum Italicum, seu Collectio Veterum Scriptorum ex Bibliothecis Italicis eruta* (2 vols. Par. 1687—1689), contain part of the fruits of his laborious and erudite researches.

MAC, or M', a Gaelic prefix occurring frequently in Scottish names, means 'son,' and is probably allied to the Gothic *magus*, a son, a boy, the feminine of which is *magatha* (Ger. *magde*, a maid). The root is probably the Sanscrit *mah*, to grow (see G). In Welsh, *magu* means to breed. The Welsh form of *Mac* is *Map*, shortened into 'ap or 'p, as Ap Richard, whence Prichard.

MACADAM, JOHN LOUDON, was born in Scotland in 1756, and passed his youth in the United States. On his return, he was appointed manager of a district of roads in Ayrshire, and originated and successfully practised the system of roadmaking now known by his name. In 1819, he was summoned to England, and was appointed by parliament

to superintend the roads in the Bristol district, which were in a most deplorable condition. In 1827, he was appointed general surveyor of the metropolitan roads; and in reward of his exertions to render them efficient, received a grant of £10,000 from government. His system rapidly became general throughout England, and was also introduced into France with great success. M. died at Moffat, in Dumfriesshire, in 1836. The principles of his system, which is known as *Masadamising*, are as follow: 'For the foundation of a road, it is not necessary to lay a substratum of large stones, pavement, &c., as it is a matter of indifference whether the substratum be hard or soft; and if any preference is due, it is to the latter. The metal for roads must consist of broken stones (granite, flint, or whinstone is by far the best); these must in no case exceed 6 ounces each in weight, and stones of from 1 to 2 ounces are to be preferred. The large stones in the road are to be loosened, and removed to the side, where they are to be broken into pieces of the regulation weight; and the road is then to be smoothed with a rake, so that the earth may settle down into the holes from which the large stones were removed. The broken metal is then to be carefully spread over it; and as this operation is of great importance to the future quality of the road, the metal is not to be laid on in shovelfuls to the requisite depth, but to be scattered in shovelful after shovelful, till a depth of from 6 to 10 inches, according to the quality of the road, has been obtained. The road is to have a fall from the middle to the sides of about 1 foot in 60, and ditches are to be dug on the field-side of the fences to a depth of a few inches below the level of the road.' This system, which at one time threatened to supersede every other, is calculated to form a hard and impermeable crust on the surface, thus protecting the soft earth below from the action of water, and so preventing it from working up through the metal in the form of mud. Strange to say, it has succeeded admirably in cases where a road had to be constructed over a bog or morass, but in some other circumstances, it has been found deficient. See **ROADS**.

MACAO, a Portuguese possession on the coast of China, in lat. 22° 16' N., and long. 113° 40' E., on the western part of the estuary of the Canton or Pearl River, Hong-kong being about 40 miles distant, on the opposite side of the same estuary. The settlement, which is about eight miles in circuit, is on a small peninsula, projecting from the south-eastern extremity of the large island of Hiang-shan. Its position is very agreeable, nearly surrounded with water, and open on every side to the sea-breezes, having a good variety of hill and plain, and a large island adjacent, on which are pleasant rambles, to be reached by equally pleasant boat-excursions. It is one of the most salubrious parts east of the Cape of Good Hope, and during the monopoly of the East India Company, it was a favourite place of resort for Englishmen from India. The population is about 30,000, 5000 of whom are Portuguese and other foreigners. The Portuguese obtained their footing in 1560, under the pretext of erecting sheds for drying goods, introduced under the appellation of tribute, and alleged to have been damaged in a storm. These sheds gradually gave way to substantial edifices, and finally to forts. Thus the first foreign colony in China was established. The Chinese, however, held, until recently, a lien upon the place, requiring of the Portuguese 500 taels ground-rent, retaining also jurisdiction over their own people. The privileges obtained by England through the treaty of Nankin, were subsequently extended to the Portuguese, who,

by successive aggressions, have become wholly independent of the Chinese. The Typa anchorage lies between two small islands about three miles of the southern end of the peninsula. Large vessels cannot approach nearer the shore than six miles. There is an inner harbour on the west of the town, the resort of small vessels and junks. After the rise of Hong-kong, the commerce of M. almost entirely disappeared; but the authorities have of late been doing what they can to revive the prosperity of the place, by making it a free port, and by the pursuance of a liberal policy generally.

MACARONI (originally lumps of paste and cheese squeezed up into balls; from It. *maciare*, to bruise or crush), a peculiar manufacture of wheat, which for a long time was peculiar to Italy, and in fact, almost to Genoa; it is now, however, made all over Italy, and at Marseille and other places in the south of France. Strictly speaking, the name macaroni applies only to wheaten paste in the form of pipes, varying in diameter from an ordinary quill up to those now made of the diameter of an inch; but there is no real difference between it and the fine threadlike vermicelli, and the infinite variety of curious and elegant little forms which, under the name of *Italian pastes*, are used for soups.

Only certain kinds of wheat are applicable to this manufacture, and these are the hard sorts, which contain a large percentage of gluten. At present, the Italian manufacturers prefer the wheats of Odessa and Taganrog; but they also employ those of their own country grown in Sicily and in Apulia. The wheat is first ground into a coarse meal, from which the bran is removed—in that state it is called *Semola* (see also **SEMOLINA**); during the grinding, it is necessary to employ both heat and humidity, to insure a good semola. The semola is worked up into a dough with water; and for macaroni and vermicelli, it is forced through gauges, with or without mandrels, as in wire and pipe-drawing; or for *pastes*, it is rolled out into very thin sheets, from which are stamped out the various forms of stars, rings, &c.

The manufacture of this material is of great importance to Italy, where it forms a large article of home consumption, and is exported to all parts of the world. In Genoa alone, nearly 170,000 quintals of wheat are annually consumed in this manufacture. The finest qualities of macaroni are those which are whitest in colour, and do not burst or break up in boiling; it should swell considerably, and become quite soft; but if it does not retain its form when boiled, it has not been made of the best wheat. Some makers flavour and colour it with saffron and turmeric, to suit certain tastes, but this is limited to very few. The use of macaroni and its varieties is rapidly increasing in Great Britain, where it is employed in soups, in puddings, and for making the favourite dish of macaroni and cheese.

MACARONIC VERSE is properly a kind of humorous poetry, in which, along with Latin, words of other languages are introduced with Latin inflections and construction; but the name is sometimes applied to verses which are merely a mixture of Latin and the unadulterated vernacular of the author, of which a very clever specimen are the lines of Porson on the threatened invasion of England by Bonaparte, entitled *Lingo dressa for the Militia* (see Wheatley's *Anagrams*, &c.). Teofilo Folengo, called Merlino Cocciajo, a learned and witty Benedictine, who was born at Mantua in 1484, and died in 1544, has been erroneously regarded as the inventor of macaronic poetry; but he was the first to employ the term, selected with reference to the mixture of ingredients in the dish

called macaroni. His *Macaronia* (Tusculanum, 1521, and many editions) is a long satiric poem, in which Latin and Italian are mingled. Fortunately, macaronic poetry has not been very extensively cultivated, although specimens of it may be found in the literature of almost all European countries. The idea of it was probably first suggested by the barbarous monkish Latin. There is a history of macaronic poetry, and a collection of the principal works of this kind by Genthe (Halle, 1829).—Compare also Octave Delepierre's *Macaroniana* (Paris, 1852), and his *De la Littérature Macaronique et de quelques Raretés Bibliographiques de ce Genre* (vol. II., *Miscellanées of Philobiblon Society*, Paris, 1856).

MACAROON (from the same root as Macaroni), a favourite kind of biscuit, made with the meal of sweet almonds, instead of wheaten or other flour. The most esteemed formula for making macaroons is either prepared almond-meal dry, or, what is still better, almonds just blanched and beaten into a paste, one pound, thoroughly incorporated with a pound and a half of refined sugar in powder, an ounce of the yellow part of fresh lemon-peel grated fine, and the whites of six eggs. When thoroughly mixed, the paste is made into the shape of small oval biscuits, and placed on sheets of water-paper, and baked; afterwards, the superfluous water-paper is trimmed off, and the macaroons are ready for use.

MACARTNEY COCK (*Euplocamus ignitus*), a splendid gallinaceous bird, also called the FIRE-BACKED PHASANT, a native of Sumatra and other islands of the same part of the world. It was first described in the account of Lord Macartney's embassy to China. The entire length of the adult male is about two feet. The sides of the head are

(Impeyan). Two or three splendid East Indian species are referred to it.

MACASSAR, the most southern portion of Celebes (q. v.), lies in lat. $4^{\circ} 35'$ — $5^{\circ} 50'$ S., and long. $119^{\circ} 25'$ — $120^{\circ} 30'$ E.; and is traversed by a lofty chain of mountains. M. was formerly the greatest naval power among the Malay states, but is now divided into the Dutch possessions and M. Proper, which is of little importance, and governed by a native king, who pays tribute to the Netherlands. The natives are among the most civilized and enterprising, but also the most greedy, of the Malay race. They carry on a considerable trade in tortoise-shell and edible nests, grow abundance of rice, and raise great numbers of horses, cattle, sheep, and goats; fishing is also extensively carried on. The Macassars are chiefly Mohammedans; the mosques are built of palm-wood. They are warlike, spirited, and impatient of a blow—their laws allowing them to avenge it by the death of the offender, if within three days.

MACASSAR, the chief town, is the capital of all the possessions of the Netherlands in Celebes, and the residence of the governor and officials. It is situated on the Strait of Macassar, which separates Celebes from Borneo, in $5^{\circ} 10'$ S. lat., and $119^{\circ} 20'$ E. long.; and is built upon a high point of land, watered by two rivers and other smaller streams, surrounded by palisades, and further defended by Fort Rotterdam. Pop. about 12,000. The harbour is safe and convenient, but difficult to enter. Climate healthy, and all kinds of provisions plentiful. The exports consist of the various products of Celebes, which are brought from the settlements to Macassar for shipment. The chief of these are rice, sandal-wood, ebony, tortoise-shell, gold, spices, &c. The imports from China are principally silk fabrics and porcelain; from the Netherlands, cotton and linen goods, firearms, opium, spirits, &c. A very large proportion of the export and import trade is carried on between Macassar and the free port of Singapore, about a third part being with Java. In 1857, the imports amounted to £382,288, and the exports to £385,010 sterling. No import or export duties are charged.

The Portuguese first formed a settlement in M., but were supplanted by the Dutch, who, after many contests with the natives, gradually attained to supreme power. In 1811, M. fell into the hands of the British, who, in 1814, defeated the king of Boni, and compelled him to give up the regalia of Macassar. In 1816, it was restored to the Dutch, and continues to enjoy a fair share of the mercantile prosperity of the Netherlands' possessions in the Eastern Archipelago.

MACASSAR OIL—so called from the district of Macassar, in the island of Celebes, whence it is exported—is a species of vegetable butter, of an ashen-gray colour, and rancid odour.—This name has also been given in Britain to a patent preparation used for promoting the growth of the hair and preventing its decay. It is composed of olive oil, or oil of almonds, coloured with Alkanet root, and mixed with perfumes.

MACAULAY, THOMAS BABINGTON, LORD, son of Zachary Macaulay, a West India merchant and eminent philanthropist, and grandson of the Rev. John Macaulay, a Presbyterian minister in the west of Scotland, was born at Rothley Temple, Leicestershire, 25th October 1800. He entered Trinity College, Cambridge, at the age of 18, where he acquired a brilliant reputation both as a scholar and debater. He twice won the Chancellor's medal—first in 1818, for a poem on Pompeii, and again in 1820, for another on *Evening*, both of which were

Macartney Cock (*Euplocamus ignitus*).

covered with a bluish-purple skin. The crown of the head has an upright crest of feathers with naked shaft, and a number of slender spreading barbs at the tip. The tail, when depressed, is forked; when erect, it is slightly folded, as in the common fowl. The general colour is a deep black, with blue metallic reflections; the middle of the back, brilliant orange; the tail, bluish green, orange, and white. The female is smaller, and almost entirely of a rich brown colour. The head is not crested, as in the male, but the hind feathers are lengthened.—The genus *Euplocamus* is allied both to *Gallus* (Fowl) and *Phasianus* (Pheasant), and perhaps still more nearly to *Lophophorus*

published. In 1821, he obtained the second Craven scholarship, took the degree of B.A. in 1822, was shortly after elected a Fellow of Trinity, and then began to devote himself zealously to literature. The periodical to which he first contributed was *Knights Quarterly Magazine*; for this he wrote several of his ballads, e. g., *The Spanish Armada*, *Moncontour*, and *The Battle of Ivery*, besides essays and critiques. In 1825, he took the degree of M.A., and in the same year made his appearance in the columns of the *Edinburgh Review* by his famous essay on Milton, the learning, eloquence, penetration, brilliancy of fancy, and generous enthusiasm of which, quite fascinated the educated portion of the public. For nearly 20 years he was the popular, perhaps also the most distinguished, contributor to the 'Blue and Yellow.' In 1826, he was called to the bar at Lincoln's Inn, but it does not appear that he practised. The tide of political agitation was beginning to rise high, and M. was borne along with the current. There can be no doubt that M. was an immense accession to the Whig party; for he believed in Whiggism with a profound sincerity that has never been questioned; and he was able to present the grounds of his belief in a manner so powerful and attractive, that his very opponents were charmed, and almost convinced. In 1830, he entered parliament for the pocket-borough of Calne (which was placed at his service by the Marquis of Lansdowne) just in time to take part in the memorable struggle for Reform, in favour of which he made several weighty and effective speeches. When the first reformed parliament assembled in 1832, M. sat as member for Leeds, and at once took a prominent position in the House. He was now made Secretary of the Board of Control for India; and in the following year, went out to India as a member of the Supreme Council. Here he remained till 1838. His chief labour was the preparation of a new Indian penal code. A conspicuous feature of this code was the humane consideration it displayed for the natives (which drew down upon its author the hostility of the Anglo-Indians); but in spite of the high ability shewn in framing it, it was found on the whole unworkable, and was abandoned. On his return to England, he resumed his political career, and was elected M.P. for the city of Edinburgh in 1839. In 1840, he was appointed War-secretary. While holding this office, he composed, appropriately enough, those magnificent martial ballads, the *Lays of Ancient Rome* (1842); and in the following year, published a collected series of his *Essays*, in 3 vols. In 1846, he was made Paymaster-general. M. had always been one of the most courageous and unflinching advocates of religious freedom: accordingly he had defended the Roman Catholic Relief Bill; his first speech in the House of Commons was in support of the bill to repeal the Civil Disabilities of the Jews, and now he supported the Maynooth grant. At this period, unfortunately for M., Edinburgh was the arena of great ecclesiastical fermentation; and because he advocated a measure intended to moderate the natural discontent of Roman Catholics, he was ousted from his seat at the general election in 1847. Five years later (1852), Edinburgh did what it could in the way of reparation, by re-electing M. without a single movement made by him on his own behalf. In 1848, appeared the first two volumes of his *History of England from the Accession of James II.*, the popularity of which must have made even successful novelists envious; next year, he was chosen Lord-rector of the university of Glasgow, on which occasion he received the freedom of the city. When the third and fourth volumes of his *History* were published in 1855, they occasioned a

furore of excitement among publishers and readers, 'to which,' it is said, 'the annals of Paternoster Row hardly furnish any parallel.' In 1857, the French Academy of Moral and Political Sciences made him a foreign associate; and in the course of the same year, he was raised to the peerage of Great Britain under the title of Baron M. of Rothley. His health, however, had long been failing, and on the 28th of December 1859, he expired somewhat suddenly at his residence, Holly Lodge, Campden Hill, Kensington, London. He was buried in Westminster Abbey. A collection of his Miscellaneous Writings was published at London, in 2 vols. (1860).

M. was indisputably a man of splendid talent. His scholarship—in the strictly classical sense of the term—was admirable; his miscellaneous literary acquisitions were something prodigious; his knowledge of modern European, and especially of English history from the age of Henry VIII. down to his own, was unsurpassed—we might with safety say, unequalled; in addition, he had a sagacity and swiftness of understanding that enabled him to comprehend and rapidly methodise his vast array of facts; and what is perhaps more wonderful than all, his style is not in the least affected by the immensity of his attainments. He 'wears all his load of learning lightly as a flower.' In ease, purity, grace, force, and point, he rivals those who have made felicity of style their chief study. He has been accused of partiality, of exaggeration, and of gratifying his passion for epigram at the expense of truth; his *History* has been termed a 'huge Whig pamphlet;' and strong exception has been taken to particular passages, where his views appear to some to be biased by personal antipathies, such as his description of Scotland, the Highlands, the massacre of Glencoe, Marlborough, Penn., &c.; but the essential truth and accuracy of his narrative, as a whole, has never been disproved.

MACAW (*Macrocerus*), a genus of the parrot family (*Psittacidae*), distinguished by a very long wedge-shaped tail, long and pointed wings, large strong feet, the sides of the head naked, the bill short and very strong, the upper mandible greatly arched, and having a long sharp tip, the lower mandible much shorter, and of massive thickness. The species are among the largest and most splendid of the parrot race; they are all natives of tropical America. They do not readily learn to articulate, their attainments seldom exceeding one or two words, but are easily domesticated, and become much attached to those with whom they are well acquainted. Their natural notes are hoarse and piercing screams. They are more or less gregarious, and the appearance of a flock of macaws in bright sunshine is wonderfully brilliant. They breed twice a year, and lay their eggs—generally two—in the hollows of decayed trees. They feed chiefly on fruits and seeds; and often commit great depredations on fields of maize. One of the flock is set to watch on some elevated situation, and on the approach of danger, gives the alarm by a cry. In domestication, macaws readily eat bread, sugar, &c.—The GREAT SCARLET M. (*M. aracanga*) is sometimes more than three feet in length, including the long tail.—The GREAT GREEN M. (*M. miliaris*) and the BLUE AND YELLOW M. (*M. ararauna*) are rather smaller. These are among the best known species. The other species are numerous.—Allied to the macaws, but approaching to the parakeets, are the species forming the genus *Psittacara*, all of them also natives of the New World. The cheeks are feathered, and the bill less arched than in the true macaws.—Allied to them also are the *Arara*, of which one, the CAROLINA ARARA, or CAROLINA

PARROT (*Arara Carolinensis*), extends much further north in America than any other of the parrot family. It is about fourteen inches long, gay with

feeling northwards across the mountain-range since called the Grampians, he was slain at Lumphannan, in Aberdeenshire, on the 5th of December 1058. His followers were able to place his nephew, or step-son, Lulach, on the throne; and his defeat and death at Essie, in Strathbogie, on the 3d of April 1057, opened the succession to Malcolm, who, three weeks afterwards, was crowned at Scone. This is all that is certainly known of the history of Macbeth. The fables which gradually accumulated round his name were systematised in the beginning of the 16th c. by the historian Hector Boece, from whose pages they were transferred to the Chronicle of Hollinshed, where they met the eye of Shakspeare. Nearly half a century before his great play was written, Buchanan had remarked how well the legend of M. was fitted for the stage.

MA'OCABEES, a word of uncertain meaning and origin. The founder of the Maccabean dynasty, Matithjahu (Asamonaia, Chashmonai), a priest (not, as generally supposed, a high-priest, nor even of the family of high-priests), was the first who made a stand against the persecutions of the Jewish nation and creed by Antiochus Epiphanes. At the beginning of the troubles, he had retired, together with his five sons, Jochanan (Gaddes—Kaddiah), Simon (Tassi—Mathes), Jehudah (Makkabi), Eleazar (Avaran—Syr. Chavin), Jonathan (Apphus), to Modiin, a small place between Jerusalem and Joppa, to mourn in solitude over the desolation of the holy city and the desecration of the temple. But the Syrians pursued him thither. He being a person of importance, Apelles, a Syrian captain, endeavoured to induce him, by tempting promises, to relinquish his faith, and to embrace the Greek religion. He answered by slaying with his own hand the first renegade Jew who approached the altar of idolatry. This gave the sign to a sudden outbreak. His sons, together with a handful of faithful men, rose against the national foe, destroyed all traces of heathen worship, already established in Modiin and its neighbourhood, and fled into the wilderness of Judah. Their number soon increased; and not long after, they were able to make descents into the adjacent villages and cities, where they circumcised the children, and restored everywhere the ancient religion of Jehovah. At the death of Mattathiah (166 B.C.), which took place a few years after the outbreak, Judah Makkabi (166—161 B.C.) took the command of the patriots, and repulsed the enemy, notwithstanding his superior force, at Mispah (8000 against 70,000), Bethsur (10,000 against 65,000), and other places, reconquered Jerusalem, purified the temple (Feast of Reconsecration—Chanuka), and reinaugurated the holy service (164 B.C.). Having further concluded an alliance with the Romans, he fell in a battle against Bacchides (161 B.C.). His brother Jonathan, who succeeded him in the leadership, renewed the Roman alliance, and taking advantage of certain disputes about the Syrian throne, rendered vacant by the death of Antiochus, acquired the dignity of high-priest. But Tryphon, the guardian of the young Prince Antiochus Theos, fearing his influence, invited him to Ptolemais, and had him there treacherously executed. Simon, the second brother, was elected by the Jewish commonwealth to assume the reins of the national government, and was formally recognised both by Demetrius, Tryphon's antagonist, and by the Romans as 'chief and ruler of the Jews.' He completely re-established the independence of the nation, and the year after his succession (141 B.C.) was made the starting-point of a new era. The almost absolute power in his hands he used with wise moderation; justice and righteousness flourished in his

Macaw.

green and gold, is gregarious, and commits great depredations in orchards and maize-fields. It cannot be taught to articulate words, but readily becomes very familiar.

MACAW-TREE, GREAT (*Acrocomia sclerocarpa*), a palm of the same tribe with the cocoa-nut, a native of the West Indies, and of the warm parts of America. It is called *Macoya* in Guiana, and *Macahuba* in Brasil. It is from twenty to thirty feet high, with pinnated leaves, from ten to fifteen feet long. The fruit yields an oil, of a yellow colour, of the consistence of butter, with a sweetish taste, and an odour of violets, used, in the native regions of the tree, as an emollient in painful affections of the joints, and extensively imported into Britain, where it is sometimes sold as *Palm Oil*, to be used in the manufacture of toilet-soaps.

MACBETH (or **MACBETHAD** **MACFINLEIGH**, as he is called in contemporary chronicles), a king of Scotland, immortalised by the genius of Shakspeare. From his father Finlegh, the son of Ruedri, he inherited the rule of the province of Moray; and he became allied with the royal line by his marriage with Gruoch MacBoedha, the granddaughter of King Kenneth MacDuff. In the year 1039, he headed an attack upon King Duncan MacCrinan, at a place called Bothgouanan (the 'Smith's Bothy'), where the king was mortally wounded, but survived to be carried to Elgin, in Moray. M. now ascended the throne, and his reign of 17 years is commemorated in the chronicles as a time of plenty. He made grants to the Culdees of Loch Leven, and in the year 1050, went in pilgrimage to Rome. Malcolm MacDuncan, or Canmore, the eldest son of King Duncan MacCrinan, had fled to England on his father's death; and, in the summer of 1064, his kinsman, Siward, Earl of Northumberland, led an English army into Scotland against Macbeth. That king was defeated, with great slaughter, but escaped from the field, and still kept the throne. Four years afterwards, he was again defeated by Malcolm MacDuncan, and

days, and 'Judah prospered as of old.' But not long (seven years) after his accession to the supremacy, he was foully murdered (136 B.C.) by his own son-in-law, Ptolemy, who vainly hoped to succeed him. For the subsequent history of this family, see JEWS; HYRCANUS; and HEROD. The Feast of the Maccabees—i.e., both of the sons of Mattathiah, and of the seven martyr children (2 Mac. 7)—is found in the Roman martyrology under the date of the first of August.

MACCABEES, BOOKS OF, certain apocryphal writings of the Old Testament, treating chiefly of the history of the Maccabees (q.v.). They are usually divided into four parts, or books; the first of which—the most important—comprising the period 175—135 B.C., relates the events which took place in Judaea, Antiochus IV. Epiphanes' misdeeds against the temple, the city, and the nation (ch. i.—ii.); the rising of Mattathiah and his sons against the oppressor, the heroic deeds of Judah Maccabeus (iii.—ix.), of Jonathan (ix.—xii.), and Simon, until the election of Johannes Hyrcanus to the dignity of high-priest. The account, which bears the aspect of strict truthfulness, proceeds chronologically after the Seleucidian era. According to Origen and Jerome, this book was originally written in Hebrew. The author, probably a Palestinian, composed it partly from traditions, partly from official documents, after the death of Simon, during the high-priesthood of Johannes Hyrcanus, and it was shortly afterwards translated into Greek, Syriac, and Latin. The second book contains—1. Two letters from the Palestinian to the Egyptian Jews, inviting them to celebrate the feast of the Reinauguration of the Temple (Chanukah), (i.—ii.); and 2. An extract, with introduction and epilogue, from the five Books of the Maccabees, by Jason of Cyrene. This second portion begins with the spoliation of the temple by Heliodorus, under Seleucus Philopator, and ends with the death of Nicanor; thus embracing the period 176—161 B.C. The two letters are spurious, and of a late date; and the extract from Jason's work—to a great extent, only an embellished repetition of the first Book of the M., of a partly moralising, partly legendary nature—contains many chronological and historical errors, and bears altogether the stamp of being written for merely religious and didactic purposes. The date both of the original and the extract are very uncertain, but the latter does not seem to have been made before the middle of the first c. B.C.

These two Books (*Sifre Chashmonaim*) are the only ones received in the Vulgate, and declared canonical by the councils of Florence and Trent, and translated by Luther. The third and fourth, however, appear to have been altogether unknown to the western church. The former of these treats of an ante-Maccabean incident: the miraculous salvation of the Jews in Egypt whom Ptolemaeus Philopator (221—204 B.C.) tried to force into idolatry. The style and general contents of this book point to an Alexandrine Hellenist as the author or compiler (about 200 B.C.); some investigators (Ewald, Grimm), however, are of opinion that the whole is a poetical invention, intended as a typical description of the circumstances of the Jews under Caligula. The fourth book, wrongly supposed to be identical with Josephus's *Supremacy of Reason*, contains, chiefly, the martyrdom of Eleazar and the seven brothers, and is probably also the work of an Alexandrine Jew living in Egypt—perhaps at the time of Herod the Great—and belonging to the Stoic school. Declarations, dialogues, monologues, and the like, are of frequent occurrence, and impart to the book the character of

a most artificial and strained composition. There is also a so-called fifth book of M. to be found in the Polyglot, but only the Arabic and Syriac versions, not the Greek original—the unique MS. of which is supposed to have perished—are extant. See APOCRYPHA, BIBLE.

MACCHIAVELLI, NICCOLO DI BERNARDO DI, born of an ancient but decayed family at Florence, in 1469, and a pupil of the celebrated scholar, Marcello Virgilio, was employed in public affairs from a very early age, and may be regarded as the literary representative of the political life of the important period to which he belongs. From a subordinate post in the office of the chancellor of Florence, which he held at that critical period of the republic which succeeded the expulsion of the Medici in 1493, he rose, in 1496, to the place of secretary of the 'Ten,' which, in the Florentine constitution of that day, may be regarded as the ministry of foreign affairs. M.'s duties were almost entirely diplomatic; he was employed in a great variety of missions, the instructions and correspondence connected with which may almost be said to contain the secret political history of Italy during his time. The culminating-point of M.'s reputation as a diplomatist was his mission to the great master of treachery and dissimulation, Caesar Borgia, Duke of Valentino, in 1502, of which an account is preserved in 52 letters written during the course of the negotiation, not surpassed in dramatic interest by any series of state-papers which has ever been produced. In the complicated external relations which Italy had now assumed, and which have remained with few changes to the present day, M. is found in communication with all the great foreign powers, as he had hitherto been with the Italian principalities. In 1507, he was sent to the Emperor Maximilian; and in 1510, he undertook a mission to France (the third time he had visited that country in a diplomatic capacity), which had a most important bearing on the relation of France with Italy, and the results of which will be best understood by comparing the league of Cambray with the subsequent alliance for the expulsion of the French out of Italy. On the restoration of the Medici in 1512, M. was involved in the downfall of his patron, the Gonfaloniere Soderini. He was arrested on a charge of conspiracy in 1512. On being put to the torture, he disclaimed all knowledge of the alleged conspiracy; but although pardoned, in virtue of the amnesty ordered by Leo X., he was obliged for several years to withdraw from public life, during which period he devoted himself to literature. It was not till the death of Lorenzo de' Medici, in 1519, that M. began to recover favour. He was commissioned in that year, by Leo X., to draw up his report on a reform of the state of Florence; and in 1521, and the following years, he resumed his old official occupation, being employed in various diplomatic services to several of the states of Italy. On his return to Florence in May 1527, he was taken ill, and having trusted to his own treatment of himself, the malady assumed a very formidable character, and in the end proved fatal, on June 22, 1527, just as M. had completed his 58th year. Some difference of opinion has existed as to his religious belief, and as to his sentiments during his last hours; but it seems certain that his death was marked by sentiments of religion, and accompanied by the ordinary ministrations of his church. His last years, however, were comparatively neglected. He was buried in the family vault in the church of Santa Croce; but it was only in 1787, and then through the munificence of a foreigner, the Earl Cowper, that a monument was raised to his memory.

M.'s writings are very numerous, filling 6 vols. 4to (Florence, 1783), or 10 vols. 8vo. Besides his letters and state-papers, which, as we have seen, are of the highest interest, his historical writings also comprise *Florentine Histories*, extending from 1215 to 1492, with a fragmentary continuation to 1499; *Discourses on the First Decade of Titus Livius*; a *Life of Castruccio Castracani* (unfinished); a *History of the Affairs of Lucca*. His literary works comprise comedies, an imitation of the *Golden Age* of Apuleius, an essay on the Italian language, and several minor compositions. He also wrote *Seven Books on the Art of War*, which has been much admired by the learned in military science. But the great source of his reputation, for good or for evil, is the celebrated book *De Principibus*, or, as it has since been called, *Del Principe*, some account of which is indispensable, in order to a just appreciation of the author. The main question discussed in this world-famed book is: 'How principalities may be governed and maintained?' In resolving this question, various cases are supposed, for each of which, appropriate rules, principles, and suggestions are laid down, and all are illustrated both by contemporary examples and by a wealth of historical learning which it is difficult to overrate. The 7th chapter, in which he details, and with evident admiration, the system of Caesar Borgia, and the 18th, in which he discusses 'the duty of princes as to the obligation of keeping faith,' are perhaps those which have most contributed to draw upon the author the odious reputation of which his very name has become the symbol; but, in truth, these chapters are only more precise and more formal than the rest, from their heaping together statements which are elsewhere innumered or supposed; the broad scheme of the book being everywhere the same, viz., that, for the establishment and maintenance of authority, all means may be resorted to; and that the worst and most treacherous acts of the ruler, however unlawful in themselves, are justified by the wickedness and treachery of the governed. Such being the moral of the book, a question has arisen as to the intention of the writer, and a favourite theory for a time prevailed, that *The Prince* was but a satire upon absolutism, and was designed to serve the cause of liberty, of which M. was an ardent friend, by making arbitrary power odious and contemptible. This theory, however, besides being utterly irreconcilable with the tone of the work, is completely disproved by a letter of M. to his friend Vettori, 1513, which was only discovered in 1810, and which shews that *The Prince* was written by M. in all seriousness, in order to recommend himself to the Medici (for whose private perusal it was designed, and not for publication) as a master in the art of government. In his ardour for the liberation of Italy from the rule of foreigners, M. had become convinced that strong native governments, even though absolute, must be endured; and, having accepted that of the Medici for Florence, he was content to use all means for its security and consolidation. *The Prince* was published, after M.'s death, at Rome, in 1532; and if any doubt should be entertained as to the seriousness of the author, it need only be compared with the commentary which is furnished by every page of his *Legazioni*, or the reports of his diplomatic missions, which are also contained in his collected works. Of the many criticisms and rejoinders to which *The Prince* has given occasion, the most remarkable is that of Frederick the Great, *Antimachiavelli, ou Examen du Prince de Machiavel*, 1740. It may be added that *The Prince* was condemned by Pope Clement VIII.

MA'CCLESFIELD, an important manufacturing town of Cheshire, England, is situated on the river Bollin, on the western base of a range of low hills, 15 miles south-south-east of Manchester. It contains a fine old church, St Michael's, founded in 1278; and a grammar-school, endowed in 1502, and having an annual revenue of £1500. Within the present century, M. has advanced rapidly as a seat of manufactures. Silks, embracing the finest varieties, are the principal fabrics made; cotton goods and small-ware are manufactured, and there are dye-works and breweries. In the vicinity, coal, slate, and stone are obtained. M. returns two members to the House of Commons. Pop. (1861) 36,101, shewing a decrease of 2937 since 1851.

MACCULLOCH, JOHN, a geologist and physician, born in Guernsey, of a Scottish family, 6th October 1773. He studied and took the degree of doctor of medicine in Edinburgh, and was appointed assistant-surgeon to an artillery regiment. In 1811, he was employed by the government in geographical and scientific researches in Scotland. In 1820, he was appointed physician to Prince Leopold of Saxe-Coburg, new king of the Belgians; and in the latter years of his life, was Professor of Chemistry and Geology in the East India Company's military school at Addiscombe. He died at Penzance, Cornwall, 21st August 1835, in consequence of an amputation rendered necessary by an accident. His most important works are a *Description of the Western Islands of Scotland* (3 vols. Lond. and Edinb. 1819); *A Geological Classification of Rocks, with Descriptive Synopses* (Lond. 1821); *A System of Geology, with a Theory of the Earth* (Lond. 1831); *Malaria—an Essay on the Production and Propagation of this Poison* (Lond. 1827); and *An Essay on the Remittent and Intermittent Diseases* (2 vols. Lond. 1828).

MACDONALD, ETIENNE JACQUES JOSEPH ALEXANDRE, Duke of Taranto, Marshal and Peer of France, was born 17th November 1765, at Sancerre, in the department of Cher. He was descended from a Scotch family which followed James II. to France. M. embraced the cause of the Revolution, entered the army as a lieutenant, and rapidly rose to high military rank. In 1793, he was intrusted with the government of the Roman States, but was compelled to evacuate them by the superior force of the enemy. In 1799, he defeated the Austrians at Modena, and was defeated on the Trebbia by a superior Austrian and Russian force under Suwarrow. As commandant of Versailles, he rendered very important service to Bonaparte in the revolution of 18th Brumaire; and in 1800 and 1801, he chased the Austrians from Switzerland and the Tyrol; but after honourably filling some important political posts, he lost the favour of Bonaparte by his honest support of the cause of Moreau. In 1809, he was summoned by the emperor to take the command of the right wing of the army of Italy under Eugène Beauharnais, and took Laibach. He greatly distinguished himself at the battle of Wagram, and on the field of battle became reconciled to Napoleon, who, for his services on that day, created him marshal and duke. He held a command in Spain in 1810, afterwards in the Russian campaign; in 1813, he defeated the Prussians at Muesburg, and contributed to the success of the battles of Lutzen and Bautzen, but was subsequently defeated by Blücher at the Katsbach. After the battle of Leipzig, he was employed in covering the retreat of the French army, and saved himself only by swimming the Elster. In the subsequent struggles on French ground, between the Marne and Seine, M. made desperate efforts;

but when he saw that further resistance was hopeless, he advised the emperor to abdicate. The Bourbons made him a peer, and gave him the command of a military division; and on Napoleon's return from Elba, it fell to his lot to oppose his progress to Paris. All his troops went over to Napoleon, but he himself accompanied Louis XVIII. in his flight; and although he returned to France, he refused to serve during the Hundred Days. After the second Restoration, he was continually loaded with honours of every kind, but consistently maintained, in the Chamber of Peers, the principles of constitutional liberty. He died at his seat of Courcelles, near Guise, 24th September 1840.

M'CLELLAN, GEORGE B., American general, was born at Philadelphia in December 1828. In his 16th year, he was sent to the United States Military Academy at West Point, where he graduated with high honours in 1846, and joined the army as second lieutenant of engineers, to take an active part in the Mexican war, where he distinguished himself under General Scott, in the battles of Contreras, Churubusco, Molino del Rey, and Chapultepec, and was promoted to a captaincy. At the end of the war, he was appointed to a professorship at West Point, and wrote a Manual on the Art of War. He built Fort Delaware, commenced a topographical survey for the Pacific Railway, and was one of three American officers sent to observe the campaign in the Crimea. On his return to America, he resigned his commission in the army, and became technical director of the Illinois Central Railway. At the commencement of the War of Secession, 1861, he was appointed major-general of the Ohio militia, but, by the advice of General Scott, he was tendered by President Lincoln the position of major-general of the army. After a successful campaign in Western Virginia, he was made commander-in-chief, and reorganised the army of the Potomac, defeated at Bull Run, July 21, 1861. In the summer of 1862, he invaded Virginia, by the peninsula of James River, and advanced near to Richmond, but was defeated in a series of battles in July, and compelled to retreat, and finally to evacuate the peninsula. After the defeat of General Pope, in the second battle of Bull Run, August 29, 1862, which was followed by a Confederate invasion of Maryland, he reorganised the army at Washington, marched rapidly north, met the forces of General Lee at Antietam, and, after a severe action, compelled him to recross the Potomac. He followed the Confederates into Virginia, but, moving with caution, and being opposed to the policy of the extreme war-party, he was superseded by General Burnside. Retiring to New York, he was honoured by the Democratic party, and is considered a prominent candidate for the presidency in 1864.

M'GULLOCH, JOHN RAMSAY, born at Isle of Whithorn, Wigtonshire, in 1789, a distinguished political writer, and the foremost of our living political economists, first became known in connection with the *Scotsman* newspaper and the *Edinburgh Review*. He became a contributor to the former, soon after its establishment in 1817; and for a considerable time was its editor. He made his *début* in the latter in 1818, by contributing to it an article on Ricardo's *Principles of Political Economy*, and continued for about twenty years to write pretty regularly for the *Review*, having contributed almost all the economical articles that appeared in it during that period, with a few on other subjects. M., however, is best known by his numerous works published during the last forty years, which are remarkable for the scientific spirit in which they are written, their practical good sense, and the clear-

ness and directness of their style. By these he has done more to establish and popularise the doctrines of political economy than any other living writer. His principal publications comprise: *A Discourse on the Rise, Progress, Peculiar Objects, and Importance of Political Economy*; *The Principles of Political Economy, with some Inquiries respecting their Application, &c.*; *The Literature of Political Economy, &c.*; *Treatises and Essays on Money, Exchange, Interest, the Letting of Land, Absenteeism, &c.*; *A Treatise on the Succession to Property vacant by Death, including Inquiries into the Influence of Primogeniture, Entails, &c.*; *A Treatise on the Circumstances which determine the Rate of Wages and the Condition of the Labouring Classes*; *A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation*; *Statistical Account of the British Empire*; *Geographical Dictionary*; *A Treatise on Taxation and the Funding System, &c.* Most of these works have gone through several editions. A third edition of the work on Taxation which has just (1863) appeared, is the latest work of the author, and is nearly re-written. M. has also published various occasional tracts and notices, some of which have had a very wide circulation. His edition of the *Wealth of Nations*, with an Introductory Discourse and Notes, and his Collected Edition of the Works of Ricardo, deserve to be ranked among the most important services which he has rendered to his favourite science. Latterly, he has edited two volumes of scarce economical tracts for the Political Economy Club, and four volumes of the same class of tracts for Lord Overstone. In 1828, M. was chosen Professor of Political Economy in University College, London; but having resigned that chair, he was subsequently (1838) appointed Comptroller of H.M. Stationary Office, a situation he now holds and in which he is understood to have effected various important reforms. M. is a Foreign Associate of the Institute of France; and he enjoys a pension of £200 a year, conferred upon him by the late Sir Robert Peel.

M'GULLOCH, HORATIO, a Scottish landscape-painter, was born in Glasgow in 1806, and named after Lord Nelson. His first intention was to fit himself for being a manufacturer, but finally he devoted himself entirely to art. He exhibited for the first time in 1829. In 1836, he was elected an Associate of the Scottish Academy, and next year he fixed his residence at Hamilton, and made enthusiastic studies of the oaks in Cadzow Forest. Two years afterwards, when he was elected a member of the Royal Scottish Academy, he removed to Edinburgh, where he has since lived. M. heads the roll of the living landscape-painters of Scotland. He paints the Highlands with unrivalled truth, breadth, and imagination. Among his principal pictures are 'Highland Loch,' 'Loch-an-Eilan,' 'View in Cadzow Forest,' 'Dream of the Forest,' 'Misty Corrie,' 'Deer Forest, Isle of Skye,' 'Loch Achray,' 'Mist Rising off the Mountains,' 'Kilchurn Castle, Loch Awe,' and 'Bothwell Castle, on the Clyde.'

MAOE, a strong short wooden staff, with a spiked metal ball for a head. It was a favourite weapon with knights, with the cavalry immediately succeeding them, and at all times with fighting priests, whom a canon of the church forbade to wield the sword. No armour could resist a well-delivered blow from the mace. The mace is now borne before magistrates as an ensign of authority.

MAOE, the Aril (q. v.) of the Nutmeg (q. v.) is the fruit, it is situated within the fleshy part and envelops the nut. It is a lacerated membrane, blood-red and somewhat fleshy when fresh. It is

MACEDONIA—MACGILLYCUDDY REEKS.

prepared for the market by drying for some days in the sun, and flattening. It has a peculiar, strong, agreeable smell and taste, and contains a clear, yellow, volatile oil, and a red, buttery, fixed oil. The volatile oil is obtained from it by distillation. The buttery oil, obtained by expression, mixed with the volatile oil and other substances, is known as *Nutmeg Balsam*. Mace is used as a spice, and has much of the flavour of the nutmeg, but with a slight difference, which to many tastes makes it more agreeable. It is of a bright orange-yellow colour, and has a peculiar wax-like texture. It is imported chiefly from Penang and Singapore, where it is received from the Spice Islands. Small quantities are sent also from the West Indies, where its cultivation receives some attention. About 120,000 lbs. are annually imported into Britain, of which 90,000 lbs. are re-exported.—The aril of species of *Myristica*, different from the true nutmeg, but coarse and very inferior, sometimes appears in commerce as mace.

MACEDONIA, anciently, the name of a country lying north of Thessaly. It was originally of small extent, embracing only the district called Emathia, but gradually extended until, in the time of Philip, father of Alexander, it reached, on the N., the Scardian Mountains, a portion of the Hæmus (mod. Balkan) range; on the W., the frontiers of Epirus and Illyria; on the E., the river Nestos (mod. Karasu); and on the S., Thessaly. The country is on the whole mountainous, especially in the south and west, but there are several large plains of great fertility. The principal rivers were called the Strymon, the Axios, and the Haliacmon. M. was famous among the ancients for its gold and silver mines, and its productiveness in oil and wine. It contained a number of flourishing cities, of which the names are well known in ancient history, particularly Pella, the capital, Pydna, Thessalonica, Potidæa, Olynthos, Philippi, and Amphipolis. The Macedonians are believed by some to have been originally an Illyrian race, but this is not probable. Their language, though different from, was yet allied to that of Greece. The singular fact, however, that it employed words not used by the Greeks, but preserved in Latin, would lead us to infer that the ethnological connection between Greece Proper and Macedon belonged to an extremely remote period. The Macedonians were certainly not pure *Hellenes*, nor did the ancients so consider them; but we may regard them as ruder members of the Grecian nation, whose early development had been hindered by unknown obstacles. The history of M. is involved in much obscurity till about 490 B.C., when the Persians subdued it, so that the Macedonian king, Alexander I. was compelled to take part with Xerxes in his invasion of Greece. On the retreat of the Persians after the battle of Plataea in 479 B.C., M. again recovered its independence. Under the wise and vigorous reign of Archelaus, who died 399 B.C., it greatly increased in prosperity and power; but after his death, a period of civil wars and contests for the throne ensued, which ended in the accession of Philip II. (359 B.C.), who not only seated himself firmly on the throne, but knew how to develop the resources of his kingdom, and so to direct the warlike spirit of his subjects as greatly to extend his dominions. His son, Alexander III., surnamed Alexander the Great (q.v.), brought half the then known world under his empire; but after his death, the Macedonian empire was broken up, and at the end of a period of twenty-two years of incessant wars, formed into four principal kingdoms under his greatest generals. M. itself fell to the lot of Antipater, after whose death ensued another period of civil wars and contests for the

throne, of which the Greeks endeavoured to take advantage for the recovery of their ancient independence. But the Athenians having called in the assistance of the Romans against Philip V. of M., by whom their city was besieged, the Macedonians were defeated by the Romans in the great battle of Cynocéphalæ (197 B.C.), and both Greece and M. became subject to the Roman power. Perseus, the successor of Philip, was finally defeated at Pydna (168 B.C.), and adorned the triumph of Æmilius Paulus. An attempt of the Macedonian nobles to shake off the oppressive yoke of the Romans having been also defeated, and the nobles driven into exile, M. became (148 B.C.) a Roman province, in which Thessaly and part of Illyria were included. After the time of Constantine, the country was ravaged by Slavic tribes; by the 7th c., the old semi-Greek Macedonians were extinct; and in the later ages of the Byzantine empire, their place was supplied by colonies from Asia, many of them of Turkish descent.—See Finlay's *Medieval Greece*.

MACEDONIANS, a party which arose towards the close of the Arian controversy, and took their name from Macedonius, who became Patriarch of Constantinople in 341. Their distinctive doctrine was the denial of the divinity of the Holy Ghost. In the early stage of the Arian question, the subject of the Holy Ghost attracted no special notice, being equivalently involved in the great subject of dispute regarding the Son. But when it came to be discussed, the same division of opinions was elicited regarding the Holy Ghost which had already arisen about the Second Person of the Trinity. Macedonius taught that the Holy Ghost was 'subordinate to the Father and to the Son, unlike to them in substance, and a creature.'—Socrates, *Ecclesiastical History* ii. 46. He had himself been a member of the semi-Arian party, and as such, had been deposed by the Arians in 360. His party was a considerable one, no fewer than 36 bishops having appeared attached to it at the council of Constantinople in 381. His doctrine, nevertheless, was condemned in that council, in which also was added to the Nicene Creed the special clause by which the divinity of the Holy Ghost is defined. The M. subsisted as a distinct party so late as the time of Theodosius.—They are also called *Pneumatomachi*, or 'Adversaries of the Spirit.'

MACERATA, a walled town of Central Italy, and capital of the province of the same name (formerly a delegation). Pop. 19,000. It is finely situated in the midst of hills, on a lofty eminence, 22 miles south-west of Ancona, and commands picturesque views of the sea and the Apennines. The streets are straight and well paved, and there are some fine public edifices, including a cathedral with some good paintings, six other minor churches, and numerous conventual establishments. The Palazzo Comunale, or town-hall, is a beautiful building of the 13th century. M. has a university of high repute, and is a centre of intellectual and social Italian life. The province contains a population of (1863) 239,411.

MACERS are officers attending the supreme courts in Scotland, appointed by the crown. Their duty is to keep silence in the court, and execute the orders of the courts, if addressed to them. They hold their office for life, and are paid by salary.

MACGILLYCUDDY REEKS, the highest mountains in Ireland, forming a group in the west of the county Kerry, and rising from the western shores of the Lakes of Killarney, to the beauty of which their lofty heath-covered summits add an element of grandeur. The Reeks cover an area of

about 28 square miles; and Carran-tual, the loftiest peak, is 3404 feet in height.

MACHICOLATIONS, the apertures between the corbels supporting a projecting parapet. The machicolations are for the purpose of allowing projectiles to be hurled at an enemy when he approaches near the wall, as in scaling, undermining, &c. Such defences are very common in castellated architecture, especially over gateways, towers, &c.

MACHINE AND MACHINERY. See **MECHANICAL POWERS.**

MACHINE-ENGRAVING has within the last few years been introduced for the purpose of superseding, in whole or in part, the manual operations of the engraver. The first step in this direction was the invention of the ruling-machine by Wilson Lowry for the purpose of engraving plain backgrounds, skies, or any other portions where the work was purely mechanical. The saving of labour effected by this instrument was very great, and as its work was performed in a most satisfactory manner, it soon came into very general use. But what is properly denominated machine-engraving is executed wholly by machinery. This department consequently excludes all artistic work, and is generally restricted to the engraving of patterns, bank-notes, &c. For the engraving of bank-notes, several machines have been invented, but their mechanism cannot here be described, as, besides being very complex, it is, for obvious reasons, kept secret as far as possible. The Americans have particularly distinguished themselves in this branch of engraving, and, in fact, it is to one of that nation, Mr Perkins, that the introduction of the bank-note engraving-machine is due. The latest and most perfect machine for engraving is that invented by Wagner of Berlin, and called by him the 'Universal Rose Engine, or Guilloche Machine,' which consists of a number of machines capable either of separate or of combined action, the number of distinct apparatus being co-extensive with the number of species of lines composing the pattern. The number and arrangement of the different apparatus can be so varied, that a practically unlimited number of patterns may be obtained, and the correctness and delicacy of these patterns is such as can hardly be surpassed.

MACHINERY, POLITICAL ECONOMY OF. It has never been questioned that machinery has added greatly to the productive power and the possessions of mankind, and has thus tended to place the poor more nearly on a par with the rich, by enabling them to obtain, at a cheap rate, articles of comfort and luxury of so good a quality as not to be capable of improvement by increase of expenditure. A mischievous fallacy has, however, often taken possession of the uninstructed, to the effect that machinery has a tendency to dispense with hand-labour, and so to benefit the consumer at the expense of the workmen. To clear away this fallacy, it is only necessary to remember, that machinery itself must be made with hands; that the capital of a country will not be diminished by the employment of machinery; and that such capital must continue to be employed in paying wages, as of old. It is true that there is a shifting of the parties to whom the wages are paid. When the power-loom was invented, much of the capital that went to hand-weaving was spent on iron and wood for the construction of power-looms. It is a speciality of machinery that it is apt to train the hands to do but one thing, and that thing is liable to fluctuations. The remedy for this is in the working-man not supposing, as he too often does,

that he has a right to be employed all his days in one special form of work, but in learning a variety of occupations, or rather learning the faculty possessed by intelligent people of turning the hand to a new function when that is necessary. It is of the more importance to keep this in view, that some kinds of manufacture accumulate in certain districts where they can be best executed, and in these there arises a sort of monopoly in the manufacture for the time being, but this monopoly is liable to be broken and affected by many accidents. Thus, the war with America has lately in this way powerfully affected the cotton manufacture, and driven a large body of people either to find another occupation, or to become paupers.

MACKENZIE, SIR GEORGE, an eminent Scottish lawyer and politician, son of Simon Mackenzie, brother of the Earl of Seaforth, was born at Dundee in 1636, studied Greek and philosophy at St Andrews and Aberdeen, and civil law at Bourges in France, then—as he himself calls it—'the Athens of Scottish lawyers.' In 1661, he acted as counsel for the Marquis of Argyre, then tried by a commission of parliament for high treason. About the same time, he was made a justice-depute, and among his other duties we find him, in 1661, appointed to repair 'once in the week at least to Musselburgh and Dalkeith, and to try and judge such persons as are ther or therabout delated of witchcraft.' He was soon after knighted, entered the Scottish parliament in 1669 as member for Ross-shire, and in 1677 was named king's advocate. Up to this point, his career had been marked by a decidedly patriotic spirit, and he was even one of the most popular men in the country. In the midst of his professional labours, he prosecuted literature with great assiduity. In 1663 appeared his *Requisitoir, or a Short Discourse upon several Divine and Moral Subjects*; in 1665, his *Moral Essay upon Solitude*; and in 1667, his *Moral Gallantry*. He also composed some poetry. His style is admirable for the time in which he lived; he was among the first Scotchmen who wrote the English language purely in M. cultivated the friendship of the great English writers of his day, and his own taste appears to have been excellent. Dryden, in his *Discourse of the Origin and Progress of Satire*, alludes to him as 'that noble wit of Scotland.' Unhappily, in the popular mind he is better known as criminal prosecutor in the memorable days of the Covenant, in which capacity he earned for himself the ugly name of the 'bluidy Mackenzie;' nor, we fear, can it be disproved—in spite of his liberal antecedents—that he became a willing instrument of despotism. He has, however, written a defence of himself, entitled *A Vindication of the Government of Charles II.* In 1678 appeared his *Discourse on the Laws and Customs of Scotland in Matters Criminal*; in 1684, his *Institutions of the Laws of Scotland*; and shortly after, he took the leading part in founding the Advocates' Library. He then retired to Oxford, and died in London, 2d May 1691.

MACKENZIE, HENRY, a British novelist, was born in Edinburgh in 1746, received his education at the university of his native city, and practised as an advocate there. In 1804, he was appointed comptroller of taxes for Scotland. He died 14th January 1831, at the advanced age of 86. His *Man of Feeling* (1771), *Man of the World* (1783), and *John Roubigne*, won him rather a high place among the authors of his time. There is in all of these works something of the minuteness of Richardson, with a peculiar soft and sentimental tone, partly derived from Sterne, but without much evidence of his genius. In 1778, M. began to edit a periodical called

the *Mirror* (modelled after the *Spectator*), which lasted for 17 months, and was followed by the *Lounger* in 1785, which lasted for two years. His contributions to these display a greater manliness of style than his fictions, and a considerable measure of wit and humour. He had the credit of being the first to direct public attention, by an article in the *Lounger*, to the merits of the poems of Burns. He afterwards entered into the controversy concerning the poems of Ossian, the authenticity of which he denied, and also wrote political pamphlets in support of Pitt's administration.

MACKENZIE RIVER, an important river of British North America, discovered and first navigated by Alexander Mackenzie—from whom it derives its name—in 1789, has its origin under the name of *Athabasca River* (q. v.), in Mount Brown, and after a north-north-east course of 687 miles falls into Lake Athabasca. Emerging from this lake as the *Slave River*, it receives the *Peace River* (q. v.), and after another course of 210 miles falls into Great Slave Lake (q. v.). It now assumes the name of M. R., and conveys the waters of the Great Slave Lake to the Arctic Ocean at Mackenzie Bay, after a final course of 876 miles, making a total of 1773 miles. In many places it is more than a mile in width, and it is navigable for steam-boats throughout the greater part of its course from Great Slave Lake. There is only one obstruction, and that not a material one, occurring near Fort Hope, in lat. about 66° N. Its chief affluent is the Liard, which rises on the west side of the Rocky Mountains, and after a course of 380 miles, forces its way through a pass, and after flowing first east and then north, joins the M. R. after a total course of 690 miles. The mouth of the river is closed from October to June by ice. See *ATHABASCA* and *GREAT SLAVE LAKE* and *RIVER*.

MACKEREL (*Scomber*), a genus of fishes of the family *Scomberidae* (q. v.); having a spindle-shaped body; the tail becoming very slender, and slightly ridged or keeled on each side. Some of the species have, and some have not, air-bladders.—One species, the *COMMON M. (S. scomber)*, is plentiful on the coasts of Britain, and of Europe, from the Mediterranean to the furthest north, also on those of Greenland, and on the American side of the North Atlantic Ocean. It is a very beautiful fish, of brilliant green and blue, the males having nearly straight dark transverse bands, the females having the bands elegantly undulated. The tail is crescent-shaped. The M. is said sometimes to attain a length of 20 inches, but is usually about 14 or 16 inches long, and about 2 lbs. in weight. It is highly esteemed for the table, and the M. fisheries of the south of England and of the southern parts of Europe are very important. M. is readily caught by bait, and particularly by any kind of bait moving swiftly through the water—a long slice cut from one of its own kind, or even a slip of red leather, or a piece of scarlet cloth. Boats engaged in M. fishing are therefore often under sail, and a smart or 'mackerel' breeze is preferred. But the greatest quantities of M. are taken by nets; seine-nets wrought by two boats, and enclosing shoals of fish, or drift-nets—20 feet deep by 120 feet long—well corked at the top, and without lead at the bottom. M., after being taken, must be sent very quickly to market, as they very soon cease to be quite fresh. Fast-sailing boats are employed for this purpose, which purchase from the fishing-boats, and often employ the aid of steam. In France and some other parts of Europe, M. are often salted.—It was formerly supposed that great migrations of M. took place; but it is now believed, as in regard to

herring, that they merely leave the deep water and approach the coast for the purpose of spawning. The time when they appear varies in different latitudes: in the south of England, the M. season is in the end of spring and beginning of summer; in Orkney, it is in the end of summer.—Another species, the *SPANISH M. (S. colias)*, which attains the weight of 4 or 5 lbs., and is more obscurely banded, is sometimes caught on the southern coasts of Britain, but is little esteemed. It has an air-bladder, which the common M. has not.—The *SCAD* (q. v.) is sometimes called *HORSE-MACKEREL*.—The *MACKEREL-MIDGE*, a very small fish, is a species of Rockling (q. v.), of the family *Gadidae*.

MA'OKINAW, or **MICHELIMA'OKINAC**, a village, on an island of the same name, in the north-west part of Lake Huron, belonging to Michigan, United States of America, 320 miles west-north-west of Detroit, is an old French trading-post, now a fashionable summer resort. Fort Mackinaw, on a bluff 150 feet high, commands the village and harbour. It has extensive fisheries, and is a stopping-place for steamers plying between the lower and upper lakes. Pop. about 2000.

MACKINTOSH, Sir JAMES, a philosopher and politician, was the son of Captain John Mackintosh of Kellachie, in Inverness-shire, and was born at Aldourie in that county, October 24, 1765. He studied at King's College, Aberdeen, where his most intimate companion was Robert Hall, afterwards the celebrated Baptist preacher. From King's College he proceeded to Edinburgh in 1784, for the purpose of studying medicine; and after obtaining his diploma, settled in London, and for some time supported himself by writing for the newspapers. The first work that brought him into notice was his *Vindicia Gallias* (1791), in reply to Burke's *Reflections on the French Revolution*. In sober philosophic thought, sound feeling, and common sense, it greatly surpassed the splendid philippic against which it was directed, and was enthusiastically lauded by the Liberal party; Burke himself thought highly of it. Fox, Sheridan, and other leading Whigs sought the author's acquaintance; and when the 'Association of the Friends of the People' was formed, he was appointed secretary. About this time, he began to turn his attention to the legal profession, and was called to the bar in 1795, and attained high eminence as a forensic lawyer. In 1799, he delivered a course of lectures on the Law of Nature and of Nations, before the benchers of Lincoln's Inn, which were attended by audiences of the most brilliant description. His defence of Peltier (February 21, 1803), charged with a libel on Bonaparte, was superb. It was translated into French by Madame de Stael, and scattered broadcast over Europe. In 1804, he was appointed recorder of Bombay, for which place he sailed in the beginning of the year, arrived there in May, was appointed judge of the Admiralty Court in 1806, and remained till 1811. His Indian career was highly creditable to his capacity and honourable to his character. After his return to England, he entered parliament as Whig member for Nairn (1813), accepted the professorship of law in the college of Haileybury in 1818, and in 1830 became a member of the Board of Control under the Grey ministry, and spoke in favour of the Reform Bill. This was his last great political effort. He died not long after, on the 22d of May 1832. Every one now will regret that Sir James M. ever turned aside to a political life. He was essentially a literary moralist and philosopher, and might have won a far higher and more enduring reputation than he has, if he had resolutely prosecuted the calling for which nature

intended him. His *Dissertation on the Progress of Ethical Philosophy*, written for the *Encyclopædia Briannica*, although very incomplete, and lacking that precision and profundity that can only be acquired by rigorous and extensive research, shews the admirable powers of the author, his breadth of view, tolerance, impartiality, love of truth and virtue, and his gift of calm and measured eloquence. For Lardner's *Cyclopædia*, he wrote a brief but excellent survey of the History of England. An historical fragment (intended to form portion of a large work) entitled *History of the Revolution in England* in 1688, appeared after his death, and was pronounced by Macaulay to be the best history of the reign of James II. A collection of his miscellaneous works, including his contributions to the *Edinburgh Review*, was published at London, in 3 vols. See *Memoirs* of his life by his son, 2 vols. (Lond. 1835).

MACKNIGHT, Dr JAMES, an eminent divine of the Church of Scotland, was born at Irvine, in Ayrshire, 17th September 1721; studied at Glasgow University, and afterwards at Leyden, in Holland; and in 1753 was ordained minister of the parish of Maybole. In 1769, he was translated to Jedburgh, and thence to Edinburgh in 1772, where he died, 13th January 1800. M. was a superior scholar, a liberal, wise, and prudent ecclesiastic, and one of the most respectable writers that the Church of Scotland has produced. His principal works are—*Harmony of the Four Gospels* (1756); *The Truth of the Gospel History* (1763); and *A New Translation of the Apostolical Epistles, with Commentary and Notes* (1795).

MACLAURIN, COLIN, an eminent mathematician, was born, in 1698, at Kilmodan, in Argyshire, Scotland. He was educated at Glasgow University, where he took the degree of M.A. in 1713; and after four years of close study obtained, in 1717, after a severe competitive trial, the professorship of Mathematics in Marischal College, Aberdeen. In 1719, he visited London, and was received as member of the Royal Society, at the same time making the acquaintance of many eminent men, Newton among the rest. Here he published his *Geometria Organica* (1720), an elaborate treatise on the 'description' of curves. He afterwards visited France in the capacity of tutor to a son of Lord Polwarth, and while there, wrote a dissertation on the *impact of bodies*, which gained the prize of the Academy of Sciences in 1724. The following year, he was appointed assistant to James Gregory, Professor of Mathematics in the university of Edinburgh, and soon after succeeded him in the chair. He died in 1746. His writings, distinguished for their originality, profundity, clearness, and elegance of style, gave a strong impetus to the study of mathematical science in Scotland. His works, besides those above mentioned, are—*A Treatise of Fluxions* (Edinburgh, 1742), a work written in defence of Newton's discoveries, against the attack of Berkeley, and the first in which the principles of fluxions were logically arranged; *A Treatise on Algebra* (1748), left incomplete by the author; *An Account of Sir Isaac Newton's Philosophical Discoveries* (Lond. 1748), also incomplete and posthumous, which contains explanations of all Newton's discoveries, the optical ones excepted; and a number of papers which were published in the *Edinburgh Philosophical Transactions*. His most important scientific investigations related to the 'form of the earth,' the 'tides,' and the action of the wind on the sails of ships and wind-mills. His memoir on the tides was, in 1740, presented in competition for the prize offered by the Academy of Sciences; but three other competitors, Euler, Daniel

Bernouilli, and Father Cavalleri, having appeared, the Academy, after consideration, shared the prize among them.

MACLE, a term employed in mineralogy to designate what are also called *twin crystals*, which are crystals united according to some precise law, yet not having their faces and axes parallel, so as to render the one a mere continuation of the other. In some macles, the axes are parallel; in some, they are inclined at an angle. Crystallisation in macles is very characteristic of some minerals.

MACLE is also the name of a mineral, also called **CHIASTOLITE**, a silicate of alumina, containing a little magnesia and oxide of iron. It occurs in crystals, of a dirty or pale gray colour, or yellow or red, imbedded in clay-slate, in Cumberland, Wiclow, Brittany, the Pyrenees, &c. The crystals are rhombic prisms, remarkable for presenting, in the section perpendicular to the axis, a dark cross on a light ground. Although it is of very dull lustre, M. has therefore been much used for making beads for rosaries, &c. Polished slabs present a curious appearance, like Hebrew writing. M. is the armorial bearing of the great French House of Rohan.

MACLISE, DANIEL, R.A., an eminent painter of Scotch extraction, was born at Cork, in Ireland, January 25, 1811; entered the Royal Academy, London, in 1828, and acquired a high reputation as a student. In 1833, he exhibited his first picture at the British Institution, 'Mokanna unveiling his Features to Zelica'; and in the same year, 'All-Hallow Eve,' and 'A Love Adventure of Francis I. with Diana of Poitiers,' at the Royal Academy. Since then, among his principal works may be mentioned—'Chivalrous Vow of the Ladies and the Peacock' (1835); 'Robin Hood and Richard (Grand-Lion)' and 'Merry Christmas in the Baron's Hall' (1838); 'The Banquet Scene in Macbeth,' and 'Scene from Twelfth Night' (1840); 'The Sleeping Beauty,' and 'Hunt the Slipper at Neighbour Flam-borough's' (1841); 'Play Scene in Hamlet' (1842). 'Sabrina releases the Lady from the Enchanted Chair' (1844); 'Ordeal by Touch' (1846); 'Chivalry of the Reign of Henry VIII.,' and his design of 'Shakespeare's Seven Ages' (1848); 'The Green Spectacles' (1850); 'Caxton's Printing-office' (1851); and 'The Marriage of Strongbow with the Princess Eva' (1854). For some years, he has been engaged on a series of cartoons, to be painted in fresco in the Royal Gallery of the Houses of Parliament, illustrative of the glories of England in war. M. is regarded as a thoroughly original artist. His imagination is extremely rich, his power of composition great, and his colouring fine.

MÂCON (ancient, *Matisco*), a town of France, capital of the department of Saône-et-Loire, on the right bank of the Saône, over which there is a bridge of 13 arches, 38 miles north of Lyon. On the river-side are ranges of handsome quays, with two commodious harbours, and a line of fine houses. In general, however, the streets are crooked, narrow, and dirty. It contains several noteworthy churches, and the ruins of a cathedral, almost wholly destroyed during the first Revolution. M. carries on an extensive trade in the excellent wine grown in the vicinity (known as Maçon), as well as in corn, cattle, &c.; leather, blankets, earthenware, clocks, and watches are manufactured. Pop. 16,500. M. has some Roman antiquities, among which are remains of a triumphal arch and of a temple of Janus.

MACON, a city of Georgia, United States of America, at the head of the navigation, and on both sides of the river Ocmulgee, 190 miles west-north-west

from Savannah, on the Central Georgia Railway. It has many elegant public buildings, among which are a court-house, market, nine churches, seven banks, academy, blind asylum, Wesleyan female college, &c. M. has six newspapers, and carries on a large business. Pop. (1860) 8247.

MACPHERSON, JAMES, a person who has obtained a remarkable notoriety in literature, was born in 1738, at Ruthven, in Inverness-shire. After finishing his studies at King's College, Aberdeen, he became a schoolmaster in his native village, published a poem entitled *The Highlander* in 1758, contributed about the same time verses to the *Scots Magazine*, and in the following year, having met with the Rev. Dr Alexander Carlyle, minister of Inverack, and John Home, the author of *Douglas*, he shewed them some fragments of Gaelic verse, of which he also gave them 'translations.' These 'translations' (16 in number) appeared in 1760, and were so much relished, that the Faculty of Advocates in Edinburgh raised a subscription to enable M. to make a tour through the Highlands for the purpose of collecting more of the same. M. was very zealous and successful in the 'discovery' of literary treasures. Where he made his discoveries, however, no man knows. He found ancient MSS. in regions where no one before had suspected their existence, and where no one since has been fortunate enough to obtain them. The result was the appearance at London, in 1762, of the so-called 'Poems of Ossian,' under the title of *Fingal, an Epic Poem, in Six Books*; and in 1763, of *Temora, an Epic Poem, in Eight Books*. A storm of controversy soon arose in regard to their genuineness, which has hardly yet subsided, but on the whole, we may safely say the verdict is unfavourable to Macpherson. See OSSIAN, POEMS OF. These poems were, however, the making of him in a worldly point of view. He was appointed surveyor-general of the Floridas (in 1764) with a salary for life, and agent to the Nabob of Arcot—a very lucrative office—in 1779; entered parliament in the following year as member for Camelford, sat for ten years, and then retired to an estate which he had purchased in Inverness-shire, where he died February 17, 1796. His body was brought back to England, and was actually interred (at his own request and expense) in Westminster Abbey. M. wrote in the latter half of his life a variety of historical compilations, pamphlets, &c., and translated Homer's *Iliad* into prose.

MACQUARIE, a river of East Australia, rises about 80 miles west of Sydney, in the county of Westmoreland, and has a north-west course of 280 miles. Its waters are lost in marshes, whence issue tributaries of the Darling, of which river the M. may be said to be one of the head waters.

MACQUER, PIERRE JOSEPH, born at Paris in 1718, of a family originally Scotch, has acquired a reputation as a chemist and physician. He died 15th February 1784. M.'s principal works are *Eléments de Chimie théorique* (Par. 1741); *Eléments de Chimie pratique* (Par. 1751); and a *Dictionnaire de Chimie* (Par. 1776). See GASES.

MACREADY, WILLIAM CHARLES, an English tragedian, whose father was the manager of a provincial company, was born in London, 3d March 1793, educated at Rugby, and made his first appearance as Romeo at Birmingham in 1809. For four years he was connected with his father's company, and for two years thereafter he sustained leading parts in the provinces. In September 1816, he made his first appearance before a London audience, and gained the applause of Kean, who was one of his auditors. His progress in the higher walks of the drama was slow, principally, it is

understood, from professional jealousies. In 1819, he made a hit in the character of Richard III., and he afterwards adventured on other of Shakespeare's characters with success. In 1826, he made a tour in the United States, and he visited Paris in 1828. He became lessee of Covent Garden Theatre in 1837, and relinquished it two years thereafter. He afterwards undertook the management of Drury Lane, but gave it up after encountering considerable pecuniary loss. In 1849, he visited America for a second time, and barely escaped with his life from a riot which took place in the theatre at New York, caused by the jealousy of Mr Forrest, an American actor. On his return home, he was engaged at the Haymarket, and his theatrical career was brought to a conclusion on February 3, 1851. He took his benefit at Drury Lane on the 26th of the same month. Shortly afterwards, the Macready Banquet was celebrated, attended by a host of friends distinguished in literature and art, and at which a sonnet, composed by Mr Tennyson—taking a grateful farewell of the great actor—was read.

M. was a fine and impressive actor, but he was more indebted for his success to art than to nature. He succeeded best in the graver characters of the drama. He inherited more of the staltiness of Kemble than the fire of Kean.

M'CRIE, DR THOMAS, a Scottish divine and historian, was born at Dunse, in Berwickshire, November 1772, studied at the university of Edinburgh, and was ordained, in 1795, pastor of an Anti-Burgher congregation in that city. Here he died, 5th August 1835. M.'s works are in the highest degree valuable to the student of Scottish ecclesiastical history. They exhibit a vast amount of minute yet important research, and though they are essentially apologetic, the author is never consciously unfair, and does not misstate facts. He has, however, a way of palliating even the indefensible acts of the Reformers, and a zeal for Presbyterianism, that caused the impartial Hallam to describe his spirit as *Presbyterian Hildebrandism*. M.'s best known works are *The Life of John Knox* (Edin. 1812), and *The Life of Andrew Melville* (1819).

MACROBIUS, AMBROSIIUS AURELIUS THEODOSIUS, a Latin grammarian of the 5th century. He appears to have been by birth a Greek, but literally nothing whatever is known of his life. Two of his works remain, entitled *Commentarius ex Cicerone in Somnium Scipionis*, and *Saturnaliorum Conviviorum Libri Septem*. The former is the best known, and was much read during the middle ages; the latter is in the form of a dialogue, and contains many valuable historical, mythological, antiquarian, and critical observations. Of a third work, *De Differentiis et Societatibus Græci Latineque Verbi*, we possess only extracts made by one Joannes—thought by Pithou to be Joannes Scotus—in the 9th century. It has been warmly discussed—as if it were of consequence to mankind—whether M. was a Christian or a pagan. The evidence for his being the former is, that he speaks of God as *omnium fabricator* (the maker of all things), which must be reckoned as extremely slender; and of the latter, his great admiration for the piety and wisdom of one Prætextatus, a heathen priest, and his reverence for Greek divinities. The *editio princeps* of M. appeared at Venice in 1472; of later editions, the best is that of Gronovius (Leyden, 1670), reprinted by Zeunius at Leipzig in 1774.

MACTRA, a genus of lamellibranchiate mollusca, having a somewhat triangular shell, broader than long, the valves equal; the animal with the siphons united to the extremity, and a large compressed

foot. They are sometimes called Trough Shells. The species are numerous, and widely distributed; they burrow in the sand and mud of sea-shores, and of the bottom of the sea. The foot enables them also to move with activity, after the manner of

Macra Stultorum.

cockles. Some of the species have shells of considerable beauty, others are coarse. Several small species are very abundant on the British shores, so that in some places they are gathered for feeding pigs, but not by those who have much regard to the quality of the bacon. The fossil species are few. The genus *M.* is the type of a family, *Macridæ*.

MACULÆ is the term given by Willan and Bateman, and some other dermatologists, to one of the orders of skin-diseases. The affections included in the term maculæ can, however, hardly be regarded as diseases; they are merely discolorations of the skin, resulting from some change in the production of the colouring matter. The following varieties are recognised.

1. *Lentigo*.—This term is applied to those small yellowish or brownish-yellow irregularly rounded spots which are denominated freckles, and which are most abundant on the parts chiefly exposed to the light, as the face, hands, &c. In some cases, these spots are congenital, while in other cases they seem to be produced by exposure to the sun's rays; and in both cases they chiefly occur to persons of fair complexion with light sandy hair. When patches of a larger size than that of ordinary freckles are produced by exposure to the sun, the affection receives the name of *Ephelis*. Congenital spots cannot be removed by any applications; but those which depend on exposure may be treated with soothing lotions or liniments, as an emulsion of sweet almonds, or a mixture of lime-water with almond oil.

2. *Pigmentary Nevus*.—This is a congenital dark discoloration of the skin, with little or no elevation of the surface, and often covered with hair. It usually occurs in small spots, but sometimes appears in large patches. It is perfectly harmless, and should not be interfered with.

3. *Albinism* or *Leucopathy*.—This affection has been already noticed in the article *ALBINO*. When congenital, it may be considered irremediable, but cases of partial albinism, occurring after birth, may sometimes be relieved by local stimulants.

MADAGASCAR, an island situated to the south-east of the African continent, and extending over an area larger than the British Isles, and containing a population of upwards of five millions. It is in lat. 11° 57'—25° 38' S., and long. about 43°—51°; length, 1030 miles; greatest breadth, 350 miles; area estimated at 225,000 square miles. The early history of this interesting island is involved in the deepest mystery. It is supposed to have been known to the ancients, by whom it was generally considered as an appendage to the mainland, and the Phœnicians are probably the navigators to

whom its discovery is due. In the year 1774, the Baron Beauséjour, a Pole by birth, formed a French settlement at Antongil Bay, on the eastern side of the island. This establishment, partly owing to the hostility of the natives, and to the supineness of the French government at home, gradually fell into decay, and was ultimately abandoned. The native consist of many tribes, of which the Hovas inhabit the centre and northern portion of the island, and are at present so powerful as to hold in subjection most of the others. The features of this section of the inhabitants present a striking resemblance to those of the South Sea Islanders. They are evidently of different extraction to the other and darker tribes, whose features are wholly African. The men are generally well made, having finely proportioned limbs, and usually present a high type of physiological development. The women are well formed and active, but by no means so prepossessing in feature as the other sex. The complexion of the Hovas is a ruddy brown or tawny colour, while that of the other tribes is much darker. Another and very peculiar distinction is the long, straight hair of the former as compared to the wavy growth of their neighbours. The principal article of dress in use among the Hovas is the *kamba*, a garment very similar to the Roman toga, and made of cotton or linen materials.

In the year 1816, diplomatic and commercial relations were entered into between the British government and Radama, king of the Hovas, who had gradually extended his influence over the greater part of Madagascar. In consideration of his promise of assistance to suppress the slave-trade carried on in the Mozambique, British drill-sergeants were sent to him to discipline the native troops. Missionaries had previously established themselves, and by their aid a few English mechanics found the means of introducing useful arts among the inhabitants. With the ostensible object of carrying out his agreement, Radama was furnished with firearms for his troops, which he quickly, however, made use of in the reduction of such tribes as yet remained in opposition to his supremacy. Upon the death of Radama, he was succeeded by Ranaivola Manjaka, a woman, whose reign was marked by every cruelty possible to be practised against the native Christians. She closed the missionary schools, banished the religious instructors, and drove the suffering converts to the shelter of the fastnesses of the country, where they were either hunted down and put to death, or lingered in misery, to bewail their lost relatives and companions. One of the acts of the new queen was to issue an order which banished Europeans from the island, which had the effect of stopping the trade between her dominions and the neighbouring British colony of Mauritius. In consequence of the outrages upon British subjects to which this order gave rise, Sir William Gomm sent H.M.S. *Conway* to Tamatave (1845), the usual trading-port on the eastern coast, with instructions to co-operate with the French from Bourbon in the endeavour to secure a satisfactory issue of the dispute. Failing in this, resort was had to arms. A detachment of French and English men landed from the ships under cover of their guns, and proceeded to attack the fort. Finding the work, however, of far greater strength than had been supposed possible, the allies were compelled to retire without having fully accomplished their purpose. The loss in this affair was disastrous, it consisted of 21 killed and 54 wounded, many of both English and French. On receipt of the news of this engagement in France, an expedition was planned to chastise the Malagasy for the outrage,

but the complications then existing in the situation of the French cabinet prevented its accomplishment. In 1862, Queen Ranavalala Manjaka died, and her son was proclaimed king under the title of Radama II. This prince, of a weak and vacillating character, at first gave promise of encouragement to the unfortunate native Christians; but his subsequent acts were marked by a favouritism and general maladministration, which, in 1863, procured his destruction, together with his ministry. A conspiracy being formed with the object of overthrowing the government of the king, he was strangled in his palace, his queen being prevailed on to accept the supreme authority, and the government being modified into a constitutional form.

M. presents some remarkable features of interest in its natural aspect. It is traversed throughout its entire length by a mountain-range, rising in several of its summits to 10,000 or 12,000 feet in height, and sending off branches toward the shores, which, however, are generally low. From this range numerous rivers flow to the eastern and western shores. Of these many are admirably adapted for commerce, and one, the Betaibuka, is about 400 miles in length. The north-western coast is indented with bays well sheltered from the prevailing winds, and affording secure anchorage for shipping. The country is covered with luxuriant verdure, and the climate is agreeable for at least six months during the year; the prevalence of low fever, however, renders it very undesirable as a residence for Europeans. Throughout the island, an abundant supply of timber would be obtainable, did roads exist by which to convey it to the coast. The exports of M. are horned cattle and a small quantity of rice, shipped principally to Mauritius and Bourbon. The island is rich in iron, but the present means of working it are very deficient; indeed, so abundant is the supply, that the natives seldom take the trouble to excavate beyond a few feet. The Malagash are excellent smiths, and their forges, though rude, are capable of producing most of the implements employed by them in husbandry, and such mechanical arts as are practised. At present, the only mode of travelling is in palanquins, borne on the shoulders of men; and the paths by which this simple method of journeying is performed are often so bad as to cause much delay. The country being covered, for the most part, with forest, the making of roads would be a work of many years; and the natives know too well the importance of keeping the interior of their beautiful island inaccessible to the advance of an enemy, to hazard the attempt. The capital and seat of government is Antananarivo (the 'City of a Thousand Towns') (q. v.). It was visited in 1862 by an embassy from the British at the Mauritius, and there are now consuls established there. Both the flora and the fauna of M. are peculiar, and comprise many species, and even many genera nowhere else to be found. Even of the quadrupeds, many are peculiar; and in this department of zoology, the number and variety of the *Lemuridae* is a prominent characteristic. Orchidaceous plants and ferns are very numerous and beautiful; and among the botanical curiosities of M. are the Traveller's Tree (*Urania speciosa*), and the beautiful Lattice-leaf plant (*Ouvirandra fenestralis*).

MADDALONI, a city of Italy, in the Neapolitan province of Terra di Lavoro, 14 miles north-east of Naples. Pop. 17,160. It stands in a finely irrigated and fertile district, and enjoys a most salubrious climate. It is an industrious and thriving place, with several fine palaces and churches. It is now connected by railway with Naples and Gaeta.

MADDER (*Rubia*), a genus of plants of the natural order *Rubiaceae*, very nearly allied to the genus *Galium* or Bedstraw (q. v.), and differing from it chiefly in having a juicy fruit resembling two small berries growing together. The species are found in the tropical and warmer temperate parts, both of the Old and New Worlds, and are important for the colouring matter of their roots. The most important is the COMMON M. or DYER'S M. (*R. tinctorum*), a native probably of the south of Europe as well as of Asia; and now very extensively cultivated in most European countries, and also in the East Indies, China, &c. It is a perennial, with weak stems and whorls of 4-6 elliptic or lanceolate glossy leaves, the stem and leaves rough with sharp prickles; small greenish yellow flowers, and black fruit.—Munjeet (q. v.), or INDIAN M. (*R. munjista* or *cordifolia*), ranks next to it in importance.—The roots of *R. peregrina* and *R. lucida* are also used in some parts of the Levant. *R. peregrina* is found in the south-west of England, and is called WILD MADDER. It is very similar to *R. tinctorum*. The roots of *R. reibun* and *R. Chilensis* are used in Chili and Peru.

There is no material of greater importance to dyers than M. (*R. tinctorum*), not only from the great beauty of the colours obtainable from it, but also from the ease with which it can be worked, and the great variety of its applications. Although the M. plant thrives best in warm climates, it may be, and is successfully cultivated in northern districts. The Dutch province of Zealand has long been celebrated for the large crops of M. produced there; and until about 30 years since, our dyers rarely used any other than Dutch M., which was always sent ground and packed in large casks; but with the improvements in dyeing, it was discovered that the roots grown in warmer localities possessed not only much superior qualities, but could be made to produce other and more beautiful shades of colour. Besides a genial temperature, M. requires a rich, deep soil and careful cultivation. It is usually propagated by cuttings or by shoots from the stocks of old plants; these are set about a foot apart, and in rows, three feet from each other; the planting takes place in spring; and sometimes the roots are lifted at the usual harvest-time for madder (October or November). In France and Germany, the markets are supplied with one year old (called by the Germans *rotthe*), eighteen months old, and three years old, which is the best, and called by the Germans *trapp*, or M. *par excellence*. The roots are carefully raised with forks, to prevent breaking them as much as possible; and after the soil is thoroughly shaken off, they are dried in stoves, and afterwards thrashed with a flail, to remove the loose skins and any remaining soil still adhering; they are then cut, or broken in pieces, and packed for sale, or they are sent to the mills to be ground. In Turkey and Italy, where the solar heat is great, the stove is dispensed with, the roots being dried in the sun. The more the roots are freed from the epidermis, the better the quality of the M.; hence, before it is ground in France, many manufacturers employ mechanical means, chiefly sieves worked by machinery, which rub off and separate the soft, dark-brown skin which covers the roots—this process is called *robage*. One year-old roots cannot be profitably dressed in this way, and are therefore ground with the epidermis. Much of the inferior Dutch M. is also ground without dressing, and such is called *mull* in trade. The grinding is effected in mills with vertical stones, and the meal is passed through sieves of different degrees of fineness, which gives rise to various qualities in the market. These qualities are

numerous, and have special marks to distinguish them, well known to merchants, but are of no general interest. The *M.* from Turkey and from India never comes to us ground, the roots are merely broken up into pieces an inch or two in length, and packed in bales. Very small quantities of *M.* occasionally reach us from Russia; it is the produce of the government of Baku, on the Caspian Sea, and is said by our dyers to be the finest in the world.

As might be expected of a substance of such vast commercial and manufacturing value, *M.* has undergone the most elaborate chemical researches. Its dyeing quality has been known for at least two thousand years, and its medicinal qualities are also mentioned by Pliny and Dioscorides. The former writer, referring to its value as a dyeing material, says: 'It is a plant little known except to the sordid and avaricious, and this because of the large profits obtained from it, owing to its employment in dyeing wool and leather.' He further says: 'The madder of Italy is the most esteemed, and especially that grown in the neighbourhood of Rome, where, and in the other provinces, it is produced in great abundance.' The *M.* of Ravenna was, according to Dioscorides, the most esteemed. Its cultivation in Italy has never been discontinued; and under the present enlightened government, it has received such an impetus that the exports of the Neapolitan provinces alone, last year, exceeded in value a quarter of a million sterling. It was about the beginning of the present century that the colouring matter of *M.* began to attract very especial attention. It had long before been noticed that cattle which used the green parts of the plant as fodder had a red colour communicated to their bones, which was only removed by discontinuing this kind of food for a considerable time. This shewed the colouring matter to be capable of isolation; dyers also began to suspect that the colour produced was a combination of two—one red, and the other a tawny brown. But Roubiquet, a French chemist, about 1820, demonstrated that *M.* contains two distinct colours, capable of being isolated and used separately; he called them Alizarine and Purpurine—the former, he asserted, gave the bright red, and the latter the purple red colours. Practically, Roubiquet's statement may be held to be correct; but the recent and more elaborate researches of Dr Schunck, of Manchester, have shewn the composition of *M.* to be very complicated indeed. At the meeting of the British Association in 1861, he shewed the following chemical principles, all obtained from this remarkable root: 1. Rubianine; 2. Rubianic Acid; 3. Rubianite of Pottah; 4. Purpurine; 5. Chlorrubian; 6. Pthalic Acid; 7. Alizarine; 8. Rubiadine; 9. Chlorrubiadine; 10. Rubiafine; 11. Rubiacine; 12. Rubian; 13. Verantine; 14. Perchlorrubian; 15. Rubiagine; 16. Grape-sugar; and 17. Succine.

Dyers employ *M.* for giving the celebrated Turkey-red to cotton goods, and for this purpose employ means for developing the alizarine; and for purples, lilacs, and pinks, which are obtained by means of the purpurine. Manchester, Glasgow, Paisley, Alexandria, and other places on the banks of the Clyde, are the chief seats of this industry; and the annual imports of *M.* into Britain exceed 20,000 tons, amounting in value to nearly a million sterling.

MADDER-LAKE, a painter's colour, made from madder, by boiling it in a solution of alum, then filtering the liquid, and adding sufficient carbonate of soda to cause precipitation of the alizarine or red colouring matter of the madder, which alone has been dissolved by the boiling solution of

alum. This lake is used either as an oil or water colour.

MADEIRA, an island in the North Atlantic Ocean, off the north-west coast of Africa, from the nearest point of which it is 390 miles distant, is lat. 32° 43' N., long. 17° W. It lies 280 miles north of Teneriffe, in the Canaries, and 620 miles south-west of Lisbon. *M.*, and the other islands of the group, form a province of Portugal, with an area of 345 square miles, and pop. (1856) 98,620, of whom 300 are English residents, and about the same number visitors, chiefly English. It has been compared, in appearance, to the island of Arran, in the Firth of Clyde, but is wilder and grander. Its coasts are steep and precipitous, rising from 200 to 2000 feet above sea-level, comprising few bays or landing-places, and deeply cut at intervals by narrow gorges, which give to the circumference the appearance of having been *crimped*. From the shore, the land rises gradually to its highest point, the Pico Ruivo, 6050 feet; there are several other peaks upwards of 4000 feet high. It is remarkable for its deep valleys, the most noted being that of 'Curral,' which from brink to bottom has a depth of 2060 feet. *M.* is of volcanic origin, and slight earthquakes sometimes, though rarely, occur. The lower portions of the island abound in tropical plants, as the date-palm, plantain, sweet potato, Indian corn, coffee, sugar-cane, pomegranate, and fig. The fruits and grains of Europe are cultivated to an elevation of 2600 feet above the sea-level, and extensive tracts on the lower grounds are devoted to the cultivation of the vine and sugar-cane; above these are found timber (including the chestnut, whose fruit is used extensively by the inhabitants as food), fern, grass, and heath, and the scant herbage of alpine regions. *M.* produces 80 or 90 plants peculiar to itself, but the flora in its general characteristics resembles that of the countries around the Mediterranean Sea. The grape disease has, within recent years, been almost universal, and wine has not been made in such quantity as formerly. *M.* has no indigenous mammalia, but the ordinary domestic animals, together with rabbits, rats, and mice, have been introduced by the Portuguese. The climate is remarkable for its constancy. There are only 10° difference between the temperatures of summer and winter, the thermometer in Funchal (the capital of the island) shewing an average of 74° in summer, and of 64° in winter. At the coldest season, the temperature rarely is less than 60°, while in summer it seldom rises above 78°; but sometimes a waft of the *leste*, or east wind, raises it to 90°. The temperate and constant warmth of its climate has made it a favourite resort for invalids affected by pulmonary disease. Besides the English church, there are other places of worship, including a Presbyterian church in connection with the Free Church of Scotland. The educational institutions comprise the Portuguese College and Lancasterian and government schools. Funchal (q. v.), with a population of 25,000, is the port of the island. In 1859, 408 vessels, of 194,106 tons, entered and cleared the port. The imports in 1859, consisting chiefly of cotton, woollen, and linen manufactured goods, iron, flour, earthenware, Indian corn, rice, sugar, and timber, amounted to £167,233; the exports for the same year, consisting of wine, sugar, oranges, lemons, and wicker-work, coal, salt-beef, and hides, amounted to £94,496. The quantity of wine exported in 1859 was 124,180 gallons, value £67,948, more than two-thirds of the whole value of the exports. The trade is chiefly with Great Britain.

The inhabitants of *M.* are of mixed Portuguese, Moorish, and Negro descent; they are of vigorous

frame, lively and industrious, but totally uneducated. M. was formerly covered with forests, whence its name—the Spanish word *madera* signifying timber. The group to which this island belongs, sometimes called the Northern Canaries, was discovered in 1416, and was shortly afterwards colonised by the Portuguese. Compare White's *Madeira, its Climate and Scenery*.

MADEIRA, or MADERA, or CAYARA, an important river of Brazil, South America, and an affluent of the Amazon, has its origin in the confluence of several rivers, the chief of which are the Beni, Mamore, Madalena, and Stanez, in lat. about 10° S. It has a north-east course of 700 miles, for the last 500 miles of which it is navigable, the remaining 200 being obstructed by numerous cataracts; and it falls into the Amazon in lat. 3° 25' S., long. 59° 45' W. Including the Mamore, the entire length is about 1500 miles.

MĀDHAVA is an appellation of the Hindu god Vishṇu (q. v.), one by which he is very frequently designated in Hindu mythology and in Sanscrit poetry.

MĀDHAVĀCHĀRYA (i.e., *Mādhava*, the Acharya, or spiritual teacher) is one of the greatest Hindu scholars and divines that graced the medieval literature of India. He is famed for his numerous and important works relating to the Vedic, philosophical, legal, and grammatical writings of the ancient Hindus, and also for his political connection with the history of some renowned kings of the Deccan. His learning and wisdom were so eminent, that he was supposed to have received them from the goddess Bhuvanēśvarī, the consort of Śiva, who, gratified by his incessant devotion, became manifest to him in a human shape, conferred on him the gift of extraordinary knowledge, and changed his name to Vidyāraṇya (the Forest of Learning), a title by which he is sometimes designated in Hindu writings. All the traditions about M., however differing from one another, agree in ascribing the origin of Vijayanagara to Mādhava. His birthplace is said to have been Pampa, a village situated on the bank of the river Tungabhadra; and as all the accounts of his life admit his having been the prime-minister of Sangama, the son of Kampa, whose reign at Vijayanagara commenced about 1336, and to have filled the same post under King Bukka I., who succeeded Harihara I. about 1361, and as he died at the age of ninety, the date of his birth coincides probably with the beginning of the 14th century. Amongst his works, the principal are his great commentaries on the Rīg-, Yajur-, and Sāma-veda (see VEDA); an exposition of the Mīmāṃsā philosophy; a summary account of fifteen religious and philosophical systems of Indian speculation; some treatises on the Vedānta philosophy; another on salvation; a history of Śaṅkara's (q. v.) polemics against multifarious misbelievers and heretics; a commentary on Parāśara's code of law; a work on determining time, especially in reference to the observation of religious acts; and a grammatical commentary on Sanscrit radicals and their derivatives. The chief performance of Mādhava is doubtless the series of his great commentaries on the Vedas, for without them no conscientious scholar could attempt to penetrate the sense of those ancient Hindu works. In these commentaries, Mādhava labours to account for the grammatical properties of Vedic words and forms, records their traditional sense, and explains the drift of the Vedic hymns, legends, and rites. That in an undertaking almost unparalleled, in the literary history of any nation, for its magnitude and difficulty, Mādhava

should have committed sundry inaccuracies—the remedy against which, however, is really always afforded by himself—can surprise no one; but when modern Sanscrit philology affords the spectacle of writers haughtily exaggerating these shortcomings, and combining with their would-be criticisms the pretence of establishing the true sense of the Vedas without the assistance of Mādhava, a mere comparison of the commentary of the latter with what the European public is called upon to accept as its substitute, adds a new testimony to the vast superiority of the Hindu scholar over his European antagonists. See VEDA. Some of Mādhava's works seem to have been lost.

MADHUCĀ. See BASSIA.

MADIA (*Madia*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, having seeds without pappus, the outer ones situated between the leaves of the involucre, the flowers yellow, the exterior ones rather shortly ligulate, those of the disk tubular. The plants of this genus are annual, of upright habit, rough with glandular hairs, and very viscid; they are important on account of the utility of the seeds as a source of vegetable oil. *M. sativa*, a native of Chili, is there called *Madi* or *Melosa*, and is generally cultivated as an oil-plant. It is 3–5 feet high, has ovato-lanceolate, entire leaves; the flowers terminal, and crowded upon the leafy branches. It has been known in Europe since the beginning of the 19th c., but first began to be cultivated in fields as an oil-plant in 1839. The results of experiments in its cultivation have not, however, in most cases been so favourable as was expected; yet it deserves attention, as it is only annual, does not suffer from frost, does not demand a very good soil, and produces an excellent oil. *Madia* oil is richer than poppy oil, almost entirely inodorous, of a bland, agreeable taste, and very suitable for oiling machines, as it does not freeze even at a cold of 10° F. The oil-cake is a good food for cattle. The straw and chaff have poisonous properties. It is, however, a great disadvantage that the flowers ripen gradually in succession, so that the first are already fallen off, when the last are not yet ripe. The cultivation of *Madia sativa* has not yet been attempted on a considerable scale in Britain.—Another species, *M. elegans*, is cultivated in flower-gardens.

MADISON, JAMES, American statesman, and fourth President of the United States, was born at King George, Virginia, March 16, 1751. His father, James Madison of Orange, was of English ancestry. He graduated at Princeton, N. J., in 1771, and studied law. In 1778, he was a member of the Virginia Convention, and though too modest for an orator, his life from this time was devoted to politics, and he became one of the most eminent, accomplished, and respected of American statesmen. He was elected to the Federal congress in 1779; in 1784 to the legislature of Virginia, in which he supported the measures of Mr Jefferson in the revision of the laws, and placing all religious denominations on an equality of freedom without state support. As a member of the Convention of 1787, which framed the Federal constitution, Mr Madison acted with Jay and Hamilton, and with them wrote the *Federalist*. He did as much as any man, perhaps, to secure the adoption of the constitution, but opposed the financial policy of Hamilton, and became a leader of the Republican or Jeffersonian party. He declined the mission to France, and the office of Secretary of State, but in 1792 became the leader of the Republican party in congress, and wrote the Kentucky Resolutions of 1798, which contain the basis of the state-rights

doctrines. Virginia, in the adoption of the constitution, declared her right to withdraw from the confederation, and at this early period established two state arsenals and made other preparations to resist the encroachments of a centralising power. In 1801, Mr Jefferson having been elected President, Mr Madison was made Secretary of State, which post he held during the eight years of his administration. In 1809, he was elected President. The European wars of that period, with their blockades and orders in council, were destructive of American commerce. The claim of the English government to impress seamen from American vessels was violently resisted. Mr Madison vainly endeavoured to avoid a war with England, which was declared in 1812, and continued for two years, at a cost of 30,000 lives and 100,000,000 dollars. He was one of the four presidents elected for a second term, during which he approved the establishment of a national bank as a financial necessity—a measure he had opposed and vetoed. In 1817, he retired to his seat at Montpelier, Virginia, where he continued to serve his country as a rector of the university of Virginia, and a promoter of agriculture and public improvements. Without being a brilliant man, he was a statesman of eminent ability and purity of character. He died at Montpelier, January 28, 1836.

MADISON, a city of Indiana, United States of America, on the Ohio River, founded in 1808, lies 100 miles west-south-west of Cincinnati. It is finely situated on an elevated plateau, with a background of hills; has a court-house, 2 markets, 3 banks, 18 churches, cotton, woollen, and iron factories, several flouring-mills, large pork-packing establishments, and a flourishing trade. Pop. (1860) 8133.

MADISON, the capital of Wisconsin, United States of America, founded in 1836, is beautifully situated on an isthmus between two lakes, 80 miles west of Lake Michigan, and the same distance east of the Mississippi River. It contains the state capitol, university (founded in 1848), lunatic asylum, historical society, five banks, two daily, and seven weekly papers, two of the latter being in the Norwegian language. It is the centre of a fertile and salubrious country, and has a large trade. Pop. in 1860, 1525; in 1860, 6611.

MADOC, son of Owen Gwynnedd, a Welsh prince, is believed by his countrymen to have discovered America about 300 years before Columbus. Compelled, it is said, by civil strife to abandon his native land, he sailed westward in 1170 with a small fleet, and after a voyage of several weeks, reached a country whose productions and inhabitants were quite unlike those of Europe. Here he lived for a long time; then returning to Wales, he gave an account of the new land that he had discovered, equipped another fleet, set sail again, and was never more heard of. The story of M. will be found in the *Historie of Cambria, now called Wales, a part of the famous Yland of Brytaine, written in the Brytish Language above 200 years past by Geraldus; translated into English by H. Lloyd, gent.; corrected, augmented, and continued by David Powell* (London, 1584). See also *Owen's British Remains* (1777). There is considerable reason for suspecting the genuineness of this Welsh tradition; and even if true, the Northmen have a prior claim to the discovery of America, for it is beyond doubt that Greenland and the New England States were visited, if not colonised, by Icelanders or Norwegians at a much earlier period. Southey has chosen the story of M. as the subject of one of his so-called 'epics.'

MADONNA, an Italian word signifying *My Lady*, and specially applied to the Virgin Mary. It has

now become common in other languages, particularly in reference to works of art. The earliest Christian art, however, did not attempt any representation of the mother of Christ; such representations first make their appearance after the 5th c., when the Virgin was declared to be the 'Mother of God.' The face of the mother is generally full, oval, and of a mild expression; a veil adorns the hair. At first, the lineaments of the Virgin's countenance were copied from the older pictures of Christ, according to the tradition which declared that the Saviour resembled his mother. A chronological arrangement of the pictures of the Virgin would exhibit in a remarkable manner the development of the Roman Catholic doctrine on this subject. The Madonna has been a principal subject of the pencils of the great masters. The grandest success has been achieved by Raphael, in whose pictures of the Madonna there prevails now the loving mother, now the ideal of feminine beauty, until in that of St Sixtus he reaches the most glorious representation of the 'Queen of Heaven.' Among symbolic representations may be mentioned Mary with the white mantle, i. e., the mantle of love under which she receives the faithful; and the Virgin with the half-moon or with the globe under her feet, according to the meaning put upon the twelfth chapter of Revelation. The Virgin was never represented without the Child until comparatively recent times.—For further information, the reader should consult Mrs Jameson's delightful work, *Legends of the Madonna* (Lond. 1852).

MADOQUA (*Antelope Saltiana*, or *Neotragus Saltianus*), a species of antelope, abundant in Abyssinia; one of the smallest, if not the very smallest of horned animals, being scarcely the size of a hare. Its legs are long and slender; its tail very short; its horns short and conical, the males alone having horns; the general colour is gray, the fore-parts reddish.

MADRAS, one of the three presidencies of the Indian empire, occupies the greater part of the south of the peninsula of Hindustan. It may be considered as consisting of the following five divisions: 1. The north division, comprising the provinces of Ganjam, Vishakhapatnam, Rájamahendri, and Machilipatanam; 2. The central division, including Guntur, Nellore, Chingalapat, North Arkat, and South Arkat; 3. The south division, including Salem, Koimbatour, Trichinapalli, Tanjúr, Madras, Tinneveli, and the territory of the Rájáh of Tanjancur; 4. The Maisur (Mysore) division, including Maisur, Malabar, and Kanara; 5. The ceded districts, Kadapa, Bellári, and Karnúl. Besides these, Nágpur and the Nizam's territory are under the government of Madras. Area, including the Nizam's territory and Nágpur, 355,846 square miles. Pop. 43,636,365. The physical features, industry, &c., are given under the several districts.

MADRAS (called by the natives *Chennampattanam*, 'the city of Chennappa,' an Indian prince), a maritime city of British India, capital of the presidency of the same name, is situated on the Coromandel coast, the western shore of the Bay of Bengal, in lat. 13° 5' N. No commercial centre of equal size and importance is so unfortunately in its site. The roadstead is open to every wind except that from the west, and in the case of a sudden gale, vessels are obliged to run for the open sea. The city is not built on a navigable river; the soil of the vicinity is but moderately productive; and during the hot months, the thermometer, even in a well-appointed room, rises to 95°. In calm weather, the surf breaks 300 feet from the shore, and its wave is 3 feet in height; during

a storm, it breaks 1000 feet from shore, with a wave 14 feet high, and at such a time any attempt to land, even in the boats of the natives built for the purpose, is most dangerous. The seasons are distinctly marked by the monsoons, the north-east lasting from October to February, and the south-west from May to October. The force of the latter, however, is so much broken by the Ghats that its influence is hardly felt. During the hot months, the climate of M. is pleasantly modified by a sea-breeze, called by the residents 'the doctor,' which sets in at noon, and lasts till night. The city, with its suburbs, which are nine in number, extends along the coast for 8 miles, and has an average breadth of 1½ miles. On the coast, and midway between the north and south extremities of the city, is Fort St George, strongly fortified, and garrisoned usually by a regiment of European troops and two companies of artillery; there are also, however, three regiments of native infantry generally stationed here. Within the fort are comprised the council-house and a number of civil and military offices. The district of Black Town, north from the fort, lies low, in some places being only 6 inches above sea-level at spring-tide. It is defended, like the fort, from the encroachments of the sea by a strong stone bulwark. In Black Town are the Seven Walls, the water of which, filtered through a bed of fine sand, is exceedingly pure and wholesome. The principal buildings and institutions are Government House, a handsome edifice, though much inferior to the similar establishments in Calcutta, and even in Bombay; the Light-house, to the north of the fort, 128 feet above sea-level, and having a light, said to be one of the most brilliant in the world; the Scotch Church of St Andrew, founded in 1818, a stately and beautiful edifice; the University, with three European professors, and numerous teachers, both European and native, and containing a valuable museum and a library; St George's Cathedral, from which a magnificent view of the city and its vicinity may be obtained, and containing several monuments by Chantrey (including one of Bishop Heber), and some figures by Flaxman. There are also military and female orphan asylums, a medical school, a branch of the Royal Asiatic Society, the Madras Polytechnic Institution, the Government Observatory, a mint, eight established Episcopal churches, the numerous dissenting places of worship, and the Madras Club, to which members of the Bengal and Bombay clubs are admitted as honorary members. Madras stone, or chert, is largely employed in the decoration of public buildings. When laid upon walls, pillars, &c., dried and polished, it has the appearance of the finest Parisian marble.

The first British settlement on this coast was at Amegga, 60 miles north of M.; but the cost of the present fort being granted by a native prince in 1639, a removal took place, and the nucleus of the present city was at once formed. M. is now the residence of the government of the presidency, including the governor, the members of council, &c., and of the judges of the Supreme Court. The table of the European is supplied from the well-stocked markets with beef, mutton, veal, lamb, fowls, turkeys, game, fish, &c., and with the familiar potato, turnip, carrot, cabbage, &c., combined with the mangoes, plantains, pine-apples, guavas, &c., of the country. Pop. 720,000, 1600 of whom are Europeans, and the great body of the remainder Hindus. Nine newspapers are published here. In 1857, 6941 vessels, of 652,146 tons, besides 1438 square-rigged vessels, and 4803 native craft, entered the port. Imports, valued at 40,543,326 rupees (£2,760,805 nearly); exports at 40,000,656 rupees (£2,712,987 nearly).

MADRAS SYSTEM. See **MUTUAL INTERESTION.**

MADREPORE (*Madrepore*), a genus of zoophytes (*Ascidia*), the type of a family, *Madreporida*, in which the polypus have twelve short tentacles, and the polypodium is stony. The name, however, is often more extended in signification, and popularly is not clearly distinguished from CORAL. The polypodium is sometimes arborescent and branched, sometimes spread out in a leaf-like form. The cells in the true madrepores are isolated and lamellated, spread over the surface of the polypodium like little stars. The variety of forms among the *Madrepore* (*Ascidia asenae*), madrepores is very great, and many of them are very beautiful. They are all found in the seas of warm parts of the world. The *Ascidia* are generally in large convex masses, the surface hollowed with crowded stars. They increase with great rapidity, as do some of the other madrepores, and are often found in huge masses, composing some of the most recently formed rocks.

MADRID, the capital city of Spain, in the province of the same name in New Castile (see **CASTILE**), is situated near the centre of the country, on the left bank of the Manzanares, a small stream whose waters join those of the Jarama, an affluent of the Tagus. It is built on a hilly, barren, and ill-watered plateau, 2080 feet above sea-level, offering, on the one hand, no protection against the bitter north winds from the snowy peaks of the Guadarrama Mountains, and on the other, open to the Solses, the south-eastern wind, which, aided by a glaring sun, often raises the temperature to 90° and even to 105° in the shade. In winter, the temperature sometimes falls to 15°. Summer, however, is the most trying period. During this season, the sunny and shady sides of the same street may differ 30° in temperature. Not without justice has the climate of M. been proverbially described as *tres meses de invierno y nueve de infierno* (three months of winter and nine months of hell). The rate of mortality is 1 in 20 to 24. The city is circular in shape, and is surrounded by low walls pierced by 16 gates. Besides other ecclesiastical edifices, it contains 32 churches, some of which are worthy of special mention; 15 nunneries (44 monasteries were suppressed in 1836), 17 hospitals, 14 barracks, 94 elementary schools (besides several academies), 1 university, 8 theatres, 26 daily newspapers, and numerous literary and artistic institutions. The number of palaces is great. The principal architectural feature is the Royal Palace (*Palacio Real*), a splendid edifice, built of granite, and of a stone resembling white marble. It is a square 470 feet in length on each side, and 100 feet in height, and encloses a court 240 feet square. There are two libraries, the public and the private royal libraries: the former, containing 200,000 vols., is well kept and tended, the latter, with 100,000 vols., is rapidly falling to decay. The royal armoury is one of the finest in the world; the Toledo blades, the artistic armour, and shields from Augsburg and Milan, are superb. The armoury contains relics of the greatest Spanish epochs, and furnishes in itself a realisation of Spanish history. The Museo, said to be one of the finest picture-galleries in the

world, besides specimens of many other famous painters, contains 10 of Claude, 22 of Van Dyck, 16 of Guido, 46 of Murillo, 21 of N. Poussin, 10 of Raphael, 62 of Rubens, 52 of Teniers, 43 of Titian, 27 of Tintoretto, 62 of Velasquez, 24 of Paul Veronese, and 10 of Wouvermans. Of all these pictures, the most wonderful are those by Velasquez, whose finest work is here, and who, indeed, can here only be studied to advantage. The general aspect of M. is that of a new city, with fine houses, streets, and squares. In the squares are numerous statues—as that of Philip IV. (in the *Plaza de Oriente*), a splendid equestrian work, 19 feet in height, and weighing 180 cwt.; the statue of Cervantes, &c. In and around the city, also, are numerous public walks. The manufactures of the city are unimportant. The artisans and tradesmen are supported by the court, the nobility, the officials, and the innumerable body of place-hunters. Pop. 475,785.

The first historical mention of M. occurs under Ramiro II., king of Leon, who took this city in 932. In 1083, when M., or, as it was then called, Majerit, was captured by Alfonso VI. of Castile, it was merely a Moorish fortified outpost of Toledo. It rose into some importance in the beginning of the 16th c., when Charles I. (afterwards the Emperor Charles V.) removed his court hither. In 1560, it was declared the only court by Philip II. A number of memorable treaties have been concluded in M., and bear its name, particularly that between Charles V. and Francis I. of France in 1526; that between Spain and Venice in 1617; and that between Portugal and Spain in 1800. In the Spanish War of Succession, it favoured the French party; and in the war of freedom against France, it gave the signal for a general rising by an insurrection against Murat on 2d May 1808, in which 1500 of the citizens of M. lost their lives. From 1809 till 1812, it was held by the French; but in the latter year, the Duke of Wellington entered it, and replaced it in the hands of its legitimate rulers. In the more recent contests between the Carlists and Christians, the Spanish capital has favoured the cause of the latter.

MADRIGAL, a word of uncertain etymology, denotes a short lyrical poem, adapted to the quaint and terse expression of some pleasant thought, generally on the subject of love. The proper madrigal consists of three verses or strophes, generally bound together by rhymes; but this form is not always adhered to, and the name is sometimes applied to little love-poems of any form. Among the Italians, the best writers of madrigals are Petrarch and Tasso; among the French, Montreuil, Lainez, and Moncrif; among the Germans, Ziegler (the earliest), Voss, Manso, Goethe, and A. W. Schlegel; and among the English, the poets of the Elizabethan and Caroline ages, several of whom, such as Lodge, Withers, Carew, and Suckling, have written verses, sometimes called madrigals, sometimes songs, the grace and elegance of which have never been matched.—The name madrigal is also applied to pieces of vocal music of a corresponding character. The musical madrigal, which originally was a simple song sung in a rich artistic style, but afterwards with an instrumental accompaniment (generally the organ), is believed to have originated with the Flemings, and dates from the middle of the 16th century. It went out of fashion about the beginning of the 18th c., but the later *glee* may be regarded as a similar composition. The English madrigalists are especially famous. Neither Italy nor the Netherlands has produced greater names than Morley, Wilbye, Bennett, Ward, Orlando Gibbons, Dowland, and Ford.

MADURA, an island, separated by a narrow strait from the north-east of Java, about 90 miles long and 24 broad. In 1850, the population amounted to 325,000, of whom 6500 were Chinese, 10,000 Malays, and many other foreigners. From a later census (1858), it appears that the population has increased to 509,829 souls. The natives of M. are active, honest, brave, and industrious. They are mostly Mohammedan, though the remains of Hindu temples still bear testimony to the prevalence of that faith in former times. The rivers are small, and the hills never attain to a great height, Padjoedan, the highest, being 1364 ft. above the level of the sea.

M. is a colonial possession of the Netherlands, belongs to the residency of Soerabaya, and is divided into three kingdoms, governed by native princes, under the superintendence of two Dutch assistant-residents. The products of the island, which are included in the trade-returns of Java (q. v.), are sugar, tobacco, indigo, cocoa-nut oil, edible birds' nests, &c.; but owing to the extortions of the princes, agriculture is not flourishing. In 1858, the oil exported had a value of £21,500 sterling, from 40,000 fruit-bearing trees. The stock amounted to 2291 buffaloes, 34,354 head of horned cattle, and 17,276 horses.

MADURA, a maritime district in the south of British India, in the presidency of Madras, is bounded on the E. by the strait which separates Hindustan from the island of Ceylon. It has an area of about 10,700 square miles, and a population of 1,750,000. Eastward from the shore, runs a narrow ridge of sand and rocks, mostly dry, and which almost connects Ceylon with the continent. Cotton is the chief commercial crop; and sugarcane, betel-nut, and tobacco are also grown. The principal town is Madura, on the river Vygat, with several noteworthy public buildings.

MÆANDER (now *Meander*), the ancient name of a river of Asia Minor, rising near Celene, in Phrygia, and flowing in a south-western direction into the Icarian Sea at Miletus. It is noted for its numerous windings—whence the English word *meander*, applied to any stream, signifies to flow in a winding course.

MÆCENAS, C. CILNIUS, a Roman statesman, celebrated for his patronage of letters, was born in the early part of the first century before Christ. His family was of Etruscan origin, and of royal descent (Hor. *Carm.* i. 1), perhaps from Porsena. He received an excellent education, was familiar with Greek and Roman literature, and occasionally did a little in the way of authorship himself. His first appearance in public life dates after the assassination of Julius Cæsar (44 B.C.), when he figures as the friend and adviser of Octavian. He had, it is clear, a talent for private diplomacy, and was employed mainly in that capacity. He 'arranged' a marriage between Octavian and Scribonia, made up (temporarily) the differences between Octavian and Antony, and brought about the peace of Brundisium. In 36 B.C., he was in Sicily, helping Octavian, as usual. Five years later, when the latter was fighting the great and decisive sea-battle of Actium with his rival Antony and the Egyptian princess Cleopatra, M. proved himself a vigilant governor of Rome, by crushing a conspiracy of the younger Lepidus, and thereby preventing a second civil war. When Octavian became emperor under the title of Augustus (a step which he is said to have taken by the advice of M., who was profoundly impressed with the necessity of a 'strong government' to repress the anarchic elements of the period), the latter was appointed administrator of all Italy.

The nature and extent of his official power are not very precisely understood, but they were undoubtedly great, though the influence and authority of M. are to be estimated rather from his intimacy with the emperor than his mere position as a public servant. This intimacy—friendship it might, perhaps, be called—continued uninterrupted for many years; but sometime before 16 a.c., it was ruptured from causes which cannot now be ascertained. No enmity, however, ensued. M. was a thoroughly sincere imperialist. He had a belief in the value of an established government; and when he found that he no longer retained the confidence of his sovereign, he did not lapse into a conspirator; but, as a modern minister might do, retired into the obscurity of private life. Literature and the society of literary men now occupied all his time. He was immensely rich, and kept an open table for men of parts at his fine house on the Esquiline Hill. M.'s intercourse with Horace especially was of the most cordial nature, and equally honourable to both. So far as personal morality went, M. was a thorough pagan—not a bad man in the usual sense of the word, but copiously addicted to sensual delights. His adulteries—if not worse—were the talk of the city; he dressed effeminately, had a passion for theatrical entertainments, paid great attention to cookery, gardening, &c.; and in short, in his theory of life, was an Epicurean of 'the baser sort.' It does not, therefore, surprise us to find that he was a valetudinarian and a hypochondriac, and that he died childless, 8 a.c. He left the bulk of his property to Augustus.

MAELAR, LAKE, one of the largest and most beautiful lakes in Sweden, about 81 miles in length; its average breadth about 13, and its area about 525 square miles. It contains upwards of 1200 islands. Its east end is close by Stockholm, where its waters are poured into the Baltic Sea, the difference of level being scarcely six feet. The banks are very much varied with wood, lawn, and cliffs, and are adorned with many castles, country-seats, and villas. They are generally very fertile and well cultivated, and upon them are situated, besides Stockholm, the towns of Enköping, Westera, Köping, Arboga, Strängnäs, Thorshälla, Mariefied, and Sigtuna.

MAESTO'SA, a term in music, meaning with majesty or dignity. It is frequently followed by *con gravità*.

MAESTRICHT BEDS. In Britain, the chalk with flints is covered with Tertiary strata, but at Maastricht in Holland there occurs a thickness of 100 feet of soft yellowish limestone, abounding in the remains of Corals and Bryozoa, sometimes, indeed, entirely made up of them. The fossils are peculiar, and quite distinct from Tertiary species. Yet a considerable interval must have elapsed between the deposition of the Maastricht beds and the underlying chalk, for that has been abraded before the deposition of the newer beds. The most remarkable fossil found in these strata is the gigantic marine reptile *Moscosaurus* (q. v.).

MAFFEI, FRANCESCO SCIPIONE, MARCHESE, an eminent Italian author, was born at Verona, 1st June 1675, and studied in the Jesuit College at Parma. He spent part of his youth in military service, under his brother ALESSANDRO, who greatly distinguished himself in the Spanish War of Succession, and who finally rose to the rank of a field-marshal; but his love of literature prevailed over the desire of military renown, and he devoted himself to literary pursuits. He was for some time one of the editors of a critical journal, intended to promote among the Italians an acquaintance

with foreign literature. His tragedy of *Merope* (Modena, 1713) was received with great approbation, and went through 70 editions in M.'s lifetime. His comedy of *La Ceremonia* soon followed, and was also successful. M. was a zealous promoter of the study of the Greek language and literature in Italy, and bestowed much labour on the examination of ancient manuscripts. His *Verona Illustrata* (Ver. 1731—1732; new ed., 8 vols., Ver. 1792—1793) is a work of much value and learning. He died 11th February 1755. A collective edition of his works was published at Venice in 1790, in 21 vols.

MA'IRA, a small town of Portugal, in the province of Estremadura, 18 miles north-west of Lisbon. Pop. 3250. It is remarkable only for its palace and convent, which form an enormously large and most striking edifice. It is 780 feet in length, and 690 feet in width, contains in all 866 rooms, with 5200 windows, and about as many doors: 10,000 men, it has been said, could be reviewed on its roof. It was built by King John V. (1717—1731), and is splendidly fitted up and decorated. The library contains 30,000 vols., and is 300 feet in length; its pavement consists of white and red marble; and the bookcases are made of the most costly woods.

MAGADO'XO, or **MUKDISHA**, a commercial town on the eastern coast of Africa, on the Somali coast, in lat. 2° 2' N. It was built by the Arabs in 924, for the purposes of trade, and was a flourishing place when the Portuguese first visited it. It now belongs to the Imaum of Muscat, whose flag floats above the town. Pop., inclusive of slaves, about 5000. It exports dhurra, beans, pease, cattle, cotton, spices, &c.

MAGAZINE (a word derived from the Arabic *Makhzan*), literally means any place where stores are kept; but as a military expression, magazine always means a *powder-magazine*, although arms may at times be kept in it. A magazine may be a dépôt where vast quantities of gunpowder are held in reserve, an entrepôt for the supply of several advanced works, a battery magazine for the wants of a fortress during a siege, or merely an expense magazine for the daily requirements of the special battery in which it may be situated. The last is usually temporary, and hollowed out in the back of the rampart; but the other forms require most careful structure. They must be bomb-proof, and therefore necessitate very thick walls; they must be quite free from damp; and they should admit sufficient daylight to render the use of lanterns within generally unnecessary. Magazines are commonly built of brick, the solid masonry being arched over within, and a thickness of earth sometimes added above the brickwork, to insure impermeability to shells. The entrance is protected by shot-proof traverses, lest an opening should be forced by ricochet shots. Within, a magazine is divided into bins or compartments, and one of these should always be kept empty, in order that the barrels of powder may frequently be moved from one place to another, a process necessary to keep it in good condition. A battery magazine commonly contains 500 rounds for the guns dependent on it. Dépôt magazines should, when possible, be limited to 1000 barrels of powder.

In a ship, the magazine is strongly built in the hold; it is divided by a transparent screen from the *light-room*, in which are kept properly provided lanterns, the introduction of fire in any form into the magazine itself being absolutely forbidden. The explosion of the magazine is, of course, equivalent to the destruction of the ship, and therefore means are devised by which, on the least appearance of

fire in its vicinity, the magazine may be immediately flooded.

The term magazine has been applied to a well-known class of periodical publications, usually issued monthly, and containing miscellaneous pieces in prose and verse, to which at one time was appended a chronicle of public events. The oldest of this class of works is the *Gentleman's Magazine*, begun by Edward Cave in 1731.

MAGDALEN COLLEGE, Oxford; in full, The College of St Mary Magdalene. William Patten, commonly called Waynflete, from the place of his birth, successively head master of Winchester, master of the Lesser House of St Mary Magdalene, near Winchester, Bishop of Winchester, and Lord High Chancellor, founded the Hall of St Mary Magdalene in 1448. In 1457, he obtained a licence from the king to found a college into which he transferred the president and scholars of the Hall. Magdalen is in many respects the most remarkable college in Oxford, and Wood declares it to be 'the most noble and rich structure in the learned world, that is to say, that if you have regard to its endowment, it excelleth, all things considered, any society in Europe.' There were on the original foundation a president, 40 fellows, 30 scholars called demies, 12 chaplains, and 16 choristers. The fellowships and demyships were confined to certain specified dioceses and counties. By ordinances passed under the powers of 17 and 18 Vict. c. 81, the constitution of the college has been considerably changed. All restrictions on fellowships and demyships are to be abolished. The demyships are to be of the value of £75 per annum, and 10 are to be added to the statutable number. Twenty exhibitions of the same value were at the same time founded. Four professorships—of Moral Philosophy, Chemistry, Mineralogy, and Physical Geography—of the value of £600 per annum, are to take the place of three lectureships—of Divinity, Moral Philosophy, and Natural Philosophy, which were founded by Waynflete. In order to carry out these changes, ten of the fellowships are suspended. By the same ordinance, it is directed that the fellowships are not to exceed £300 per annum, exclusive of rooms. This college is one of great beauty, and, as is well known, is rich in historical associations. It has 39 benefices in its gift.

MAGDALEN HALL, Oxford. This Hall was founded at the same time as Magdalen College. Up to 1602, it was a sort of school for students previous to admission to the college, and was governed by one of the college fellows. It then became an independent Hall, and in 1822 was removed to the seat of the former Hertford College. This Hall presents to one benefice, and possesses 8 scholarships and 4 exhibitions. They are all tenable for three years.

MAGDALEN ISLANDS, a small group near the centre of the Gulf of St Lawrence, 54 miles north-west of Cape Breton Island, and about the same distance north from Prince Edward's Island. They consist chiefly of Coffin, Amherst, and Grindstone Islands, and about 2000 inhabitants, who are supported by the productive cod, herring, and seal fisheries of the neighbouring waters.

MAGDALENA, the principal river of the Granadian Confederation, South America, has its origin in a mountain lake at the south extremity of the Eastern Cordillera. After a northern course of 900 miles, it falls into the Caribbean Sea, in lat. 11° N., long. 75° W. Of its course, the upper portion is rapid, and interrupted by many cataracts; the lower portion is through a great plain. It is navigable to Honda, 540 miles from its mouth;

chief affluent the Cauca. The area drained by the M. is estimated at 110,000 square miles.

MAGDALENE, MARY, or MARY OF MAGDALA, so named from a town on the Sea of Galilee, a woman 'out of whom Jesus cast seven devils,' and who believed in him and followed him. She was one of the women who stood by his cross, and one of those who went with sweet spices to the sepulchre. To her he first appeared after his resurrection. In consequence of an unfounded notion identifying her with the woman mentioned in Luke vii. 36—60, who anointed our Lord's feet with ointment, and wiped them with the hair of her head, Mary M. has been long and generally regarded as a woman whose early life had been very profligate, although of this there is no hint whatever in the narratives of the evangelists; and the Magdalenes, so frequent amongst works of art, represent her according to this prevalent opinion.—The very name Magdalene has come to be applied to women who have fallen from chastity, and institutions for the reception of repentant prostitutes are known as *Magdalene Asylums*.

MAGDALENE COLLEGE, Cambridge, was founded in 1519 by Thomas, Baron Audley of Walden, who left for this purpose the impropriate parsonage of St Catherine Cree Church, London, and also a considerable part of the city, anciently called Cowen Garden, Christ Church. It has eight open fellowships on the foundation. The other fellowships are named after the persons who have made benefactions to the college—Spendliffe, Wray, Drury, and Millington. M. C. has 12 scholarships—3 of £80, 3 of £40, and 6 of £20 each—all of which are likewise named after their founders; besides 18 exhibitions, 6 of which are for scholars from Shrewsbury School, 3 for scholars from Wisbeach School, and 4 for scholars from Leeds, Halifax, and Haverham Schools. There is also an annual benefaction, called the Pepsyan, worth £50, in the gift of the master, and generally bestowed by him upon poor and deserving students. M. C., in 1862, counted 27 undergraduates, 130 members of the University senate, and has the patronage of 7 benefices.

MAGDEBURG, chief town of Prussian Saxony, is situated in 52° 8' N. lat., and 11° 40' E. long., and has a population of 86,301 (including its suburbs and its citadel), is one of the most strongly fortified and most important commercial towns of Prussia, and the focus of four of the principal lines of railway in Germany. It lies on the left bank of the Elbe, and is surrounded by extensive suburbs, known as Neustadt and Sudenburg, but with the exception of one long and wide thoroughfare, the *Breite Weg* (Broadway), it consists mostly of narrow and crooked streets. M. is the seat of the governmental courts of appeal and administration, and of a superintendent-general of the Evangelical Church. It has two gymnasia, a normal school, institutions for the deaf and dumb and blind; schools of arts, trades, practical mining, medicine, surgery, and midwifery; and is well provided with institutions for the promotion of charitable purposes. Its most remarkable buildings are the cathedral, built between 1208 and 1363, and containing the graves of the Emperor Otho, the founder of the city, and of his first wife, the English princess Editha, and the sarcophagus of Archbishop Ernest, sculptured in 1497 by P. Vischer of Nürnberg; the town-hall, in front of which stands the memorial of Otho the Great, erected after his death in 973, by the magistracy of M., in grateful remembrance of the favours which he had conferred upon the city; the government house, the barracks, and the theatre. The industrial products of M. embrace

silk, cotton, and woollen goods, gloves, ribbons, and leather, and it has manufactories of tobacco, chicory, lead, sugar, and vinegar, and extensive breweries and distilleries. The transit and commission trade is very considerable; there are annual wool and other markets; and trade is facilitated by rail, and by steam and canal navigation. In 967, M. was raised to the dignity of being selected by Pope John XIII. as the see of the primate of Germany, while it had already acquired the rights of a free city under Charlemagne. During the middle ages, the archbishops and the magistracy were frequently at war; and M. early adopted the Reformed doctrines, and thus brought upon itself the combined wrath of the emperor and the archbishops. Its greatest troubles are, however, connected with the Thirty Years' War, when, after sustaining a siege for 28 weeks against the imperialists under Tilly, the city was taken, sacked, and nearly burned to the ground; the cathedral and about 150 houses being all that remained after the three days' sack to which it had been exposed. Thirty thousand of the inhabitants were slain, and numbers threw themselves into the Elbe, to escape the fury of the invaders. In 1648, the archbishopric was converted into a secular duchy, and conferred upon the House of Brandenburg, in compensation for the loss of Pomerania. In 1806, it was taken by the French, and annexed by them to the kingdom of Westphalia; but finally restored to Prussia, in consequence of the downfall of Napoleon in 1814.

MADGEBURG CENTURIES, the name given to the first comprehensive work of Protestant divines on the history of the Christian Church. It was so called because it was divided into centuries, each of which occupied a volume, and because it began to be executed at Madgeburg (q. v.). The originator of the work was Matthias Flacius (1552), and the purpose he had in view was to demonstrate the identity of the Protestant doctrines with those held by the primitive church, and the departures of the Roman Catholic Church from the same. Joh. Wigand, Matt. Judex, Basilus Faber, Andr. Corvian, and Thom. Holzhuter were Flacius's principal fellow-labourers; and several Protestant princes and noblemen defrayed the heavy expense incurred in the preparation of the work. The writers, who are called *Centuriators*, brought their work down only to the year 1300. It was published at Basel (13 vols., 1559—1574); Baumgarten and Semler began a new edition (6 vols., Nürnberg, 1757—1765). The *Magdeburg Centuries* displays great learning, accuracy, and sound judgment. The Roman Catholic historian Baronius (q. v.) wrote his *Annales Ecclesiastici* as a reply to it.

MADGEBURG HEMISPHERES are two hollow hemispheres, generally made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stop-cock. When the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force; e.g., if they are one foot in diameter, they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke (q. v.) in 1650, at the imperial diet at Ratisbon, to the astonishment of the Emperor Ferdinand III. and his princes and nobles.

MAGELLAN, or (properly) **MAGALHAENS**, **FERNANDO DE**, a famous voyager, was born in Oporto, of good family, towards the latter half of the 15th century. He served with distinction under Albuquerque in the East Indies; but thinking

his services ill rewarded by the Portuguese court, he went, in 1517, to Spain with his countryman, Ruy Falero, a geographer and astronomer. They laid before Charles V. a scheme for reaching the Moluccas by the west, which was well received by him; and M. sailed on 20th September 1519, with five ships and 236 men, from San Lucar, and proceeding to the mouth of the La Plata, and along the shores of Patagonia, he discovered and sailed through the strait which bears his name; discovered the Southern Pacific Ocean, to which he gave that name upon account of the fine weather which he experienced there; reached the Philippine Isles, and fell in a fight with the chief of the isle of Matan, on 26th April 1521. His ship was safely carried home to Spain, and thus completed, on 6th September 1522, the first voyage ever made round the world. The complete narrative of M.'s voyage was edited by Amoretti (Milan, 1811).

MAGELLAN, or **MAGALHAENS**, **STRAIT OF**, separates South America on the south from Tierra del Fuego. It is 300 miles in length; its breadth varies from 5 to 30 miles; and the navigation is difficult. It was discovered in 1520 by Magalhaens, the Portuguese navigator, and took its name from him.

MAGENDIE, **FRANÇOIS**, an eminent French physiologist and physician, was born at Bordeaux in 1783, and died in Paris in 1855. Through the influence of his father, who practised as a physician in Paris, he became a pupil of Boyer, the celebrated anatomist. At the age of 20, after an examination by Concours, he was appointed prosector in the faculty of medicine, and soon afterwards a demonstrator. He was subsequently appointed physician to the Hôtel-Dieu. In 1819, he was elected a member of the Academy of Sciences, and in 1831, succeeded Recamier in the chair of Anatomy in the College of France.

M.'s chief physiological works are: *Précis Élémentaire de Physiologie* (1816), which went through several editions, and was enlarged into the *Éléments de Physiologie*, which was translated into English, and was for many years the best work on physiology in this language; *Leçons sur les Phénomènes Physiques de la Vie* (1836—1842); *Leçons sur le Sang* (1839); *Leçons sur les Fonctions et les Maladies du Système Nerveux* (2 vols. 1839); and *Recherches Philosophiques et Cliniques sur le Liquide Céphalo-rachidien ou Cerebro-spinal* (1842). He was likewise the founder, and for ten years the editor of the *Journal de la Physiologie Expérimentale*, in which are recorded many of the experiments on living animals which gained for him, too deservedly, the character of an unscrupulous vivisector.

He was the first to prove experimentally that the veins are organs of absorption; he gave a more accurate account of the process of vomiting than had been previously given; he pointed out that non-nitrogenous foods are non-nutritious, and that an animal cannot live solely on any one kind of food, however nitrogenous it may be; he investigated the physiological action and therapeutic uses of hydrocyanic acid and strychnine; he performed an important series of experiments on the cause of death when air is admitted into the larger veins; he made numerous experiments to determine the functions of various nerves and of different parts of the brain; and lastly, he shares, with Sir Charles Bell, the honour of having discovered the separate functions of the two roots of the spinal nerves.

MAGENTA, a Lombard town, in the province of Pavia, situated on the high road to Milan, from which it is distant 12 miles. Pop. 3800. The district in which it stands yields excellent wine and

an abundance of mulberries. In the campaign of 1859, M. was the scene of a decisive victory won by the French and Sardinians over the Austrians. It has given its name to one of the recently-discovered colours derived from coal-tar. See DYE-STUFFS.

MA'GEROE, the most northerly of the larger European islands, belongs to Norway, and lies close to the coast of Finmark, in the Arctic Ocean. It terminates towards the north in the North Cape, 970 feet in height, and situated in lat. 71° 10' N., long. 25° 50' E. M. is 22 miles in extreme length, and 15 miles in breadth, is irregular in shape, and deeply indented by bays. It supports a few Norwegian and Lappish families.

MAGGIO'RE, LAKE, one of the largest lakes in Italy, the *Lacus Verbanus* of the Romans, is situated partly in Piedmont, partly in Lombardy, and partly in the Swiss canton of Ticino. It is about 36 miles in length, and its greatest breadth is about 8 miles. It lies 650 feet above the level of the sea, and its depth is in some places not less than 1800 feet. The river Ticino flows through it. In a south-western expansion of the lake, are the Borromean Isles (q. v.). On the north and west, it is surrounded by granitic mountains; on the south and east, by vineyard-covered hills; and its scenery presents a combination of soft beauty with wild grandeur.

MAGGOT, the popular name of the larvæ of many kinds of dipterous insects, particularly those of the great family *Muscidae* (Flies), although it is often also given to those of *Ætridae* (Bot-flies, &c.). It is more commonly given to those larvæ which feed on animal, than to those which feed on vegetable substances, and particularly to those—of which there are very many species—which feed on putrescent animal matter. *Corpse-worms* are the larvæ of *Sarcophaga mortuorum*, a fly which is always ready—at least in Europe—to lay its eggs in human bodies when deposited in open vaults. The maggots of the Flesh-fly (q. v.) are used for feeding pheasants and as a bait for fish, and means are therefore often used to procure them in abundance, by exposing dead bodies of animals to putrefaction in the open air.

MA'GI (variously derived from *mag* or *mog*, Pehlvi: priest; *mitguth*, a man who wears his hair in a particular manner; *mogh*, distinguisher; &c.) is the name of a tribe of the Medians, which, not unlike that of Levi among the Israelites, were set aside for the management of the sacred rites, and for the preservation and propagation of the traditional knowledge. From the Medians, the institution of the magi found its way, under Cyrus, into Persia, and here rose to the very highest importance, while at the same time they now seem to have extended their inner sphere of action. They were not only the 'keepers of the sacred things, the learned of the people, the philosophers and servants of God,' but also diviners and mantics, augurs and astrologers. They called up the dead, either by awful formulas which were in their exclusive possession, or by means of cups, water, &c. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in private as well as in public life, and, quite apart from the education of the young princes being in their hands, they also formed the constant companions of the ruling monarch. Of their religious system itself, the articles GUZZERS and PARSEES will give a fuller account. Zoroaster (q. v.) (*Zerdusht*) reorganised, in the course of his great religious reform, also the body of the magi, chiefly by reinforcing the ancient laws about their manner and mode of life, which was to be one of the simplest

and severest, befitting their sacred station, but which had become one of luxury and indolence, and by re-instituting the original distinction of the three classes of *Herbeds* (disciples), *Mobeds* (masters), and *Destur Mobeds* (complete masters). The last, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies. Purifications of several months' duration had to precede it, and it was long before the stage of the disciple's 'being led into the realms of the dead' was proceeded with.

Gradually, however, their influence, which one had been powerful enough to raise them to the throne itself (Sassanides), began to wane, and it formerly a number of 80,000 delegates of magi had to decide on the affairs of state and religion, this council, in later times, dwindled down to the number of seven; and from being the highest caste, the priests of God, and the 'pure of mind, heart, and hand,' they fell to the rank of wanderers, jugglers, fortune-tellers, and quacks, and gave the name to the art of sleight-of-hand and performance of conjuring tricks.

MAGIC (see art. MAGI) is a general name for wonderful effects produced in some mysterious way. Medicine in its early form is intimately allied to magic. It would soon be discovered by accident that certain plants produced powerful effects, both good and bad, upon the bodies of men and animals; and the reverence arising from their real virtues would lead to ascribing to them all manner of imaginary ones. The laws of nature being little known, one thing was not more incredible than another; and effects were assigned to causes in the most arbitrary and accidental way. The Rosicrucian physicians treated a case of wounding by applying the salve to the weapon instead of to the wound itself; and this may be taken as the type of magical, as contrasted with rational medicine. In modern times, drugs are mostly drawn from the mineral and vegetable kingdoms; but while the healing art was in the mystic stage, animal substances were most esteemed. If the juice of a plant could affect the living body, how much more must the life-blood of another animal! And the rarer the kind of blood, so much the rarer the virtue. The blood of an innocent child, or of a virgin, was believed to cure the leprosy; that of an executed criminal, the falling sickness. The hearts of animals, as being the seat of life, were held to be potent drugs. The fat of a hog had been found by experience to benefit a sore; what virtue, then, must there be in human fat, with the solemn mysteries of the grave about it!

In early stages of society, women are the doctors; while the men fight and hunt, the women gather herbs and decoct salves for their wounds; and the art would naturally become a sort of profession in the hands of the older women who had a reputation for superior skill of that kind. Mostly a blind groping—a mystery to themselves as well as others—their operations were looked upon with awe. The 'wise woman' with her kettle, cooking her mysterious broth, adding ingredient after ingredient (for the more, the rarer, the horribler they were, would not the compound be the more efficacious?), inspiring not only hope but fear; for the art might be and doubtless was, used to hurt as well as to heal. Roman matrons were often accused and convicted of poisoning by their decoctions; and during seasons of pestilence, these female druggists were persecuted with indiscriminate fury, as were witches afterwards in Europe. So much was the notion of poisoning uppermost in the Roman mind respecting

them, that *venefica*, literally, 'a poison-maker,' was the general name for a preparer of magic medicines, an enchantress or sorceress—the corresponding character to our witch. See WITCHCRAFT.

The operation of magical medicines was not, as is the case with those of the modern pharmacopœia, confined to physical effects on living bodies to which they were applied; associated with incantations and other ceremonies, as they always were, they could be made to produce almost any desired effect—raise or lay storms; fertilise a field, or blast it; kill or cure a man, absent as well as present; and give the power of predicting future events. How a belief in imaginary virtues of things may grow out of the experience of their real virtues, is indicated by Dr Livingstone, when speaking of the belief in rain-making among the tribes in the heart of Southern Africa. The African priest and the medicine-man is one and the same, and his chief function is to make the clouds give out rain. The preparations for this purpose are various—charcoal made of burned bats; internal parts of animals, as lions' hearts and hairy calculi from the bowels of old cows; serpents' skins and vertebrae; and every kind of tuber, bulb, root, and plant to be found in the country. 'Although you disbelieve their efficacy in charming the clouds to pour out their refreshing treasures, yet, conscious that civility is useful everywhere, you kindly state that you think they are mistaken as to their power; the rain-doctor selects a particular bulbous root, pounds it, and administers a cold infusion to a sheep, which in five minutes afterwards expires in convulsions. Part of the same bulb is converted into smoke, and ascends towards the sky; rain follows in a day or two. The inference is obvious.' The religion of this part of Africa may be characterised as medicine-worship. In a village of the Balonda, Dr Livingstone saw two pots with charms or medicines kept in a little shed, like idols in a niche. For an idol they sometimes take a piece of wood, and carve a human head on it, or simply a crooked stick, when there is no professed carver to be had; but there is nothing divine about it until it is dotted over with a mixture of medicine and red ochre. Packets of medicine are worn as charms about the person, to ward off evils of all kinds. The female chief Manenko was hung all over with such charms; and when she had to cross a river, her travelling-doctor waved medicines over her, and she took some in her hand, to save her from drowning.

During the middle ages, and down almost to the 18th c., magic was greatly studied in Europe, and could boast of distinguished names, who attempted to treat it as a grand and mysterious science, by means of which the secrets of nature could be discovered, and a certain godlike power acquired over the 'spirits' (or, as we should now say, the 'forces') of the elements. The principal students and professors of magic during the period referred to, were Pope Sylvester II., Albertus Magnus, Roger Bacon, Raymond Lully, Pico della Mirandola, Paracelsus, Cornelius Agrippa, Trithemius, Van Helmont, and Jerome Cardan.—See Horst's *Von der Alten und Neuen Magic, Ursprung, Idee, Umfang und Geschichte* (Mentz, 1820); and Ennenmeyer's *Geschichte der Magic* (2d ed. Leip. 1844; translated into English by W. Howitt, 2 vols. Lond. 1854). For an interesting account of the discipline and ceremonies of the 'art,' consult the *Dogme et Ruel de la Haute Magic* (2 vols. Paris, 1856), by Eliphas Levi—one of its latest adherents.

Some of the different forms which the belief in magic has assumed will be seen under AMULET, ACCURSES AND AUSPICES, DIVINATION, INCANTA-

TION, and WITCHCRAFT, and the allied subjects of ALCHEMY and ASTROLOGY.

MAGIC LANTERN, an optical instrument by means of which magnified images of small pictures are thrown upon a wall or screen. The instrument consists of a lantern containing a powerful argand lamp; in the side of the lantern is inserted a horizontal tube, on a level with the flame, and the light is made to pass through the tube by reflection from a concave mirror placed on the opposite side of the lantern. The tube is furnished with two lenses, one at each end; the inner one is a hemispherical illuminating lens of short focus, to condense a strong light on the picture, which is inserted into the tube, between the lenses, through a transverse slit. The other end of the tube is fitted with a double convex lens, which receives the rays after passing through the picture, and throws them upon the screen or wall. The pictures are formed with transparent varnish on glass slides, and must be inserted into the tube in an inverted position, in order that the images may appear erect. If the screen on which the image is thrown be at too great a distance, the image will become indistinct from the lessened intensity of the light, and distorted by the increasing spherical and chromatic aberration, though this latter defect may be obviated by the use of a screen of the same curvature as the outside surface of the lens. This instrument is generally used as a toy, but is also occasionally employed to produce enlarged representations of astronomical diagrams, so that they may be well seen by an audience. Phantasmagoria, dissolving views, &c., are produced by a particular manipulation of the same instrument.

MAGIC SQUARES, a species of puzzle which occupied the attention of many celebrated mathematicians from the earliest times down to the 18th century. The magic square is a square divided by lines parallel to the sides into a number of smaller equal squares or cells, in which are inserted numbers which form the terms of one or more progressions (generally arithmetical), in such an order that each line of numbers, whether added horizontally, vertically, or diagonally, shall amount to the same sum. This arrangement is effected in three different ways, according to the number of cells in the side of each square, and can be most easily effected when this number is *odd*, or *evenly even* (divisible by 4), but becomes a problem of considerable difficulty when the number of cells is *oddly even* (divisible by 2, and not by 4). The following are examples of the first two methods:

13	8	2	16
12	6	7	9
8	10	11	5
1	15	14	4

9	2	25	18	11
8	21	19	13	10
22	20	12	6	4
16	14	7	5	23
15	8	1	24	17

The arrangement for the oddly even squares is the same as that for the evenly even ones, with the exception of a few transpositions. The only exception is when the number of squares or cells is four. Dr Franklin invented a similar puzzle to this, called the 'magic circle.' See *Hutton's Recreations in Mathematical Science*, vol. i.

MAGILP, or MEGGELLUP, a composition used by artists in oil-colours as a vehicle for their 'glazes.' It is made of linseed oil and mastic varnish, and is thinned with turpentine as required for the painting.

MAGILUS, a very curious genus of gasteropodous mollusca, of the order *Tubulibranchiata*, inhabiting the Red Sea and the Indian Ocean. They have, at first, shells of the ordinary form of spiral univalves, and establish themselves in little hollows of madrepores, where they remain, enlarging

for its future care and extension; it is now a free library, and bears the name of its collector.

MAGNA CHARTA, the Great Charter which was granted by King John of England to the barons, and has been viewed by after-ages as the basis of English liberties. The oppressions and exactions of a tyrannical and dastardly sovereign called into existence a confederacy of the barons or tenants-in-chief of the crown, who took up arms for the redress of their grievances. Their demand was for the restoration of the laws of Henry I.; laws which might probably be characterized as an engraving of Norman feudalism on the 'ancient custom of England,' or previously existing Saxon and Danish free institutions, in which 'ancient custom' was comprehended the laws of Edward the Confessor. A conference between the sovereign and the barons was held at Runnymede, near Windsor, a place where treaties regarding the peace of the kingdom had often before been made. King and barons encamped opposite each other; and after several days' debate, John signed and sealed the charter with great solemnity on June 6, 1215.

The Great Charter reared up a barrier against the abuse of the royal prerogative by a series of provisions for the protection of the rights and obligations of the feudal proprietor. It redressed a variety of grievances connected with feudal tenures, some of them now so long obsolete as to be with difficulty intelligible. There are minute provisions regarding the relief of heirs, wardship, marriage of heirs and of their widows. No scutage or aid is to be imposed without the authority of the common council of the kingdom, except on the three great feudal occasions of the king's captivity, the knighting of his eldest son, and the marriage of his eldest daughter. The liberties of the city of London, and other towns, burghs, and ports, are declared inviolable. Freedom of commerce is guaranteed to foreign merchants. Justice is no longer to be sold, denied, or delayed. The Court of Common Pleas, instead of, as formerly, following the king's person in all his progresses, is to be permanently fixed at Westminster; assizes are to be held in the several counties, and assize circuits are established. Regulations are made for the efficiency of the inferior courts of justice. The protection of life, liberty, and property from arbitrary spoliation is the most important feature of the charter. 'No freeman shall be taken or imprisoned, or be disseised of his freehold, or liberties, or free customs, or be otherwise damaged, nor will we pass upon him, nor send upon him, out by lawful judgment of his peers, or by the law of the land'—a provision which recognized a popular tribunal as a check on the official judges, and may be looked on as the foundation of the writ of Habeas Corpus. No one is to be condemned on rumour or suspicions, but only on the evidence of witnesses. Protection is afforded against excessive amercements, illegal distresses, and various processes for debts and services due to the crown. The fines imposed are in all cases to be proportioned to the magnitude of the offence, and even the villen or rustic is not to be deprived of his necessary chattels. There are provisions regarding the forfeiture of lands for felony. The testamentary power of the subject is recognised over part of his personal estate, and the rest is to be divided between his widow and children. The independence of the church is also provided for.

These are the most important features of that Charter which occupies so conspicuous a place in history, and which establishes the supremacy of the law of England over the will of the monarch. A charter was at the same time granted to mitigate the oppressions of the Forest Laws (q. v.). The

Shell of Magilus.

the shell into a long tube as the madrepora grows, and thus preventing themselves from being shut in. The tube is sometimes three feet long, and the animal dwells entirely the spiral part of the shell, and lives in the mouth of the tube, which it closes against danger by an operculum, the upper part being wholly or partially filled up with solid matter.

MAGISTRATE. See JUSTICE OF PEACE.

MAGLIABECCHI, ANTONIO DA MARCO, an Italian scholar of extraordinary attainments, and court librarian, born at Florence in 1633, of a respectable but indigent family. From his earliest years, he displayed an inordinate passion for the acquisition of book-knowledge. Having speedily mastered the Greek, Latin, and Hebrew languages, he literally entombed himself among books, of which disorderly piles encumbered every portion of his dwelling, and lay in a heterogeneous litter around his feet. In his daily habits, M. grew regardless of the requirements of social and sanitary life; and such was his avidity of study, that he finally denied himself even the requisite intervals of repose. His memory was prodigious, and not only enabled him minutely to retain the contents of his multitudinous books, but also to supply, on occasion, the most exact reference to any particular page or paragraph, the place of each book being indicated with precision in the midst of their apparent inextricable masses. M. was regarded as the literary prodigy of his times. He was appointed court-librarian by the Grand Duke of Florence; and the many tributes of respect tendered by royal and distinguished personages to his wonderful erudition, fostered in an inordinate degree his love of fame and praise, which rendered him intolerant of literary merit in others, and involved him in several bitter literary squabbles. He died at Florence on 12th July 1714, in the 81st year of his age, leaving no written record of his immense encyclopedic knowledge. His valuable library of 30,000 vols. he bequeathed to his native city of Florence, with funds

terms dictated by the barons to John included the surrender of London to their charge, and the Tower to the custody of the primate till the 15th of August following, or till the execution of the several articles of the Great Charter. Twenty-five barons, as conservators of the public liberties, were invested with extraordinary authority, which empowered them to make war against the sovereign in case of his violation of the Charter. Several solemn ratifications were required by the barons both from John and from Henry III.; and a copy of the Great Charter was sent to every cathedral, and ordered to be read publicly twice a year. The copy preserved in Lincoln Cathedral is regarded as the most accurate and complete; and a fac-simile of it was engraved by order of the late Board of Commissioners on the public records. The Great Charter and Charter of the Forests are printed with English translations, and prefixed to the edition of the Statutes of the Realm published by the Record Commission.

MAGNA GRÆCIA (Gr. *Hē Megalē Hellas*), the name given in ancient times to that part of Southern Italy which was thickly planted with Greek colonies. When it first obtained this appellation, is unknown, but it must have been at an early period. Polybius says it was so called in the time of Pythagoras. Some writers include under the term the Greek cities in Sicily; others restrict it to those situated on the Gulf of Tarentum, but in general it is used to denote all the Greek cities in the south of Italy, exclusive of those in Sicily. The oldest settlement is believed to have been *Cuma*—though it is doubtful whether it and its colonies, *Dicaarchia* and *Naxos*, were really embraced under the designation M. G.; while the period assigned to its foundation—viz., soon after the Trojan war—is obviously fanciful. If we fix about the 8th or 9th c. before Christ, we will perhaps not be far wrong. Of the other Greek settlements in Italy—most, if not all of which were later than those in Sicily—the earliest was Sybaris (founded by the Achæans, 720 a.c.); next, Croton (by the Achæans, 710 a.c.); then Tarentum (by the Spartans, 708 a.c.), Locri (by the Locrians, 708 a.c., according to others, thirty or forty years later), Rhegium (by the Chalcidians; date of origin not known, but believed by some to be older than even Sybaris), Metapontum (by the Achæans, 700–680 a.c.), and Velia (by the Phocæans, 640 a.c.). These cities became, in their turn, the parents of many others.

Of the earlier history of M. G., we know almost nothing. The settlements appear to have risen rapidly to power and wealth, partly by the brisk commerce which they carried on with the mother-country, and partly also, it is conjectured, by an amalgamation with the Pelægic (and therefore kindred) natives of the interior. This, we are told by Polybius, actually happened at Locri, and most probably elsewhere also. About the year 530 a.c., Pythagoras the philosopher arrived at Crotona, and soon acquired an influence in M. G. which was quite wonderful, though it did not last long. The quarrels between the different cities were often bitter and bloody; and finally, 272–271 a.c., the Romans conquered the whole of Lower Italy. Long before this, several of the cities had disappeared. Sybaris, for example, was destroyed by the Crotonians as early as 510 a.c., and now the rest more or less rapidly sunk into decay, and were, in the time of Cæsar, with a few exceptions, reduced to utter ruin.

MAGNESIA. See **MAGNESIUM**.

MAGNESIAN LIMESTONE. See **DOLOMITE**.

MAGNESIUM (symb. Mg, equiv. 12, sp. gr. 1.74) is placed by most chemists with those metals whose

oxides form the alkaline earths (berylla, strontia, lime), but in many respects it more closely resembles zinc. It is a malleable ductile metal, of the colour and brilliancy of silver. It fuses at about the melting-point of tin (about 442°), and at an extreme heat it may be distilled like zinc. When ignited in dry air or in oxygen gas, it burns with extraordinary brilliancy, and is oxidised into magnesia. In dry air, it undergoes little change, and is much less oxidisable than the other metals of the same group. It does not decompose cold water; but if the water be heated to about 90°, there is a slight evolution of hydrogen; and if the temperature is raised to 212°, hydrogen is given off rapidly and abundantly. When thrown into strong hydrochloric acid, it inflames and becomes converted into chloride of magnesium, while hydrogen is given off.

It is obtained from its chloride either by the action of sodium or potassium, or by simple electrolytic decomposition; but the ordinary processes are difficult, and yield the metal only in minute quantities. A patent has, however, just been taken out by Mr Sonstadt for improvements in its manufacture, by which it can be produced by the pound.

Magnesia (MgO) is the only oxide of magnesium. It is a white bulky powder, devoid of taste or smell, and having a sp. gr. of 3.65; it is infusible, and almost insoluble in water; and when placed on moistened test-paper, is seen to have an alkaline reaction. When mixed with water, it gradually forms a hydrate (MgO.HO), without, as in the case of lime, any sensible elevation of heat, and this hydrate slowly absorbs carbonic acid from the atmosphere. Magnesia does not occur native, and is usually obtained by the prolonged application of heat to the carbonate. Hydrate of magnesia occurs naturally in a crystalline form in the mineral Brucite.

Magnesia Alba, the common white magnesia of commerce, is a mixture of the hydrate of magnesia and of hydrated carbonate. It is obtained by the precipitation of a hot solution of sulphate of magnesia by a hot solution of carbonate of potash or soda, and by then collecting and drying the deposit.

Of the *magnesian salts*, some are soluble, and some insoluble in water. The soluble salts have a peculiar and very bitter taste, and hence the German name, *Bittererde* (bitter-earth) for magnesia. All the salts which are insoluble in water, except the silicate, dissolve in hydrochloric and nitric acids.

Carbonate of Magnesia occurs native in the mineral *magnesite*, and in association with carbonate of lime in *dolomite*, from which it may be manufactured in a very pure state by Mr Pattinson's process, which consists essentially in the following steps. Finely ground dolomite is exposed for some time to a red heat, by which the carbonate of magnesia is decomposed; the powder is then introduced into a very strong vessel, where it is mixed with water, and carbonic acid gas forced in under heavy pressure till it ceases to be absorbed; the carbonate of magnesia becomes dissolved as bicarbonate, while the carbonate of lime remains unchanged; on boiling the clear liquid, carbonate of magnesia is deposited, and carbonic acid expelled.

Sulphate of Magnesia, or *Epsom Salts* (MgO.SO₄ + 7Aq.), is the most important of the magnesian salts. It is obtained from sea-water, or from magnesian limestone (dolomite), or from the mother-liquor of alum-works, by processes into which we have not space to enter, and is a common ingredient in mineral waters (see **EPSOM SALT**). It is soluble in three times its weight of water at 60°, and in less water at a higher temperature, the solution having a bitter, disagreeable taste.

Nitrate of Magnesia (MgO.NO₃ + 6Aq) occurs in

certain mineral waters, but is of no special importance.

A *Phosphate of Magnesia*, having the formula $\text{HO}, 2\text{MgO}, \text{PO}_3 + 14\text{Aq}$, is obtained by the mixture of solutions of sulphate of magnesia and of ordinary phosphate of soda. It occurs either in an amorphous state or in six-sided prisms, according as the solutions are more or less concentrated. This salt is a constituent of the seeds of wheat and the other cereals, of bones, and of various morbid concretions. The *Phosphate of Ammonia and Magnesia*, known also as *Ammoniac-magnesian Phosphate* and as *Triple Phosphate* ($\text{NH}_4\text{O}, 2\text{MgO}, \text{PO}_3 + 12\text{Aq}$), is a more important salt than the preceding. It occurs either in minute crystalline grains, or in beautiful transparent four-sided prisms of considerable size, and with a very characteristic appearance. The formation of the salt, which is only slightly soluble in pure water, and is quite insoluble in water containing free ammonia or its hydrochlorate, not only furnishes a very delicate test for the presence of magnesia, but enables us to determine its quantity.

This phosphate of ammonia and magnesia is readily formed by mixing a solution of a magnesian salt with hydrochlorate of ammonia, phosphate of soda, and a little free ammonia. It is an occasional constituent of urinary calculi, and crystallises in beautiful prisms from urine and other animal fluids, when they begin to putrefy. It is also frequently present in the excrements in cases of diarrhoea.

The *silicates of magnesia* are numerous. A large number of minerals are formed either wholly or partly of them, among which may be mentioned Olivine or Chrysolite, Talc, Steatite or Soapstone, Meerschaum, Serpentine, Augite, Hornblende, &c.

The haloid salts of magnesium—the chloride, iodide, and bromide—are of no special interest, except that the chloride of magnesium is, next to chloride of sodium, the most abundant of the salts existing in sea-water.

The compounds of magnesium employed in medicine are magnesia, its carbonate and its sulphate.

Magnesia is presented in small doses (from ten grains to a scruple), as an antacid, in cases of undue acidity of the stomach, heartburn, and abnormal acidity of the urine; in larger doses (from a scruple to a drachm), it produces distinct purgative effects. It is useful, especially when combined with rhubarb and a little ginger (in the form of Compound Rhubarb Powder or Gregory's Mixture), as a purgative for children, in acid conditions of the alimentary canal.

Carbonate of magnesia (magnesia alba) acts in the same manner as magnesia, except that it is less active, since more than half of it consists of water and carbonic acid. Dinneford's Solution of Magnesia, and other fluid preparations of the same nature, are made by dissolving this salt in water charged with carbonic acid. A drachm of carbonate of magnesia, the juice of one lemon, and a wine-glassful of water, constitute an agreeable laxative, a citrate of magnesia being thus formed.

Sulphate of magnesia is a purgative in very general use. It is much employed in febrile affections, and when the portal system is congested; but it may be used in almost any case in which a mild but efficient laxative is required. Its dose varies from two to four or six drachms. In combination with the infusion of senna, it forms the ordinary *Black Draught*.

MAGNETISM (said to be derived from the city Magnesia, where the loadstone was first discovered) is the power which the magnet has to attract iron. Under 'Diamagnetism' it is stated that every substance is more or less affected by the magnet, but as iron is *par excellence* magnetic, the term is chiefly used with reference to it. Magnets are of two kinds,

natural and artificial. Natural magnets consist of the ore of iron called magnetic, familiarly known as loadstone. Artificial magnets are, for the most part, straight or bent bars of tempered steel, which have been magnetised by the action of other magnets, or of the galvanic current.

Polarity of the Magnet.—The power of the magnet to attract iron is by no means equal throughout its length. If a small iron ball be suspended by a thread, and a magnet (fig. 1) be passed along in front of it from one end to the other, it is powerfully attracted at the ends, but not at all in the middle, the magnetic force increasing with the distance from the middle of the bar. The ends of the magnet where the attractive power is greatest are called its poles. By causing a magnetic needle moving horizontally to vibrate in front of the different parts of a magnet placed vertically, and counting the number of vibrations, the rate of increase of the magnetic intensity may be exactly found. Fig. 2 gives a graphic view of this increase. NS is the magnet; the lines *aN*,

Fig. 1.

Fig. 2.

aN, &c., represents the magnetic intensities at the points N, *a*, &c., of the magnet; and the curve of magnetic intensity, *N₀M₀a₀n₀*, is the line formed by the extremities of all the upright lines. It will be seen from the figure that the force of both halves, taking M as the dividing-point, is disposed in exactly the same way, that for some distance on either side of the middle or neutral point there is an absence of force, and that its intensity increases with great rapidity towards the ends. The centres of gravity of the areas *MN₀n₀* and *MS₀s₀* are the poles of the magnet, which must therefore be situated near, but not at the extremities.

A magnet has, then, two poles or centres of magnetic force, each having an equal power of attracting iron. This is the only property, however, which they possess in common, for when the poles of one magnet are made to act on those of another, a striking dissimilarity is brought to light. To shew this, let us suspend a magnet, NS, fig. 3, by a band of paper, M, hanging from a cocoon thread (a thread without torsion). When the magnet is left to itself, it takes up a fixed position, one end keeping north, and the other south. The north pole cannot be made to stand as a south pole, and vice versa; for when the

Fig. 3.

MAGNETISM.

magnet is disturbed, both poles return to their original positions. Here, then, is a striking dissimilarity in the poles, by means of which we are enabled to distinguish them as *north pole* and *south pole*. When thus suspended, let us now try the effect of another magnet upon it, and we shall find that the pole of the suspended magnet that is attracted by one of the poles of the second magnet is repelled by the other, and *vice versa*; and where the one pole attracts, the other repels. If, now, the second magnet be hung like the first, it will be found that the pole which attracted the north pole of the first magnet is a south pole, and that the pole which repelled it is a north pole. We thus learn, that each magnet has two poles, the one a north, and the other a south pole, alike in their power of attracting soft iron, but differing in their action on the poles of another magnet, like poles repelling, and unlike poles attracting, each other.

It might be thought that, by dividing a magnet at its centre, the two poles could be insulated, the one half containing all the north polar magnetism, and the other the south. When this is done, however, both halves become separate magnets, with two poles in each—the original north and south poles standing in the same relation to the other two poles called into existence by the separation. We can therefore never have one kind of magnetism without having it associated in the same magnet with the same amount of the opposite magnetism. It is this double manifestation of force which constitutes the polarity of the magnet.

The fact of the freely suspended magnet taking up a fixed position, has led to the theory, that the earth itself is a huge magnet, having its north and south magnetic poles in the neighbourhood of the poles of the axis of rotation, and that the magnetic needle or suspended magnet turns to them as it does to those of a neighbouring magnet. All the manifestations of terrestrial magnetism give decided confirmation of this theory. It is on this view that the French call the north pole of the magnet the south pole (*pôle austral*), and the south the north pole (*pôle boréal*); for if the earth be taken as the standard, its north magnetic pole must attract the south pole of other magnets, and *vice versa*. In England and Germany, the north pole of a magnet is the one which, when freely suspended, points to the north, and no reference is made to its relation to the magnetism of the earth.

Form of Magnets.—Artificial magnets are either bar-magnets or horseshoe-magnets. When powerful magnets are to be made, several thin bars are placed side by side with their poles lying in the same way. They end in a piece of iron, to which they are bound by a brass screw or frame. Three or four of these may be put up into the bundle, and these again into bundles of three and four (fig. 4). Such a

Fig. 4.

collection of magnets is called a *magnetic magazine* or *battery*. A magnet of this kind is more powerful than a solid one of the same weight and size, because thin bars can be more strongly and regularly magnetised than thick ones. Fig. 7 is a horseshoe-magnetic magazine. The central lamina protrudes slightly beyond the other, and it is to it that the armature is attached, the whole action of the magnet being concentrated on the projection. A natural magnet is shown in fig. 5. It is a parallelepiped of magnetic iron ore, with pieces of soft iron, NN and

SS, bound to its poles by a brass frame encircling the whole. The lower ends of the soft iron bars act as the poles, and support the armature, A. The

Fig. 5.

magnetic needle is a small magnet nicely balanced on a fine point. See COMPASS.

Magnetic Induction.—When a short bar of soft iron, *ns* (fig. 6), is suspended from one end S of the magnet NS, it becomes for the time powerfully magnetic. It assumes a north and south pole, like

Fig. 6.

a regular magnet, as may be seen by using a small magnetic needle; and if its lower end, *s*, be dipped into iron filings, it attracts them as a magnet would do. When it is taken away from NS, the filings fall off, and all trace of magnetism disappears. It need not be in actual contact to shew magnetic properties; when it is simply brought near, the same thing is seen, though to a less extent. If the inducing magnet be strong enough, the induced magnet, *ns*, when in contact, can induce a bar like itself, placed at its extremity, to become a magnet; and this second induced magnet may transmit the magnetism to a third, and so on, the action being, however, weaker each time. If a steel bar be used for this experiment, a singular difference is observed in its action; it is only after some time that it begins to exhibit magnetic properties, and, when exhibited, they are feebler than in the soft iron bar. When the steel bar is removed, it does not part instantly with its magnetism, as the soft iron bar, but retains it permanently. Steel, therefore, has a force which, in the first instance, resists the assumption of magnetism; and, when assumed, resists its withdrawal. This is called the *coercitive force*. The harder the temper of the steel, the more is the coercitive force developed in it. It is this force also, in the load-stone, which enables it to retain its magnetism.

Fig. 7.

Magnetisation. By Single Touch (*Fr. simple touche, Ger. einfacher Strich*).—The steel bar to be magnetised

is laid on a table, and the pole of a powerful magnet is rubbed a few times along its length, always in the same direction. If the magnetising pole be north, the end of the bar it first touches each time becomes also north, and the one where it is lifted south. The same thing may be done by putting, say, the north magnetising pole first on the middle of the bar, then giving it a few passes from the middle to the end, returning always in an arch from the end to the middle. After doing the same

Fig. 8.

to the other half with the south pole, the magnetisation is complete. The first end rubbed becomes the south, and the other the north pole of the new magnet.—By *Divided Touch* (Fr. *touché séparé*, Ger. *getrennter Strich*).—This method is shown in fig. 8. The bar *as* to be magnetised is placed on a piece of wood *W*, with its ends abutting on the extremities of two powerful magnets *NS* and *SN*. Two rubbing magnets are placed with their poles together on the middle of *as*, inclined at an angle rather less than

Fig. 9.

30° with it. They are then simultaneously moved away from each other to the ends of *as*, and brought back in an arch again to the middle. After this is repeated a few times, the bar *as* is fully magnetised. The disposition of the poles is shown in the figure by the letters *N* or *s*, meaning a north, and *S* or *a*, a south pole. This method communicates a very regular magnetism, and is employed for magnetic needles, or where accuracy is needed.—The magnetisation by *Double Touch* is of less practical importance, and need not here be described. It communicates a powerful, but sometimes irregular magnetism, giving rise to *consecutive poles*—that is, to more poles than two in the magnet.

Fig. 10.

For horseshoe-magnets, Hoffer's method is generally followed. The inducing magnet (fig. 9) is placed vertically on the magnet to be formed, and moved from the ends to the bend, or in the opposite way, and brought round again, in

an arch, to the starting-point. A soft iron armature is placed at the poles of the induced magnet. That the operation may succeed well, it is necessary for both magnets to be of the same width. The same method may also be followed for magnetising bars. The bars (fig. 10) *NS* and *N'S'*, with the armatures *ab* and *cd*, are placed so as to form a rectangle; and the horseshoe-magnet is made to glide along both in the way just described.

Magnetisation by the Earth.—The inductive action of terrestrial magnetism is a striking proof of the truth of the theory already referred to, that the earth itself is a magnet. When a steel rod is held in a position parallel to the Dipping-needle (q. v.), it becomes, in the course of time, permanently magnetic. This result is reached sooner when the bar is rubbed with a piece of soft iron. A bar of soft iron held in the same position is more powerfully but only temporarily affected, and when reversed, the poles are not reversed with the bar, but remain as before. If when so held it receives at its end a few sharp blows of a hammer, the magnetism is rendered permanent, and now the poles are reversed when the bar is reversed. The torsion caused by the blows of the hammer appears to communicate to the bar a coercitive force. We may understand from this how the tools in workshops are generally magnetic. Whenever large masses of iron are stationary for any length of time, they are sure to give evidence of magnetisation, and it is to the inductive action of the earth's poles acting through ages that the magnetism of the loadstone is to be attributed.

Preservation and Power of Magnets.—Magnets, when freshly magnetised, are sometimes more powerful than they afterwards become. In that case, they gradually fall off in strength, till they reach a point at which their strength remains constant. This is called the *point of saturation*. If a magnet has not been raised to this point, it will lose nothing after magnetisation. We may ascertain whether a magnet is at saturation by magnetising it with a more powerful magnet, and seeing whether it retains more magnetism than before. The saturation point depends on the coercitive force of the magnet, and not on the power of the magnet with which it is rubbed. When a magnet is above saturation, it is soon reduced to it by repeatedly drawing away the armature from it. After reaching this point, magnets will keep the same strength for years together if not subjected to rough usage. It is favourable for the preservation of magnets that they be provided with an armature or keeper. For further information, see article ARMATURE. The power of a horseshoe-magnet is usually tested by the weight its armature can bear without breaking away from the magnet. Hüller gives the following formula for this weight: $W = a^2/m$; W is the charge expressed in pounds; a , a constant to be ascertained for a particular quality of steel; and m is the weight in pounds of the magnet. He found, in the magnets that he constructed, a to be 126. According to this value, a magnet weighing 2 oz. sustains a weight of 3 lbs. 2 oz., or 25 times its own weight; whereas a magnet of 100 lbs. sustains only 271 lbs., or rather less than 3 times its own weight. Small magnets, therefore, are stronger for their size than large ones. The reason of this may be thus explained. Two magnets of the same size and power, acting separately, support twice the weight that one of them does; but if the two be joined, so as to form one magnet, they do not sustain the double, for the two magnets being in close proximity, act inductively on each other, and so lessen the conjoint power. Similarly, several magnets made up into a battery have not a force proportionate to their number. Large magnets in the

MAGNETISM.

same way may be considered as made up of several laminae, interfering mutually with each other, and rendering the action of the whole very much less than the sum of the powers of each. The best method of ascertaining the strength of bar-magnets is to cause a magnetic needle to oscillate at a given distance from one of their poles, the axis of the needle and the pole of the magnet being in the magnetic meridian. These oscillations observe the law of pendulum motion, so that the force tending to bring the needle to rest is proportionate to the square of the number of oscillations in a stated time.

Action of Magnets on each other.—Coulomb discovered, by the oscillation of the magnetic needle in the presence of magnets in the way just described, that *when magnets are so placed that two adjoining poles may act on each other without the interference of the opposite poles*, that is, when the magnets are large compared with the distance between their centres, *their attractive or repulsive force varies inversely as the square of the distance*. Gauss proved from this theoretically, and exhibited experimentally, that when the distance between the centres of two magnets is large compared with the size of the magnets, that is, *when the action of both poles comes into play, their action on each other varies inversely as the cube of the distance*.

Effect of Heat on Magnets.—When a magnet is heated to redness, it loses permanently every trace of magnetism; iron, also, at a red heat, ceases to be attracted by the magnet. At temperatures below red heat, the magnet parts with some of its power, the loss increasing with the temperature. The temperatures at which other substances affected by the magnet lose their magnetism differ from that of iron. Cobalt remains magnetic at the highest temperatures, and nickel loses this property at 662° F.

Ampere's Theory of Magnetism.—This theory forms the link between magnetism and galvanic electricity, and gives a simple explanation of the phenomena of electro-magnetism and magneto-electricity. We shall therefore preface the short discussion of these two subjects by a reference to it. Ampere considers that every particle of a magnet has closed currents circulating about it in the same direction. A section of a magnet according to this theory is shown in fig. 11. All the separate currents in the various particles may, however, be considered

Fig. 11.

Fig. 12.

to be equivalent to one strong current circulating round the whole (fig. 12). We are to look upon a magnet, then, as a system, so to speak, of rings or rectangles, placed side by side, so as to form a cylinder or prism, in each of which a current in the same direction is circulating. Before magnetisation, the currents run in different directions, so that their effect as a system is lost, and the effect of induction is to bring them to run in the same direction. The perfection of magnetisation is to render the various currents parallel to each other. Soft iron, in consequence of its offering no resistance to such a disposition, becomes more powerfully magnetic under

induction than steel, where such resistance exists. Experiment very strongly confirms the truth of this theory. Helices of copper-wire, in which a current is made to circulate, manifest all the properties of a magnet. Such are shown, in skeleton, in figs. 13 and 14. Each convolution of the spiral

Fig. 13.

may be taken as a substitute for one of the rings above spoken of. In helix (fig. 13), the current, after entering, goes from right to left (contrary to the hands of a watch), and it is hence called left-handed; in fig. 14, it goes with the hands of a

Fig. 14.

watch, and is right-handed. The extremities of both helices act on the magnetic needle like the poles of a magnet while the current passes. The poles are shown by the letters N and S, and this can be easily deduced from Ampere's rule (see GALVANISM), for, suppose the little figure of a man to be placed in any part of the helix (fig. 13), so that, while he looks towards the axis of the helix, the current enters by his feet, and leaves by his head, the north pole will be at his left hand, as shown in the figure. In the left-handed helix (fig. 14), the poles are reversed according to the same rule. If either of these helices be hung so as to be capable of horizontal motion, which, by a simple construction, can easily be done, as soon as the current is established, the north and south poles place themselves exactly as those of the magnetic needle would do; or, if they were hung so as to be able to move vertically in the magnetic meridian, they would take up the position of the Dipping-needle (q. v.).

These movements can be still further explained by reference to the mutual action of electric

Fig. 15.

currents on each other. It is found that *when two currents are free to move, they endeavour to place themselves parallel to each other, and to move in the same direction*, and that *currents running in the same direction attract, and those running in opposite directions, repel*. The apparatus fig. 15 is intended to prove this. The rectangle cdef is movable round the pins, a and b, resting on two mercury cups.

The arrangement is such that while the rectangle *cd* is movable about its axis, a current can continue steadily to flow in it. Further description is unnecessary, the diagram explaining itself. If a wire in which a current passes downwards be placed vertically near *cd*, *cd* is attracted by it; but if the current pass upwards, it is repelled, and *ef* attracted. Place, now, the wire below and parallel to *de*. If the current passes in the direction *d* to *e*, no change takes place, as the attraction cannot shew itself; but if the current moves from *e* to *d*, the whole turns round till it stands where *e* was, and both currents run the same way. If the wire be placed at right angles to *de*, the rectangle turns round and comes to rest, when both currents are parallel, and in the same direction.

According to Ampere's theory, the earth, being a magnet, has currents circulating about it, which, according to his rule, must be from east to west, the north pole of the earth being, in our way of speaking, a south pole. A magnet, then, will not come to rest till the currents moving below it place themselves parallel to and in the direction of the earth's currents. This is shown in fig. 16, where

Fig. 16.

a section of a magnet is represented in its position of rest with reference to the earth-current. The upper current being further away from the earth-current, is less affected by it, and it is the lower current that determines the position. A magnetic needle, therefore, turns towards the north to allow the currents moving below it to place themselves parallel to the earth's current. This also is shown by the rectangle in fig. 15, which comes to rest when *d* and *e* lie east and west.

Electro-magnetism includes all phenomena in which an electric current produces magnetism. The most important result of this power of the current is the electro-magnet. This consists (fig. 17) generally of a round bar of soft iron bent into the horse-shoe form, with an insulated wire coiled round its extremities. When a current passes through the coil, the soft iron bar becomes instantly magnetic, and attracts the armature with a sharp click. When the current is stopped, this power disappears as suddenly as it came.

Fig. 17.

Electro-magnets far out rival permanent magnets in strength. Small electro-magnets have been made by Joule which support 3500 times their own weight, a feat immeasurably superior to anything performed by steel magnets. When the current is of moderate strength, and the iron core more than a third of an inch in diameter, the magnetism induced is in proportion to the strength of the current and of the number of turns in the coil. When the bar is thinner than one-third of an inch, a maximum

is soon reached beyond which additional turns of the wire give no additional magnetism; and even when the core is thick, these turns must not be heaped on each other, so as to place them beyond influencing the core. It follows from the above principle, that in the horse-shoe-magnet, where the inductive action in the armature must be taken into account, that the weight which the magnet sustains is in proportion to the squares of the strengths of the currents, and to the squares of the number of turns of the wire. This maximum is in different magnets proportional to the area of section, or to the square of the diameter of the core. The electro-magnet, from the ease with which it is made to assume or lay aside its magnetism, or to reverse its poles, is of the utmost value in electrical and mechanical contrivances. The action of the electro-magnet is quite in keeping with Ampere's theory, as the current of the coil, acting on the various currents of the individual molecules, places them parallel to itself, in which condition the soft iron bar acts powerfully as a magnet. The direction of the current and the nature of the coil being known, the poles are easily determined by Ampere's rule.

Electro-magnetic Machines.—These take advantage of the facility with which the poles of an electro-magnet may be reversed, by which attractions and repulsions may be so arranged with another magnet as to produce a constant rotation. The forms in which they occur are exceedingly various, but the description of the apparatus in fig. 18 will suffice to illustrate their principle of working. *NS* is a fixed permanent magnet (it could be equally well an electro-magnet); the electro-magnet, *ae*, is fixed to the axis *ce*, and the ends of the coil are soldered

Fig. 18.

to the ring *c*, encircling a projection on the axis. The ring has two slits in it, dividing it into two halves, and filled with a non-conducting material, so that the halves are insulated from each other. Pressing on this broken ring, on opposite sides, are two springs, *a* and *b*, which proceed from the two binding-screws into which the wires, *+* and *-*, from the battery are fixed. In the position shown in the figure, the current is supposed to pass along *a*, to the half of the ring in connection with the end *f*, of the coil, to go through the coil, to pass by *g* to the other half of the ring, and to pass along *b*, in its return to the battery. The magnetism induced by the current in the electro-magnet, makes *a* a south, and *s* a north pole, by virtue of which *N* attracts *a*.

MAGNETISM.

and S attracts *s*. By this double attraction, *ns* is brought into a line with NS, where it would remain, did not just then the springs pass to the other halves of the ring, and reverse the current, making *s* a north, and *n* a south pole. Repulsion between the like poles instantly ensues, and *ns* is driven onwards through a quarter revolution, and then attraction as before between unlike poles takes it through another quarter, to place it once more axially. A perpetual rotation is in this way kept up. The manner in which a constant rotary motion may be obtained by electro-magnetism being understood, it is easy to conceive how it may be adapted to the discharge of regular work. Powerful machines of this kind have been made with a view to supplant the steam-engine; but such attempts, both in respect of economy and constancy, have proved utter failures.

Magneto-electricity includes all phenomena where magnetism gives rise to electricity. Under Induction of Electric Currents (q. v.), it is stated that when a coil in which a current circulates, is quickly placed within another coil unconnected with it, a contrary induced current in the outer coil marks its entrance, and when it is withdrawn, a direct induced current attends its withdrawal. While the primary coil remains stationary in the secondary coil, though the current continues to flow steadily in the primary, no current is induced in the secondary coil. It is also shewn, that if, while the primary coil is stationary, the strength of its current be increased or diminished, each increase and diminution induces opposite currents in the secondary coil. Change, in fact, whether in the position or current strength of the primary coil, induces currents in the secondary coil, and the intensity of the induced current is in proportion to the amount and suddenness of the change. In singular confirmation of Ampere's theory, a permanent bar-magnet may be substituted for the primary coil in these experiments, and the same results obtained with greater intensity. When a bar-magnet is introduced into the secondary coil, a current is indicated, and when it is withdrawn, a current in a contrary direction is observed, and these currents take place in the directions required by Ampere's theory. A change of position of the magnet is marked by a current, as in the former case. If we had the means of increasing or lessening the magnetism of the bar, currents would be induced the same as those obtained by strengthening

or weakening the current in the primary coil. It is this inductive power of iron at the moment that a change takes place in its magnetism, that forms the basis of magneto-electric machines. The manner in which this is taken advantage of, will be easily understood by reference to fig. 19. NS is a permanent horseshoe-magnet, and let us suppose it to be fixed; CD is a bar of soft iron, with coils A and B wound round its extremities, and may

Fig. 19.

be looked upon as the armature of the magnet. CD is capable of rotation round the axis EF. So long as CD remains in the position indicated in the

figure, no currents are induced in the surrounding coils, for no change takes place in the magnetism induced in it by the action of NS. The moment that the poles of CD leave NS, the magnetism of the soft iron diminishes as its distance from NS increases; and when it stands at right angles to its former position, the magnetism has disappeared. During the first quarter-revolution, therefore, the magnetism of the soft iron diminishes, and this is attended in the coil (for both coils act, in fact, as one) by an electric current, which becomes manifest when the ends *e, e*, of the coil are joined by a conductor. During the second quarter-revolution, the magnetism of the armature increases till it reaches a maximum, when its poles are in a line with those of NS. A current also marks this increase, and proceeds in the same direction as before; for though the magnetism increases instead of diminishes, which of itself would reverse the induced current, the poles of the revolving armature, in consequence of their change of position with the poles of the permanent magnet, have also been reversed, and this double reversal leaves the current to move as before. For the second half-revolution the current also proceeds in one direction, but in the opposite way, corresponding to the reversed position of the armature. Thus, in one revolution of a soft iron armature in front of the poles of a permanent magnet two currents are induced in the coils encircling it, in opposite directions, each lasting half a revolution, starting from the line joining the poles.

Magneto-electric Machine.—The general construction of a simple magneto-electric machine is shewn in fig. 20. NS is a fixed permanent magnet. BB

Fig. 20.

is a soft iron plate, to which are attached two cylinders of soft iron, round which the coils C and D are wound. CBBD is thus the revolving armature, corresponding to CD in fig. 19. AA is a brass rod rigidly connected with the armature, and also serving as the rotating axle. F is a cylindrical projection on AA, and is pressed upon by two fork-like springs, H and K, which are also the poles of the machine. The ends, *m, n*, of the coil are soldered to two metal rings on F, insulated from each other. When the armature revolves, AA and F move with it. F, H, and K are so constructed as to act as a commutator, reversing the current at each

semi-revolution. By this arrangement, the opposite currents proceeding from the coil at each semi-revolution are transmitted to H and K in the same direction, so that these, which constitute the poles of the battery, so to speak, remain always of the same name. But for this, the effect of the current derived from one semi-revolution would be neutralised by that proceeding from the next. When the armature is made to revolve with sufficient rapidity, a very energetic and steady current is generated. Compared with the galvanic battery, the magneto-electric machine is a readier, steadier, and cleaner source of electricity, and is, in consequence, extensively used instead of it. Magneto-electric machines may be made of any strength by increasing the number of magnets and the mechanical force employed. For further information on magnetism, consult articles ARMATURE, DECLINATION NEEDLE, DIAMAGNETISM, DIPPING NEEDLE, and ROTATION, MAGNETISM OF.

MAGNIFICAT, a musical composition in the evening service of the Roman Catholic Church, and also of the Lutheran and English Churches. The words are taken from Luke i. 46—55, containing the 'song of the Virgin Mary,' which, in the Vulgate, begins with *Magnificat*. In the Roman Catholic Church, the Magnificat is a grand hymn, powerful in melody and harmony, mixed with pompous fugues, and with full instrumentation. In modern times, there have been few attempts in the Roman Catholic service to supersede the older music of the Magnificat (by Palestrina); but in the service of the Church of England, where the music is of a less elevated character, new compositions are frequently written for the Magnificat, by composers strictly of the English school.

MAGNOLIA, a genus of beautiful trees of the natural order *Magnoliaceae*, having a calyx of three sepals, a corolla of 6—12 petals, and carpels in spikes arranged in cones, and opening at the dorsal suture. They are natives chiefly of North America, the Himalaya Mountains, China, and Japan. The flowers are large and solitary; the leaves large. The wood is in general soft, spongy, and of little value. *M. grandiflora*, sometimes called the BIG LAUREL, has white flowers sometimes a foot in diameter. It is a lofty and magnificent evergreen tree, conspicuous at a great distance, found in the lower districts from North Carolina to the Gulf of Mexico. It succeeds well as an ornamental tree in the south of England, but in Scotland requires a wall and some protection in winter.—*M. tripetala* is found on the Alleghany Mountains, and extends as far north as lat. 43°. From the radiated manner in which its leaves are disposed at the extremities of the branches, it has received the name of UMBRELLA TREE. It has very large white flowers. It is one of the species most commonly cultivated in Britain, but in Scotland it requires a wall.—*M. acuminata* inhabits the same districts, and is a lofty tree with greenish-yellow flowers. It endures the climate of Britain well, but its flowers are not so much admired as those of some of its congeners.—*M. glauca*, a native of Pennsylvania, Virginia, and Carolina, is known by the names of WHITE BAY, BEAVERWOOD, and SWAMP SASSAPARILLA. It is a tree or shrub of 15—20 feet in height, with very beautiful and fragrant white flowers.—The YULAN, or Chinese *M.* (*M. Yulan* or *conspicua*), has been much cultivated in China for more than twelve hundred years, on account of its beautiful and fragrant white flowers, which it produces in great profusion. It is one of the finest ornamental trees we possess, and succeeds well in the south of England, and against a wall in Scotland. It is a deciduous tree, and the flowers

expand before the development of the leaves.—*M. excelsa*, one of the finest species known, is a predominant tree in some parts of the Himalaya Mountains, at an elevation of 7000—8000 feet, the mountains when it is in blossom appearing as sprinkled with snow.—*M. Campbellii*, another native of the same region, produces great rose-coloured flowers, and is described by Dr Hooker as the most superb of the genus.—Allied to the genus *M.* is *Nicholia*, some of the species of which are amongst the most valuable timber trees of Nepal, and very ornamental. The bark of some of them is used medicinally, and the fragrant flowers of a species called Champac are the delight of the people of Hindustan. *Manglietia* is another closely allied genus, to which belong valuable timber trees of Nepal and of the Indian islands.—The natural order *Magnoliaceae* is closely allied to *Ranunculaceae*, differing chiefly in the arborescent habit, and in the large stipules which envelop the young leaves before they open, but soon fall off. The leaves are simple. Aromatic properties are prevalent. To this order belong the Tulip Tree, Star Anise, and Winter's Bark.

MAGNUSSEN, FINN, a distinguished scholar and archaeologist, was born in 1781 at Skabholt, in Iceland, where his family, both on his mother's and father's side, had for many generations been distinguished for learning and integrity. In 1797, M. entered the university of Copenhagen with a view of studying for the law; and although he so far fulfilled the original intention of his education as to practise this profession for some years in Iceland, his strong bent towards archaeological pursuits led him, in 1812, to return to Copenhagen, where he devoted himself with much zeal to his favourite studies under the direction of his distinguished countrymen Thorkelin and Thorlacius. In 1815, he obtained a chair of literature in the university; and in 1819, at the solicitation of the Academy of Fine Arts, he gave a course of lectures on ancient northern literature and mythology. From this, or even an earlier period, to the close of his life, M. devoted himself to the elucidation of these subjects with a success that was generally commensurate with the great ability and acute learning which he brought to bear upon it, although in some few instances his zeal led him to adopt too hasty conclusions. Among his earliest and most noteworthy works are his papers on the Aboriginal Home and Earliest Migrations of the Caucasian Races (1818); his contributions to northern archaeology (1830); the indices, glossaries, and lexicon which he compiled for the elucidation of the 2d and 3d of the Arne-Magnussen editions of the *Eddas* (1816 and 1838); his comprehensive translation of the *Elldre Edda* (*Aldre Edda, oversat og forklaret*, Kopen. 1834); and his exposition of the same work (*Edda lærer og dens Opfindelse*, Kopen. 1824). Among his later works, his *Runamo* or *Runerne* (Kopen. 1841) has given rise to much angry discussion; and although many of his interpretations of assumed runes have been proved to be utterly untenable, the learning and acumen which he brought to bear on the subject of runes generally, have thrown great light on this branch of archaeology, both in regard to North American and ancient northern remains. In conjunction with Rafn, M. elucidated the history and antiquities of Greenland in an able work (*Grønland's Historiske Mindesmærker*, Kopen. 1838—1842); and he subsequently prosecuted a similar course of inquiry in regard to Russia in *Antiquités Russes* (Copen. 1850—1852). In addition to these works, M. has annotated nearly all the most important remains of old northern literature, as the *Heimskringla*, *Helgakarmal*, *Laxdæla-Saga*, &c.; and besides numerous monographs on archaeological and historic subjects

of interest, has made many valuable contributions to current Icelandic literature. During his latter years, M. sat in the Danish landthing as deputy for Iceland and the Farøe Isles, in which capacity he gave evidence of considerable political knowledge and patriotic zeal. At his death, in 1847, he held the office of *Gesindsmester* in the Royal Chamber of Archives.

MA'GO, a common Carthaginian name; no less than 14 different persons bearing it occur in history; of whom the most distinguished is M., the son of Hamilcar Barca, and a younger brother of Hannibal (q. v.) and Hasdrubal.

MAGPIE, or **PIE** (*Pica*), a genus of birds of the family *Corvidæ* (q. v.), differing from the true crows chiefly in the long and graduated tail. They are also of smaller size and brighter colours, the most prevalent colour being blue with bars of black and white.—The only British species is the **COMMON M.** (*P. caudata*), the *Kitta* of the Greeks, and *Pica* of the Romans; a common bird in Britain, and almost

Common Magpie (*Pica caudata*).

all parts of Europe, and too well known to require particular description; its bright but not finely mingled colours—black, white, and blue—making it always conspicuous, and its dissonant harsh cry equally attracting attention. The M. is generally to be seen in pairs throughout the year. It builds its nest in high trees; the outside being formed of thorny sticks strongly interwoven, the inside plastered with earth and lined with fibres and dry grass; the top a dome, and one aperture left on the side for the parent bird. The M. is shy and vigilant in an extreme degree, notable for cunning, both in eluding enemies, and in seeking its own food, as to which it may be said that nothing comes amiss to it, grain being not unacceptable, but eggs or carrion preferable. In Britain, it is persecuted by gamekeepers; in Norway, it is encouraged in the neighbourhood of human habitations, and consequently often makes its nest under the eaves of churches and other buildings. The M. is easily tamed, becomes impudently familiar, and learns to articulate a few words. Both in a wild and tame state, it has a propensity to seize and carry off bright or glittering articles. It abounds in most parts of Europe and the North of Asia, and in the northern parts of America, but is rare in the parts of America near the Atlantic.—The other species are mostly natives of the eastern parts of Asia.

MA'GYAR. See HUNGARY.

MAHĀBHĀRATA (from the Sanskrit *mahat*—changed to *mahā*—great, and *Bhārata*) is the name of one of the two great epic poems of ancient India. For the other, see the article *RĀMĀYANA*. As its main story relates to the contest between two rival families, both descendants of a king, Bharata, the word M. probably implies 'the great history of the descendants of Bharata;' for another explanation of the word, which connects it with *māra*, weight, was obviously invented merely to convey an idea of the enormous extent of this poem. According to this explanation, it would mean the 'very weighty (poem),' because, 'when weighed, it was found to be heavier than all the four Vedas together with their mystical writings.' However devoid of grammatical value this popular account of the word M. may be, it does not exaggerate the bulk of this epic, which, in its present condition, consists of upwards of one hundred thousand verses, each containing thirty-two syllables; while, if a tradition, reported in the introduction to the work itself, could be trusted, it was formerly known in other recensions of a still greater extent. In its actual shape, it is divided into eighteen parvas or books, the *Hārīśaśa* (q. v.) being considered as a supplementary part of it. That this huge composition was not the work of one single individual, but a production of successive ages, clearly results from the multifariousness of its contents, from the difference of style which characterises its various parts, and even from the contradictions which disturb its harmony. Hindu tradition ascribes it to Vyāsa; but as Vyāsa means 'the distributor or arranger,' and as the same individual is also the reputed compiler of the Vedas, Purāṇas, and several other works, it is obvious that no historical value can be assigned to this generic name. The contents of the M. may be distinguished into the leading story and the episodical matter connected with it. The former is probably founded on real events in the oldest history of India, though in the epic narrative it will be difficult to disentangle the reality from the fiction. The story comprises the contest of the celebrated families called the Kauravas and Pāṇḍavas, ending in the victory of the latter, and in the establishment of their rule over the northern part of India. Kuru, a descendant of Bharata, had two sons, Dhṛitaraṣṭra and Pāṇḍu. The sons of the former, commonly called the Kauravas, were a hundred in number, the eldest of them being Duryodhana; those of Pāṇḍu—the Pāṇḍavas—were five, Yudhishtira, Bhīma, Arjuna, and the twins Nakula and Sahadeva. Pāṇḍu having resigned his throne, Dhṛitaraṣṭra, though blind, assumed the government, and ultimately divided his kingdom between his sons and the sons of Pāṇḍu. The former, however, coveting the territory allotted to the Pāṇḍu princes, endeavoured to get possession of it. A game of dice was the means by which they bound over their cousins to relinquish their kingdom, promising, however, to restore it to them if they passed twelve years in the forests, and a thirteenth year in such disguises as to escape detection. This promise was faithfully kept by the Pāṇḍavas; but the term of their banishment having expired, the Kuru princes refused to redeem their word. A war ensued, ending in the complete destruction of the Kauravas. These are the meagre outlines of the leading story of the M., where, as may be inferred, Duryodhana and his brothers are pictured as the type of all conceivable wickedness, and the Pāṇḍu princes as paragons of virtue and heroism. That the latter are the incarnations of sundry deities—that the gods take an active part in the development of the plot, in short, that Hindu mythology is always interwoven with

these stirring events of semi-historical Hindu antiquity, requires no further remark to any one but slightly acquainted with Hindu poetry. It is necessary, however, to observe that out of the one hundred thousand verses which constitute the great epos, barely a fourth part is taken up by this narrative; all the rest is episodical. The matter thus, as it were, incidentally linked with the main story, may be distributed under three principal heads, passing over such minor additions as fables, genealogical lists, geographical enumerations, and the like. One category of such episodes comprises narratives relating to the ancient or mythical history of India, as, for instance, the episodes of Nala and Śakuntalā; a second is more strictly mythological, comprising cosmogony and theogony; a third is didactic or dogmatic—it refers to law, religion, morals, and philosophy, as in the case of the celebrated Bhagavadgītā, and the principal portions of the 12th and 13th books. By means of this episodical matter, which at various periods, and often without regard to consistency, was superadded to the original structure of the work, the M. gradually became a collection of all that was needed to be known by an educated Hindu; in fact, it became the encyclopædia of India. 'There is no narrative on earth,' the M. says of itself, 'that is not founded on this epos. . . . The twice-born, though knowing the four Vedas and their supplementary sciences, has no wisdom unless he knows this great epos. . . . It is the great manual of all that is moral, useful, and agreeable.' Yet it should be noticed that the Brahmanic authors of the great epos intended it especially as an encyclopædia for the Kshatriya or military caste; for it is chiefly the history, the interests, the religion, and the duties of the second caste which are taught in it, always, of course, with a view of establishing the superiority of the Brahmanic caste. Sectarian religion is for this reason not emphasised in the M., though the later sectarian works (see PURĀṆA) have largely drawn, for their purposes, on the mythological material afforded them by the great epic work. The text of the M. has been published in Calcutta in four quarto volumes (1834—1839), to which is added a fifth volume, containing a table of contents. Two other editions are in the course of publication at Bombay. The best researches on the M. are those by Lassen, in his *Zeitschrift für die Kunde des Morgenlandes* (1837, ff.), and in his *Indische Alterthumskunde*. A sort of analysis of the leading story of the M. (not of the episodes) has lately been given by F. G. Eichhoff (*Poésie Héroïque des Indiens*, Paris, 1860), and by Professor Monier Williams (*Indian Epic Poetry*, London, 1863).

MAHĀDEVA ('the great god') is one of the usual names by which the Hindu god Śiva is called. (His consort, Durgā, is similarly styled *Mahadevi*, 'the great goddess.') In Buddhist history, M., who lived 200 years after the death of the Buddha Śākyamuni, or 343, is a renowned teacher who caused a schism in the Buddhist Church. His adversaries accuse him of every possible crime, but as he is ranked amongst the Arhats, his eminence cannot be matter of doubt. The school founded by him is called *Pārasāyā*. See W. Wassiljew, *Der Buddhismus*, &c. (St Petersburg, 1860).

MAHĀKĀSYAPA, one of the most renowned disciples of the Buddha Śākyamuni. He arranged metaphysically the portion of the sacred writings of the Buddhists called Abhidharma; and tradition ascribes to him also the origin of the *Śthavira* division of the *Vaiśāhika* school of Buddhist philosophy. Many legends are connected with his

life.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844), and his posthumous work, *Le Lotus de la Bonne Loi* (Paris, 1852).

MAHANNUDDY (more accurately, MAHĀNUDDI), a river of India, rises on the south-west border of the presidency of Bengal, in lat. 20° 20' N., long. 82° E. After an eastward course of 520 miles, 300 miles of which are navigable, having divided into several branches at the town of Cuttack, which forms the head of its delta, it flows east and south-east through the district of that name, and falls by several mouths into the Bay of Bengal.

MAHĀSĀNGHIKA is the name of one of the two great divisions of the Buddhist Church which arose about 200 years after the death of the Buddha Śākyamuni, or about 343, caused, as it seems, by the schism of Mahādeva (q. v.). For the other division, see ŚTHĀVIRA. Out of the M. school arose in the course of the next centuries, numerous sects. For the tenets common to all, and for those peculiar to each of these sects, the special student of the Buddhist religion will at present most advantageously consult the work of Professor W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

MAHĀVANSA is the title of two celebrated works written in Pāli, and relating to the history of Lankā, or Ceylon (q. v.), from its earliest period down to the reign of Mahāsena, who died 302 after Christ. The older work was probably composed by the monks of the convent Uttaravihāra at Anurādhapura, the capital of Ceylon. Its date is uncertain; but it has apparently preceded the reign of Dhātusena (459—477), as that monarch ordered it to be read in public, a circumstance which seems to prove the celebrity it enjoyed already at his time.—The later work of the same name is an improved edition and continuation of the former. Its author, Mahādāsa, was the son of an aunt of the king Dhātusena, and he brings down the history of Ceylon, like his predecessor, to the death of Mahāsena. A first volume of the text of the latter work, 'in Roman characters, with a translation subjoined, and an introductory essay on Pāli Buddhist literature,' was published by the Hon. George Turnour (Ceylon, 1837). See also Lassen, *Indische Alterthumskunde*, vol. ii. p. 15 f. (Bonn, 1852).

MAHĀVĪRA (literally, 'the great hero'), also called *Vīra* and *Vardhamāna*, is the 24th or last Jina, or deified saint, of the Jainas (q. v.), described as of a golden complexion, and having a lion for his symbol. His legendary history is given in the *Kalpa-Sūtra* (q. v.) and the *Mahāvīra-Charita*, two works held in great authority by the Jainas. According to these works, M.'s first birth occurred at a period infinitely remote; it was as Naysara, head man of a village, that he first appeared in the country of Vijaya, subject to Śatrumardana. He was next born as *Marichi*, the grandson of the first Jaina saint *Rishabha*; he then came to the world of Brahmā, was reborn as a worldly-minded Brāhmana, and after several other births—each being separated from the other by an interval passed in one of the Jaina heavens, and each period of life extending to many hundreds of thousands of years—he quitted the state of a deity to obtain immortality as a saint, and was incarnate towards the close of the fourth age (now past), when 75 years and 84 months of it remained. After he was 30 years of age, he renounced worldly pursuits, and departed, amidst the applauses of gods and men, to practise asceticism. Finally, he became an Arhat or Jina; and at the age of 72 years, the period of his liberation having arrived, 'he resigned his breath,' and his body was

burned by Indra and other deities, who divided amongst them such parts as were not destroyed by the flames, as the teeth and bones, which they preserved as relics; the ashes of the pile were distributed amongst the assistants: the gods erected a splendid monument on the spot, and then returned to their respective heavens. At what period these events occurred is not stated, but judging from some of the circumstances narrated, the last Jina expired about five hundred years before the Christian era. Other authorities make the date of this event about a century and a half earlier. The works above referred to state, with considerable detail, the conversions worked by Mahāvira. Among the pupils were *Indrabhūti* (also called Gautama, and for this reason, but erroneously, considered as the same with the founder of the Buddhist religion), *Āyabūti*, *Vāyubhūti*—all three sons of Vasubhūti, a Brahman's of the Gotama tribe, and others. These converts to Jaina principles are mostly made in the same manner: each comes to the saint prepared to overwhelm him with shame, when he salutes them mildly, and, as the Jainas hold, solves their metaphysical or religious doubts. Thus, *Indrabhūti* doubts whether there be a living principle or not; *Vāyubhūti* doubts if life be not body; Man'dita has not made up his mind on the subjects of bondage and liberation; *Achalabhrātri* is sceptical as to the distinction between vice and virtue; and so on. M. removes all their difficulties, and by teaching them the Jaina truth, converts them to the doctrine of his sect. For a summary account of the life of this saint, see H. T. Colebrooke's *Miscellaneous Essays*, vol. ii. p. 213, ff.; H. H. Wilson's works, vol. i. p. 291, ff.

MAHMUD II., Sultan of Turkey, and younger son of Sultan Abdul-Hamid, was born 20th July 1785, and on the deposition of his brother, Mustafa IV., by Balaklar, Pasha of Ruschuk, was raised to the throne, July 28, 1808. Balaklar became his grand vizier, and vigorously aided him in his attempts to reform the constitution of the Turkish army. But the Janizaries, emboldened by their successful opposition to the same attempt on the part of Selim III., rose in rebellion, and the murder of the vizier put a stop for the present to the carrying out of any military reforms. M. was also attacked by the rebels, but he secured his life and throne by the destruction of all the other members of the royal House of Osman. The war with Russia now commenced vigorously; but after a conflict of three years' duration, which completely prostrated the strength of Turkey, peace was concluded at Bucharest (q. v.). The daring and energetic M. now applied himself to the subjugation of the semi-independent pashas of the outlying provinces, and to the promotion of radical reforms in all departments of the government. The rebellion of the Wahabias was crushed through the instrumentality of Ibrahim Pasha in 1818, and Ali Pasha (q. v.), the 'Lion of Janina,' was overthrown in 1822. Greece revolted in 1821, and its independence was secured by the battle of Navarino in 1827, but it was not recognised as a separate kingdom by Turkey till April 1830. During the progress of the Greek revolution, M. had been steadily though secretly maturing his plans of military reform, and in May 1826 the success of his schemes was crowned by the destruction of the Janizaries (q. v.). The consequent confusion into which Turkey was thrown was immediately taken advantage of by Russia for obtaining fresh concessions. M., however, despite these interruptions, proceeded with iron resolution in those plans of reform which he judged essential to the stability of the empire; and the disastrous termination of the succeeding war with Russia (1828—1829), far from

interfering with his projects, only stimulated him to renewed exertion. The successful revolt of the Greeks, and the late triumph of the Russians, together with the disaffection manifested by the Christian population of Turkey, excited in the ambitious mind of Mehemed Ali, pasha of Egypt, the desire for independence. See MEHEMED ALI. The war which ensued was from first to last in favour of the Egyptians; but the intervention of Russia compelled both parties to agree to a treaty (1833) which was satisfactory to neither. M. was now forced to grant fresh concessions to his 'good friend and ally,' the Czar, by the treaty of Unkiar-Skelessi (q. v.), July 8, 1833, and by another treaty in the following year. He was again at liberty to pursue his reforms in the civil administration, the principal improvements being the modification and readjustment of the more oppressive taxes, the formation of a militia on the principle adopted by England, the establishment of schools of anatomy and painting, increased privileges to Frankish merchants, and the abolition of the export duty on grain, measures of sound policy, which tended largely to consolidate the new-born prosperity of Turkey. In 1838, he concluded with Great Britain a commercial treaty, which both strengthened the connection between the two nations and advanced their mercantile interests. In 1839, he renewed the war with Mehemed Ali, but died before its conclusion, 1st July 1839, after an eventful reign of 31 years.

MAHOGANY, the wood of the trunk of the *Swietenia mahagoni*, a tree of 80—100 feet high, belonging to the natural order *Cedrelaceæ*, a native of the West Indies and of South America. It has pinnate leaves with 3—5 pair of leaflets, and panicles of small whitish or yellow flowers, the stamens united into a tube which is toothed at the summit, and set round on the inside with 8—10 anthers. The capsule is 5-celled, about the size of a man's fist, hard, woody, and oval, and the seeds are winged at the apex. It attains an immense size, second to few others, and its timber is generally sound throughout in the largest trees. The slow progress which it is observed to make, clearly indicates that the trees which are cut for use must have attained a great age: 200 years has been assumed as an approximation. It is most abundant on the coast of Honduras and around Campeachy Bay, whence the greater portion of that used in Europe is exported. St Domingo and Cuba also yield a considerable quantity, which is of a finer quality than that obtained from the mainland, which is frequently called Bay Wood, to distinguish it from the Cuba mahogany, usually called Spanish. The occupation of cutting this timber and removing it to the coast for shipment, is exceedingly laborious, and employs a large number of men and oxen. The wood varies much in value, according to the colour and beauty of curl; single logs have occasionally realised as much as £1000, for cutting into veneers, in which state it is very generally used, its great weight and value unfitting it for being always employed solid. It was first introduced into this country by accident in 1597, having been used to repair one of Sir Walter Raleigh's ships at Trinidad; but although the wood so employed was much admired, it did not become an article of commerce until rather more than a century later, when another accidental circumstance brought it into demand, and it became an article of luxury, and has since maintained the highest position as a cabinet-maker's wood. The annual imports into Britain are over 50,000 tons, exceeding half a million sterling in value. The bark has a faint aromatic smell, and a very astringent bitter taste, and in the countries where the

tree grows, is used as a medicine. In England, it has been recommended and used under the name *Mahogany Bark*, or *Amaranth Bark*, as a substitute for Peruvian Bark.—EAST INDIA MAHOGANY is the timber of the *Rokuna Tree* (*Soyimida febrifuga*), and AFRICAN MAHOGANY of the *Khaya Senegalensis*, both of the order *Cedrelaceae*.

MAHONIA. See BARBERRY.

MAHRA'TTAS, a people of Hindu race, inhabiting Central India, south of the Ganges, from Gwalior to Goa, and supposed by many to be the descendants of a Persian or North Indian people, who had been driven southwards by the Mongols. They are first mentioned in history about the middle of the 17th c., when they possessed a narrow strip of territory on the west side of the peninsula, extending from 15° to 21° N. lat. The founder of the Mahratta power was Sevaji, a freebooter or adventurer, whose father was an officer in the service of the last king of Bejapūr. By policy or by force, he eventually succeeded in compelling the several independent chiefs to acknowledge him as their leader, and with the large army then at his command, overran and subdued a large portion of the emperor of Delhi's territory. His son and (1680) successor, Sambaji, after vigorously following out his father's policy, was taken prisoner by Aurungzebe in 1689, and put to death. The incapacity of the subsequent rulers who reigned under the title of *Ramrajah* ('great king'), tempted the two chief officers of state, the *Peishwa*, or prime minister, and the *Paymaster-general*, to divide the empire between them. This was effected about 1749, the former fixing his residence at Poona, and retaining a nominal supremacy over the whole nation of the M.; while the latter made Nagpūr his capital, and founded the empire of the Berar Mahrattas. This partition, of course, required the sanction of the more important among the minor chiefs and officers of state, who gave their consent on condition of receiving a share of the spoil. The ultimate result was the partition of the Mahratta kingdom into a great number of states, more or less powerful and independent; chief among which were, besides the two above mentioned, Gwalior, ruled by the Rao Scindia; Indore, by the Rao Holkar; and Baroda, by the Guicowar. It was to be expected that the usual intestine wars would supervene, and ultimately the East India Company was compelled to interfere. The invasion of the Delhi empire by Nadir Shah afforded these wild and warlike mountaineers an opportunity, of which they eagerly availed themselves, to wrest additional territory from the feeble grasp of the Mogul emperor. From this time they discharged the office of arbiters in the quarrels between the emperor, his vizier, and his rebellious subjects; but the frightful defeat (January 1761) they sustained at the hands of Ahmed Shah Abdalli, the ruler of Afghanistan, on the field of Paniput, where they lost 50,000 men, and all their chiefs except Holkar, weakened their power for a time. They still, however, continued to be the hired mercenaries of the Delhi emperor, till the growing influence of the British compelled them to look to their own safety. After many long and bloody contests with the British and their allies, in which sometimes the whole, but more frequently a portion of the M. joined, they were one by one, with the exception of Scindiah, reduced to a state of dependence. This last-mentioned chief, having raised a powerful army, officered by Frenchmen, and disciplined after the European method, continued the contest for a number of years, till his power was finally broken in 1843. The dignity of *Peishwa* was abolished in 1818, and his territories were occupied by the British, with

the exception of a portion which was made over to another Mahratta chief, the Rajah of Satara their faithful ally; Nagpūr and Sattara subsequently reverted to the British government, but the other chiefs still possess extensive dominions under British protection.

The M. are a vigorous and active race, and though diminutive and ill-formed, are distinguished by their courage. They are of a cruel and perfidious disposition, and have exercised a most disastrous influence upon the inhabitants of the countries they have conquered. Though devout worshippers of Brahma, no distinctions of caste exist among them.

MAI, ANGELO, CARDINAL, a distinguished editor and scholar, was born in the village of Schilpan, in Lombardy, March 7, 1782. He was educated and lived till 1808 in establishments belonging to the Jesuits; but obtained an appointment, first as associate, and ultimately as doctor, in the celebrated Ambrosian Library at Milan. His career as an author dates from this appointment. In 1813, he published a translation and commentary of Isocrates, *De Permutatione*; but his reputation is due much more to his publications of the palimpsests or re-written manuscripts, the first specimen of which he issued at Milan (see PALIMPSEST). His earliest publications in that line were fragments of *Cicero's Orations*; of the *Vidularia*, a lost play of Plautus; of *Letters of Fronto*, Marcus Aurelius's preceptor; the *Chronicon* of Eusebius, and other less important works, which, however, were entirely eclipsed by his well-known edition and restoration of the *De Republica* of Cicero, published in 1820. Meanwhile, M. had been invited to Rome by Pius VII., and named to the charge of the Vatican Library, together with other honorable and emolumentary appointments. He at once turned his attention to the unedited MSS. of the Vatican, and after a short examination of this noble collection, undertook, as the mission of his life, the task of publishing those among them which had been overlooked by earlier editors, or had escaped their notice. This task he steadily pursued; and although he was appointed, in 1833, to the onerous office of Secretary of the Propaganda, and, in 1838, to the cardinalate itself, his Roman publications form a collection of an extent and importance almost unexampled in modern times. His first series was in 10 vols., entitled *Scriptorum Veterum Nova Collectio, e Vaticanis Codicibus edita* (Rome, 1825). It consists, like the great collections of Mabillon, Montfaucon, D'Achery, and others, of miscellaneous unpublished works, partly sacred, partly profane, and indifferently in the Greek and the Latin languages, comprising an entire volume of palimpsest fragments of the Greek historians, Polybius, Diodorus, Dionysius, and others. The succeeding collections, viz. *Classici Auctores ex Codicibus Vaticanis* (10 vols. 8vo, 1838), *Spicilegium Romanum* (10 vols. 8vo, 1839—1844), and *Novae Patrum Bibliotheca* (6 vols. 4to, 1853), are all on the same plan, and all equally replete with new and interesting materials. For many years, too, he was engaged in preparing an edition of the celebrated *Codex Vaticanus*, which he had printed, but the publication of which was postponed, awaiting the preparation of his intended preliminary dissertations. He died, however, rather unexpectedly, at Albano, September 8, 1854; and as no trace of the expected preliminary matter was found among his papers, the edition was published (1857) entirely without critical matter. It has, in consequence, disappointed expectation. His library, which he directed to be sold for the use of the poor of his native village, was purchased by the pope for the Vatican Library.

MAIDEN, *THE*, a name given to a machine for beheading criminals, which was in use in Scotland from about the middle of the 18th c. to nearly the end of the 17th century. It is said to have been introduced into Scotland by the Regent Morton, who had seen it at Halifax, in Yorkshire, and was himself the first to suffer by it, whence the proverb, 'He that invented the Maiden first handelled it.' Morton, for anything that is known to the contrary, may have introduced the Maiden; but he certainly was not its first victim. Fifteen years before he was put to death by it (1581 A. D.), it was employed to behead Thomas Scott of Cambus-michael, one of the murderers of Rizzio (1566 A. D.). It would seem at first to have been called indifferently 'The Maiden' and 'The Widow'—both names, it may be conjectured, having their origin in some such pleasantry as was glanced at by one of the Maiden's last victims, the Earl of Argyle (1681 A. D.), when he protested that it was 'the sweetest maiden he had ever kissed.' A frightful instrument of punishment used in Germany in the middle ages was called 'The Virgin.' But it had no resemblance to the Maiden, which was exactly like the French Guillotine (q. v.), except that it had no turning-plank on which to bind the criminal. The Maiden which was used in the Scottish capital is now in the Museum of the Antiquaries of Scotland at Edinburgh. A figure of it is given in the article GUILLOTINE.

MAIDENHAIR (*Adiantum Capillus-Veneris*), a small, delicate, and graceful fern, with bipinnate fronds, alternate obovate and wedge-shaped membranaceous pinnules on capillary stalks, and marginal sori hidden beneath oblong *indusia*; growing on moist rocks and old walls, especially near the sea; rare in Britain, but very abundant in the south of Europe, where it covers the inside of wells and the basins of fountains (as at Vaucluse) with a tapestry of the most delicate green. Another

True Maidenhair (*Adiantum Capillus-Veneris*).

species of the same genus, *A. pedatum*, a native of North America, with *pedate* leaves, has a sweet, fragrant root-stock, of which *Capillaire* (q. v.) is made. It is supposed that the name *M.* originated in the use of a mucilage made from this fern by women for stiffening their hair. This name is sometimes applied also to some species of Spleenwort (*Asplenium*), as *A. adiantum nigrum* and *A. trichomanes*.

MAIDENHEAD, a municipal borough and market-town of England, in the county of Berks, is

situated amid beautiful scenery, on the right bank of the Thames, 26 miles west of London. It carries on some trade in meal, malt, and timber, and has a large brewery. Pop. (1861) 3895.

MAIDS OF HONOUR. See **LADIES OF THE QUEEN'S HOUSEHOLD**.

MAIDSTONE (old form, *Meduocston*), the county town of Kent, England, on the right bank of the Medway, 56 miles from London by the South-eastern Railway. It is a municipal and parliamentary borough, and returns two members to parliament. It stands in a noted corn-district; its grain-market is the most important in the county; and in the vicinity are the famous hop-grounds known as 'the middle growth of Kent.' The parish church, built toward the close of the 14th c., in the perpendicular style, contains many interesting tombs. The remains of the College or Hospital of All-Saints, which grew out of a hospital founded in 1260 at the entrance of the town for the benefit of pilgrims travelling to Canterbury, are highly picturesque. *M.* has numerous educational and other institutions. An extensive oil, and several paper mills, hat and blanket manufactories, and several breweries, are in operation. Pop. of parliamentary borough (1861), 8072.

MAIGRE (*Sciaenæ aquila*), a fish of the acanthopterous family *Sciaenidae*, common in the Mediterranean Sea, but a rare visitant of the British shores. It attains a large size, being seldom taken less than three feet, whilst it is sometimes six feet long. In general appearance, it much resembles a large bass, but the head is shorter and more rounded, and the tongue and roof of the mouth are destitute of teeth. The *M.*

Maigre (*Sciaenæ aquila*).

is in very high esteem for the table, and the head is a favourite delicacy of epicures. The strength of the *M.* is such that a stroke of its tail will throw down a man; and when it is taken, the fishermen therefore quickly stun it by a blow on the head. It is one of those fishes which emit a peculiar sound, which has been described as a kind of purring or boxing, and has been heard from a depth of 120 feet. Fishermen have been guided by this sound to let down their nets so as to enclose a number of maigres. The *M.* appears to be the *umbria* of the Romans, and was highly esteemed by them. The stones of its ears were formerly set in gold, and worn on the neck, imaginary virtues being ascribed to them, particularly in the cure of colic; but it was requisite that they should be obtained as a gift, and not by purchase.

MAIL (Fr. *maille*, It. *maglia*; from the Lat. *macula*, a spot, hole, or mesh of a net) signifies a metal net-work, and is ordinarily applied to such net-work when used as body defensive armour. Well-made mail formed an admirable defence against all

weapons except firearms, and its pliability and comparative lightness gave it favour over the more cumbersome plate-armour.

MAILED CHEEKS (*Sclerogenida* or *Triglida*), a family of acanthopterous fishes, distinguishingly characterised by an enlargement of certain bones of the head and gill-covers to form a bony armour for the cheeks. They exhibit great variety of forms; some of them are remarkable for their elegance and for their delicate or splendid hues, others for their extreme ugliness. Gurnards (q. v.) are among the best known and most valuable of this family. To it belong also Bull-heads (q. v.) and *Scorpena* (q. v.). Sticklebacks (q. v.) are sometimes referred to it. The species are widely distributed in the seas of all parts of the world; a few inhabit lakes and rivers.

MAIMATCHI'N, a trading town on the northern boundary of Mongolia, opposite Kiahta (q. v.).

MAIMING is the shooting, stabbing, or otherwise seriously injuring of a person, and therefore, when treated as a criminal offence, properly belongs to the heads of Assault, Attempt to Murder, and offences against the person generally. Maiming cattle is classed under the head of Malicious Injuries to Property.

MAIMONIDES, or rather **MOSES BEN MAIMON** (**RAMBAM**—**RABBI MOSES BEN MAIMON**) B. JOSEPH B. ISAAC B. JOSEPH B. OBADJAH, &c.; Arab. **ABEN AMRAN** (**AMRU**) **MUSA BEN ABDALLAH BEN MAIMON AL-KORTABI**, was born at Cordova, March 30, 1135. Little is known of his early life, which fell in the troublous period of the Moravide rulers. His first instruction he received at the hand of his father, himself a learned man, and author of several important works in Arabic and Hebrew. Under the guidance of the most distinguished Arabic masters of the time, M. then devoted himself to the study of Greek (Aristotelian) philosophy, the science of medicine, and theology. When, in 1148, Abd-al-Mumen, the successor of Abdallah, in the newly established reign of the Al-Mohads (Unitarians), took Cordova, and, shortly afterwards, subjected all Andalusia, both Jews and Christians residing there were forced either to profess Islam or to emigrate. M.'s family, however, together with many others to whom emigration was well-nigh impossible, outwardly embraced the Mohammedan faith, or rather for the time being renounced the public profession of Judaism, all the while remaining faithful to it in secret, and keeping up a close communication with their co-religionists abroad, an arrangement in which the government readily acquiesced, since it fully answered their purpose. For more than 16 years, M. thus lived together with his whole family under the assumed character of Mohammedans; but when the death of the reigning sovereign brought no change in the system of religious intolerance, they resolved to emigrate. In 1165, they embarked, went to Acco, and, by way of Jerusalem, to Cairo, where M.'s father died. M. settled in Fostat (Old Cairo), where for some time he gained his livelihood by the jewel-trade, until his great medical knowledge procured him the high office of physician to Salah Eddin, the reigning sultan of Egypt. M.'s importance for the religion and science of Judaism, and his influence upon their development, is so gigantic, that he has rightly been placed second to Moses, the great lawgiver, himself. He first of all brought order into those almost boundless receptacles of tradition, and the discussions and decisions to which they had given rise, which, without the remotest attempt at system or method, lie scattered up and down the works

of Haggada and Halacha—Midrash, Mishnah, Talmuda. Imbued with the spirit of lucid Greek speculation, and the precision of logical thought of the Arabic Peripatetics, M., aided by an enormous knowledge, became the founder of rational Scriptural exegesis. The Bible, and all its written as well as implied precepts, he endeavoured to explain by the light of reason, with which, as the highest divine gift in man, nothing really divine could, according to his theory, stand in real contradiction. The miracles themselves, though not always traceable to their immediate cause, yet cannot be wrought in opposition to the physical and everlasting laws in nature. Where literal interpretation seems to jar upon the feelings of reverential awe towards the Highest Being, there an allegorical explanation is to be adopted unhesitatingly. Respecting M.'s philosophical system, we can barely hint in this place at its close similarity with that of Averroes; both drawing from the same classical sources, and arriving independently, and with individual modifications, to nearly the same views on the great problems of the universe. Holding reason in man—if properly developed and tutored by divine revelation—to be the great touchstone for the right or wrong of individual deeds, M. fully allows the freedom of will, and while he urges the necessity, nay, the merit of listening, to a certain degree, to the promptings of nature, he rigorously condemns a life of idle asceticism, and dreamy, albeit pious contemplation. No less is it, according to him, right and praiseworthy to pay the utmost attention to the healthy and vigorous development of the body and the care of its preservation by the closest application to hygienic rules. Providence, M. holds, reigns in a certain—broad—manner over humanity, and holds the sway over the destinies of nations; but he utterly denies its working in the single event that may befall the individual, who, subject above all to the great physical laws, must learn to understand and obey them, and to shape his mode of life and action in accordance with existing conditions and circumstances—the study of natural science and medicine being therefore a thing almost of necessity to everybody. The soul, and the soul only, is immortal, and the reward of virtue consists in its—strictly unbodily—bliss in a world to come; while the punishment of vice is the 'loss of the soul.'

M.'s first work of paramount import (several of his earlier minor writings treat of subjects of general science), begun in his twenty-third year, and finished ten years later, is his Arabic commentary of the Mishnah [translated into Hebrew by Judah Alharisi, Tibbon (father and son), Sal ben Jacob, Net. Almali, Jak. Akkasi, and others], which forms an extensive historical introduction to *Tradition*, or the Oral Law: tracing its development, its divisions, the plan of the Mishnah and its complements, &c.; and this introduction has now, for more than five hundred years, been deemed so essential a part of the Talmud itself, that no edition of the latter is considered complete without it. This was followed by the *Seder Hammiwoth*, or Book of the Precepts, in Arabic (translated into Hebrew by Abr. Ibn Chasidai, and from the author's second edition, by Moses Tibbon), which contains an enumeration of the 613 traditional laws of the Halacha, together with fourteen canons on the principle of numbering them, chiefly directed against the authors of certain liturgical pieces called *Ashuroth* (Warnings); besides thirteen articles of belief, and a psychological fragment. This book is to be considered chiefly as an introduction to the gigantic work which followed in 1180, under the title of *Mishne Thorah* (Second

Law), or *Yad Chasakah* (Strong Hand), a Hebrew compendium in 982 chapters, embracing the entire Halacha, even those of its parts no longer in practical use, such as precepts regarding the soil of Judaea and the like, and which, with the most astounding minuteness, lucidity, and precision, places the results of the legal disquisitions gathered from the Talmudical labyrinths systematically arranged before the reader. The summit of his renown, however, M. reached in his grand Arabic work, *Delalah Al-Hairin* (Heb. Moreh Nebuchim, 'Guide of the Erring'), a philosophical exegesis (translated into Hebrew by Samuel Tibbon, edited for the first time in the original by Munk, 1856, &c.), which, while on the one hand it has contributed more than any other work to the progress of rational development in Judaism, has on the other hand also become the arena for a long and bitter fight between orthodoxy and science—carrying out, as it did, to its last consequences the broad principle, that 'the Bible must be explained metaphorically by established fundamental truths in accordance with rational conclusions.' So bitter, indeed, was the contest which broke out between the subsequent spiritualistic Maimonidian and the 'literal Talmudistic' schools, that the fierce invectives were speedily followed by anathemas and counter-anathemas issued by both camps; and finally, about the middle of the 13th c., the decision was transferred into the hands of the Christian authorities, who commenced by burning M.'s books, continued by bringing to the stake all Hebrew books on which they could lay their hands, and followed this decision up by a wholesale slaughter of thousands upon thousands of Jews, men, women, and children, irrespective of their philosophical views. Under these circumstances, the antagonistic parties, chiefly through the influence of David Kimchi and others, came to a reconciliation, and withdrew their mutual anathemas; and, as time wore on, M.'s name became the pride and glory of the nation, who bestowed upon him terms like the 'Great Eagle,' the 'Light of Two Worlds,' &c. Nor was his immense celebrity confined to the narrow pale of his own creed; as early as the 13th c. already, portions of his works, chiefly the *Moreh* (Doctor Perplexorum), became, in Latin versions, the text-books of European universities.

M. himself only witnessed the beginning of the conflict, the proportions and violence of which he certainly never anticipated. At his death, which took place December 13, 1204, the grief at the loss of the 'Light of the Age' was universal in the East as well as in the West. And he has ever since been recognised universally as one of the noblest and grandest men of all times: gifted with the most powerful and brilliant qualities of mind, possessed of the most varied and astounding knowledge, and imbued with deep piety and true religion, borne aloft by undaunted energy and glowing zeal. His body was brought to Tiberias, and his tomb became a place of pilgrimage, even to his early foes.

Of M.'s smaller works, we may enumerate, in conclusion, a translation of Avicenna's *Canon*: an extract from Galen; several medical, mathematical, logical, and other treatises, spoken of with the highest praise by Arabic writers; legal decisions, theological disquisitions, &c. Portions of his great work, *Moreh*, have lately been translated into modern European languages, chiefly into German (Scheyer) and French (Munk).

MAIN (from the Latin *magnus*, great), the name applied on shipboard to the principal mast, and to all the parts belonging or adjacent to it—as, main-topmast, main-yard, main-stay, main-ahrouds, main-hatchway, main-chains, &c.

MAIN, a river of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and Red M., four miles below Kulmbach, in Bavaria. The more important of these, the White M., rises in the Fichtelgebirge, 2800 feet above sea-level. The M. has a winding westward course 300 miles in length, to the Rhine, into which it falls at Mainz. It is navigable for the last 220 miles. The principal towns on its banks are Schweinfurt, Würzburg, Aschaffenburg, Offenbach, and Frankfurt; and its chief affluents are, on the right, the Saale, and on the left, the Regnitz. The M. is one of the most picturesque of German rivers; it flows through a beautiful country, where the hill-slopes are frequently covered with vineyards, and surmounted by castles. Its waters communicate with those of the Danube by means of the Ludwigs-Kanal. See BAVARIA.

MAINE, one of the ancient provinces of France, immediately south of Normandy, corresponds to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans, now the capital of the department of Sarthe.

MAINE, the most eastern of the five New England states in America, extends from lat. 42° 57' to 47° 32' N., and from long. 66° 52' to 71° 6' W., being 303 miles from north to south, and 212 from east to west, with an area of 31,766 square miles, or 20,330,240 acres. M. is bounded N. by Canada, E. by New Brunswick, S. by the Atlantic Ocean, and W. by New Hampshire and Canada. It has, on the south, a coast-line of 278 miles in a line, but so indented with bays as to make 2486 miles. The largest of these bays are the Penobscot, Machias, Saco, Passamaquoddy, &c. Into these empty the rivers Penobscot, Kennebec, Saco, Androscoggin, &c. Numerous islands stud the coast: the largest, Mount Desert, remarkable for its scenery, contains 60,000 acres. In the northern portions of the state are numerous lakes; the largest, Moosehead, being 35 miles long, and the source of the Kennebec River. The country is hilly, with a range of mountains stretching north-east from the White Mountains of New Hampshire; Mount Katahdin, near the centre of the state, is 5000 feet high. On the coast are fine granite quarries; interior, metamorphic rocks and minerals, limestone and argillaceous slates. The climate ranges from 20° or 30° below to 100° above zero. The forests are rich in pine, spruce, hemlock, maple, &c., and the chief agricultural products, wheat, rye, Indian corn, apples, and pears. The rivers and coast abound in fish. One of the chief exports is lumber; and one-third of all the ships of America are built on the rivers and harbours of this state. The falls of the rivers furnish immense water-power for saw-mills and factories. M. has 600 miles of railway, 68 banks, 4500 public schools, 13 colleges, 1200 churches, and 49 periodical publications. The government consists of a governor, senate, and house of representatives, elected by universal suffrage. M. was settled in 1621, and was a part of Massachusetts until 1820. In its early history it is said that every 20th settler was killed by the Indians. A controversy respecting the north-eastern boundary of M., which threatened to produce war with England, was settled by a compromise of claims in 1842. The chief towns are Portland, Augusta, the capital, Bangor, Bath, Hallowell, &c. Pop. in 1820, 298,335; in 1860, 628,276.

MAINE-ET-LOIRE, an inland department of France, forming a portion of the lower basin of the Loire, is bounded on the W. by the department of Loire-Inférieure, and on the E. by that of Indre-et-Loire. Area, 1,760,874 square acres, of which

1,087,834 acres are arable, 187,748 in meadow, and 95,436 in vineyards. Pop. (1868) 638,012. The surface is gently undulating. The soil is fertile, producing the usual crops, white and green, and a variety of excellent fruits. Wines, red and white, the latter comprising several highly esteemed varieties, are extensively cultivated; 11,000,000 gallons are made annually. Iron and coal mines are worked; and there are numerous mills and factories for the production of cotton, woollen, and linen goods. The department is divided into the five arrondissements of Angers, Baugé, Segré, Beaupréau, and Saumur. Capital, Angers.

MAINOTES, the inhabitants of the mountainous district of Maine, a peninsula between the bays of Kolokythis and Koron, forming part of the province of Laconia, in Greece. They have been regarded as the descendants of the ancient Spartans, whose land they now occupy; but more probably they are of Slavonic origin. They number about 80,000, and are a wild and brave race, but superstitious, and addicted to robbery. While the Turks held possession of Greece, the M. were almost completely independent; and when not engaged in a common struggle against the Turks, their chiefs were at war with each other. The M., under their principal chief or bey, took a prominent part in the war for the liberation of Greece; but after the death of Mavromikalis, their last bey, their independence was destroyed.

MAINPRISE, in English Law, was a term denoting a security by which the bailor or mainprisor took the party bailed under his own personal charge or friendly custody, giving security to produce him at the time appointed. The practice is now obsolete, and superseded by Bail (q. v.).

MAINTENANCE is a law-term commonly used to denote an illegal succouring of a person, as by lending money to a stranger in carrying on lawsuits. Contracts are sometimes held to be illegal on this ground.

MAINTENANCE, CAP OF, sometimes called *Cap of Dignity*, a cap of crimson velvet lined with ermine, with two points turned to the back, originally only worn by dukes, but afterwards assigned to various families of distinction. Those families who are entitled to a cap of maintenance place their crests on it instead of on a wreath. According to Sir John Fergus, the wearing of the cap had a beginning from the duke or general of an army, who, having gotten victory, caused the chiefest of the subdued enemies

Cap of Maintenance.

whom he led to follow him in his triumph, bearing his hat or cap after him, in token of subjection and captivity. Most of the reigning dukes of Germany, and various families belonging to the peerage both of England and of Scotland, bear their crests on a cap of maintenance.

MAINTENON, FRANÇOISE D'AUBIGNÉ, MARQUISE DE, was the daughter of Constant d'Aubigné and of Jeanne de Cardillac, and granddaughter of Théodore Agrippa d'Aubigné, well-known for his writings, his attachment to Protestantism, and his energetic character. Françoise was born 27th November 1635, in the prison at Niort, where her father was then imprisoned. On obtaining his release, he went (1638) with his wife and daughter to Martinique in the West Indies, where he died in 1645. After her father's death, Françoise returned, with her mother, to France; and her mother also

dying, her father's sisters took her under their care, and educated her in a convent, where her conversion to the Roman Catholic religion was accomplished at the age of about 14 years—after an obstinate resistance, in which she braved her child, to use her own words, *fatiguant les prières à Dieu & la mort*. It is singular to reflect what a scold she afterwards became. When she was 14, she became acquainted with the poet Scarron (q. v.), who, struck by her beauty, intelligence, and hapless condition, offered her his hand, or, if she should prefer it, a sum of money sufficient for her entrance into a nunnery. Although Scarron was lame and deformed, she chose to marry him, and now lived in the midst of the refined and intellectual society which frequented the house of the poet. On his death, a 1680, she was reduced to great poverty, and prepared to go as a governess to Portugal, when Madame de Montespan (q. v.) obtained her a pension from the king. Four years afterwards, she was intrusted with the education of the two sons whom Madame de Montespan had borne to Louis XIV., and in the capacity displayed a patient tenderness and disinterested care that no mother could have surpassed; and now becoming acquainted with the king, was fascinated him, so that he bestowed on her 100,000 livres, with which she bought the estate of Maintenon; and at last she succeeded in supplanting Madame de Montespan. It is difficult to describe her relation to the king. She was not, it is believed, his mistress in the ordinary sense of the term, but from that time to the end of his life, she exercised an extraordinary ascendancy over him. She had a passion for being thought 'a mother of the church,' but while she confessed the strength of her debts to Romanism the Huguenots, she earnestly desired that she approved of the detestable *draguonnades*. In 1684, about eighteen months after the death of the queen, Louis privately married her. She was much disliked by the people, but the courtiers sought her favour, and her creatures were made ministers and generals. In the midst of splendour, and in the possession of great power, she was confessedly very unhappy. She carefully brought up the children of Madame de Montespan; and it was at her instigation that Louis attempted to legitimize them. When he died in 1715, she retired to the former Abbey of St. Cyr, which, at her wish, had been changed, thirty years before, into a convent for young ladies. Here she died, 18th April 1718. She received, to the end of her life, the honours of a king's widow. Her pretended Memoirs are spurious, but her *Letters* (5 vols. Amst. 1766, &c.) are genuine. By far the best edition is that published by M. Lavoisier (1864) as *œuvres de Mme de Maintenon publiées pour la première fois d'après les Manuscrits et Copies authentiques, avec un Commentaire et des Notes*.

MAINE (MAYENCE, ancient *Moguntiacum*), the most strongly fortified city in the German Confederation, is situated in 50° N. lat., and 8° 10' E. long., in one of the most fertile of the wine-bearing districts of Germany, having for its site a gentle slope on the left bank of the Rhine, near the junction of the Main. The population was in 1861 30,702, exclusive of the regular confederate garrison of 10,000. A floating bridge, resting on 40 pontoons, connects M. with the Rhenish village of Castel, which is included within its vast and important system of fortifications. These works, which extend a length of nearly ten miles, consist of 14 principal and numerous lesser bastions, in addition to the four towers of Castel, Mars, Montebello, and Petermann. In accordance with a decree of the Congress of Vienna, M. was surrendered to the grand duke of Hesse-Darmstadt in 1814, on condition that it was to constitute a German federal stronghold, and be

garrisoned in common by Austrian, Prussian, and Russian troops. Austria and Prussia, moreover, take it in turn to appoint the governor, vice-governor, and commandant of the forces, who hold their posts five years, but retire by such a mode of rotation as annually to vary the Austrian and Prussian preponderance. M., which is one of the most ancient cities of Germany, retains many evidences of mediæval taste, and consists principally of narrow crooked streets; but of late years a new town has sprung up on the site of the ancient Roman city, and numerous sanitary improvements have been effected under the joint direction of the grand-ducal and civic authorities. M. has one Protestant and ten Catholic churches, among the latter of which the most noteworthy are that of St Ignacius, with its beautifully painted roof, and the cathedral, a memorable building, which was begun in 978, and after having been six times destroyed by fire, or through war, was restored by Napoleon. It has one great tower, 400 feet in height, and 6 lesser towers, 14 altars, and 20 minor chapels. M. possesses numerous Roman remains, the most remarkable of which are the *Eichstein*—a mass of stones supposed to be a memorial erected in honour of Drusus—and the ruins of a vast aqueduct at Zalsbach. M. has a gymnasium, a seminary for priests, a normal school, a picture-gallery, museums, and a public library containing nearly 100,000 volumes. Among the industrial products of M., which include artificial pearls, isinglass, tobacco, vinegar, soap, carriages, musical instruments, furniture, and articles in leather, the first and the last have acquired special reputation. M., from its position, necessarily enjoys a very important transit-trade, both by railway and river steam-navigation; and since the abrogation of many onerous restrictions, it has become one of the great internal ports for the corn and wine trade. The history of M. connects it with Rome from the year 13 B.C., when Drusus built on its site the castle of *Magontiacum*; but although it derives some interest from this circumstance, it owes its real importance to Charlemagne. It has acquired celebrity as the cradle of printing, which is generally believed to have been invented by Gutenberg, a native of the city. In November 1857, the explosion of a powder-magazine occasioned the destruction of many buildings and the loss of many lives.

MAISTRE, COMTE JOSEPH DE, was born 1753, in Chambéry, of a noble French family, which had settled in Savoy. While Savoy was occupied in 1792 by the French, M., who was a member of the senate, withdrew from the country; and when the king of Sardinia, in 1799, was compelled to retreat to the island of Sardinia, M. accompanied his court, and in 1803 was sent as ambassador to St Petersburg. In this post he remained until 1817, when he was recalled to occupy a place in the home government, and continued to reside in Turin till his death, on February 25, 1821. M. was an ardent advocate of legitimacy, and in his later career became one of the most eminent writers of the new (or liberal) conservative school in politics and religion, of which Chateaubriand may be regarded as the head. He had obtained some reputation as a writer at a very early period. His first work of note, *Considérations sur la France*, appeared in 1794. His later works were written either at St Petersburg or after his return to Turin. They are—*Essai sur le Principe Générateur des Constitutions Politiques* (St Petersburg, 1810); *Du Pape* (Lyon, 1821); *De l'Eglise Gallicane* (Paris, 1821—1822); *Scènes de St Petersburg* (2 vols. 1822); and a posthumous work, *Examen de la Philosophie de Bacon* (Paris, 1836).

MAITLAND, the name of a Scottish family, celebrated both in the literary and political history of their country. The first who acquired distinction was SIR RICHARD M. of Lethington, son of William M. of Lethington and Thirlstane, who fell at Flodden, and of Martha, daughter of George, Lord Seaton. He was born in 1496, studied at St Andrews and in France, and on his return to Scotland was successively employed by James V., the Regent Arran, and Mary of Lorraine. About 1551—1552, he received the honour of knighthood, became a lord of the Court of Session in 1561 (before which, however, he had the misfortune to lose his sight), and Lord Privy Seal in 1562. He died 20th March 1586, at the age of 90. M. was one of the best men of his time. In an age of violence, fanaticism, and perfidy, he was honourably conspicuous by his moderation, integrity, and anxiety for the establishment of law and order. He merits consideration not only as an eminent and upright lawyer, but as a poet, a poetical antiquary, and an historian. All his own verses were written after his 60th year, and shew what things he had most deeply at heart. For the most part, they consist of lamentations for the distracted state of his native country, the feuds of the nobles, the discontents of the common people, complaints 'againis the lang proces in the courts of justice,' and the depredations 'of the border robbers.' A complete edition of M.'s original poems was first published in 1830 (1 4to vol.) by the Maitland Club, a society of literary antiquaries, taking its name from Sir Richard. His collection of early Scottish poetry was a work undertaken, if not completed, before his blindness attacked him. It consists of two MS. vols., the first containing 176, and the second 96 pieces; they are now preserved in the Pepysian Library, Magdalene College, Oxford. M.'s principal historical performance is the *Historie and Chronicle of the Hous and Surname of Seyntoun, &c.*

MAITLAND, WILLIAM, better known as 'Secretary Lethington,' was the eldest son of Sir Richard Maitland of Lethington, and was born about 1525. Like his father, he was educated both at St Andrews and on the continent, and quickly displayed great aptitude for a political career. He became a convert to the Reformed doctrines about 1555, but could not have been a very violent partisan, since in 1558 he was appointed Secretary of State by Mary of Guise. In the following year, however, he openly joined the Lords of the Congregation, and was one of the Scotch commissioners who met the Duke of Norfolk at Berwick, to arrange the conditions on which Queen Elizabeth would give them assistance. In 1561, after the arrival of Queen Mary from France, he was made an extraordinary Lord of Session. He strongly objected to the ratification of Knox's *Book of Discipline*, and in 1563 conducted the prosecution raised against Knox for treason: from this time he appears to have split with the Reformers. In 1564, he held a long debate with Knox on the claims of the Reformed Church to be independent of the state. In 1566, he took part in the conspiracy against Rizzio, after whose assassination he was proscribed, and obliged to seek shelter for some months in obscurity. He was, it is believed, cognizant of Bothwell's scheme for the murder of Darnley; yet, when he saw the hopeless nature of Bothwell's designs, he immediately joined the confederacy of the lords. While Mary was still a prisoner at Loch Leven, he is said to have written to her, offering his services, yet he was present at the coronation of King James VI., 1567; and although he secretly aided in the escape of the queen, he fought against her on the field of Langside. In 1568, he accompanied the Regent Moray to the conferences held at York regarding the Scottish queen; but even

here he tried to further her interests, and is said to have been the first to propose to the Duke of Norfolk a union between him and Mary. The Scottish lords now felt that he was a dangerous enemy to the commonwealth, and in 1569 he was arrested at Stirling, but was liberated shortly after by an artifice of Kirkcaldy of Orkney. After the murder of the Regent Moray, he and Kirkcaldy became the soul of the queen's party, in consequence of which he was declared a rebel, deprived of his offices and lands by the Regent Morton, and besieged, along with Kirkcaldy, in Edinburgh Castle. After a long resistance, the castle surrendered, and M. was imprisoned in Leith, where he died, 'some,' says Melville, 'supposing he took a drink and died, as the old Romans were wont to do.' Buchanan has drawn his character with a severe pen in his Scottish tract entitled *The Chameleon*.

MAITLAND, JOHN, DUKE OF LAUDERDALE, grandson of John, first Lord Thurstane, brother of the famous Secretary Lethington, and son of John, first Earl of Lauderdale, and of Isabel, daughter of Alexander Seaton, Earl of Dunfermline and Chancellor of Scotland, was born at the ancient family seat of Lethington, 24th May 1616. He received an excellent education, being skilled, according to Bishop Burnet, in Latin, Greek, Hebrew, history, and divinity, was carefully trained in Presbyterian principles, and entered public life as a keen and even a fanatical Covenanter. In 1643, he attended the Westminster Assembly of Divines as an elder of the Church of Scotland, and was a party to the surrender of Charles I. to the English army at Newcastle. Shortly after, however, he changed his politics altogether, and became a decided royalist. When Charles II. came to Scotland from Holland, Lauderdale accompanied him; but being taken prisoner at the battle of Worcester in 1651, was kept a prisoner for nine years. Set at liberty by General Monk, in 1660 he hastened to the Hague, and was warmly received by Charles. After the removal of Middleton in 1662, and of Rothes in 1667, Lauderdale was practically the sole ruler of Scotland, and for some time displayed a spirit of moderation, and an apparent regard for the religious feelings of his countrymen; but he soon became a bitter persecutor, sent multitudes of the Covenanters 'to glorify God at the Grassmarket,' and repelled in blasphemous language the remonstrances which many distinguished persons ventured to make. In 1673, Charles showed his appreciation of Lauderdale's character and conduct by creating him Marquis of March and Duke of Lauderdale, two years afterwards, he was raised to the English peerage by the title of Viscount Petersham and Earl of Guilford, and received a seat in the English Privy Council. He was one of the famous 'Cabal'; but having, by his domineering arrogance, excited the disgust and hatred of his colleagues, as well as of the whole English nation, he fell into disgrace, was stripped of all his offices and pensions in 1682, and died at Tunbridge on the 24th August of the same year. Lauderdale, according to Burnet, 'was in his principles much against popery and arbitrary government,' and his infamy consists in his shameful sacrifice of his convictions to his interests. He was a rude, blustering, passionate man, with what the Duke of Buckingham called a 'blundering understanding.' Burnet has also given us a picture of his appearance. 'He was very big, his hair red, hanging oddly about him. His tongue was too big for his mouth, which made him bedew all that he talked to; and his whole manner was very unfit for a court.'

MAITREYA was, according to the Buddhists, a disciple of the Buddha Sakyamuni and a Bodhi-

sattva, or a man of pre-eminent virtue and sanctity. He is classed in their mythology amongst the ten called Tushita, or 'the happy,' and has generally the epithet *Ajita*, or 'unconquered.' The Buddhists believe that he will become incarnate as the future Buddha. In Tibetan, he is called *Jampa*. A faithful representation of this Buddha, surrounded by the (Tibetan) goddesses Dolma, the Master or Buddha of medicine, two ancient priests, and various saints, will be found in the sales of Lord Schlegel's *Buddhism in Tibet* (London and Leipzig, 1863), where an interesting sketch is given (p. 207, f.) of the characteristic types of Bodhi images, and of the measurements of Buddha statues made by his brothers in India and Tibet.

MAIZE (*Zea*), a genus of grasses, having numerous flowers; the male flowers forming a few panicle at the top of the culm; the female flowers in axillary spikes, enclosed in large tough sheaths from which only the extremely long styles—in the common species 6–8 inches long—hang on the tufts of feathery or silken tassels. The grain is large, roundish, compressed, naked, and arranged in parallel rows along the upright axis of the spike. The common *M.* or *Indian Corn* (*Z. mays*), is generally believed to be a native of the warmer parts of America, where it was cultivated by the aborigines before the discovery of America by Columbus. But a representation of the plant found in an ancient Chinese book in the royal library in Paris, and the alleged discovery of some grains of it in the cellars of ancient houses in Athens, have led some to suppose that it is a native also of the East, and has from a very early period been cultivated there, and even that it is the 'corn' of Scripture, although on this supposition, it is not easy to account for the subsequent neglect of it until after the discovery of America, since which the spread of the cultivation in the Old World has taken place with a rapidity such as might be expected from its great productiveness and other valuable qualities. Columbus himself brought it to Spain about the year 1493. It is now in general cultivation in the south of Europe, and supplies a principal part of the food of the inhabitants of many countries of Asia and Africa. It is by far the most productive of all the cereals; in the most favourable situations yielding an increase of eight hundred for one, while an increase of three hundred and fifty or four hundred for one is common where irrigation is practiced and even without this the return is large. *M. mays* well in tropical and sub-tropical climates, not being a short-lived annual, is cultivated also even the heat of summer is intense and of sufficient duration, whatever may be the cold of winter. Thus its cultivation extends to the northern parts of the United States, and is pretty common in Germany; although the want of sufficient summer heat renders it a very uncertain crop even in the southern parts of Britain. Some of the varieties of *M. mays*

Maize, or Indian Corn
(*Zea mays*)

MAJESTY—MAJOR.

about five months from the time of sowing for the ripening of their grains; whilst others, which, of course, are preferred in countries having a comparatively short summer, ripen in six weeks, or even less, but they are much less productive. The varieties are very numerous, of taller or humbler growth, from three to ten, or even fourteen feet; with yellow, white, brownish-red, or purple, glass-like, somewhat translucent grains, which vary very much in size. The culm is stout and erect; the leaves from one foot to two feet long, and two or three inches broad; the ears or cobs generally two or three in number, situated below the middle of the stem; in the large varieties, often above a foot long, and thicker than a man's wrist, in the smallest varieties, four or five inches in length. *M.* succeeds best in light, rich, deep, and rather moist soils; and dislikes shady situations. It is very generally planted in little hillocks raised at intervals, and to each of which five or six seeds are allotted. North American settlers generally make it their first crop on newly cleared and very partially tilled ground. The grains of *M.* make a very palatable kind of groats, and afford an excellent meal for baking purposes. The meal is not, however, adapted for making bread without a mixture of wheat, flour, or rye, owing to its deficiency in gluten; although, in oily or fatty matter, *M.* is richer than any other grain, and is very nutritious. *M.* meal mixed with rye meal forms the common brown bread of New England. *M.* very coarsely ground and boiled forms the *hominy* of the Southern States of North America. The porridge made of *M.* meal is called *mush* in North America; and the entire grains are used under the name of *hulled corn* or *samp*. The unripe grains, slightly roasted, burst and turn inside out, assuming a very peculiar appearance; in this state, they are known as *pop-corn*; and in this state are a favourite article of food in America, and have recently become common in shops in Britain. The cobs of *M.*, ripe or unripe, are gathered with the hand. The unripe cobs are often pickled; they are also often boiled for the table. A kind of beer called *Chica* (q. v.) is made from *M.*, also a spirituous liquor, and vinegar. The starch of *M.* is a good substitute for arrow-root, and is now well known in Britain, under various names, as *Onwego Flour*, &c.—The pith of the culm, before the flowers are produced, abounds in a sweet juice, which, being extracted by pressure, is boiled into an excellent sirup, and has sometimes been employed to furnish sugar; it is also fermented and distilled, and yields a good spirituous liquor. The small young stalks of thickly sown crops are cut over by the Mexicans, as an article for the dessert. In countries where *M.* does not ripen well, it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain, the dried leaves are used as winter fodder. The tops, cut off after flowering, are stored for the same use. The stalks are used for thatch and for fuel, and for making baskets. The fibres of the culm and leaves afford a durable kind of yarn; and the bracts or spathes which surround the ear are elastic, and can be applied to the stuffing of chairs, saddles, &c., and to the manufacture of good durable mattresses, which have become a profitable article of trade in Paris and Strasbourg. The spathes are also much used for packing oranges and lemons; and in South America for making cigarettes. Good paper has been manufactured from them.—There are few plants of which the uses are more various than *M.*, and few which are of greater importance to man.—For separation of the grains of *M.* from the ears, a particular kind of thrashing-machine is used.—Another species of *M.*,

called *CHILI M.*, or *VALPARAISO CORN* (*Z. Curagua*), is distinguished by its serrated leaves. It is a smaller plant, a native of Chili, and has won a superstitious regard, because its grains when roasted split in the form of a cross.

MAJESTY, a title of honour now usually bestowed on sovereigns. Among the Romans, *majestas* was used to signify the power and dignity of the people; and the senatorial, consular, or dictatorial majesty was spoken of, in consequence of these functionaries deriving their power from the people. After the overthrow of the republic, *majestas* became exclusively the attribute of the emperors, *dignitas* being thenceforth that of the magistrates. The *majestas* of the emperors of Rome was supposed to descend to those of Germany as their successors; but the adoption of the attribute by other European sovereigns is of comparatively late date. Its use began in England in the latter part of the reign of Henry VIII., up to which time 'Your Grace' or 'Your Highness' had been the appropriate mode of addressing the sovereign. Henry II. was the first king of France who was similarly styled, and Louis XI. and his successors became entitled, in virtue of a papal bull, to call themselves by the title of 'Most Christian Majesty.' Ferdinand and Isabella of Spain similarly obtained for themselves and their successors the title of 'Most Catholic Majesty;' and Stephen, Duke of Hungary, and Maria Theresa, of 'Apostolic Majesty.' The emperor of Austria is now styled his Imperial Royal Majesty; in German, 'K. K. (abbreviated for 'kaiserliche königliche) Majestät.' Emperors, kings, and queens are now generally addressed as 'Your Majesty,' not including the sultan of Turkey, whose proper style is 'Your Highness.' The sovereign of the United Kingdom is personally addressed as 'Your Majesty;' and letters are addressed to 'The King's' or 'Queen's' 'Most Excellent Majesty.'

In Heraldry, an eagle crowned, and holding a sceptre, is blazoned as an 'eagle in his majesty.'

MAJOLICA, a name at first given by the Italians to a certain kind of earthen-ware, because the first specimens that they saw came from Majorca; but as subsequently a large manufacture of the same kind of earthen-ware was carried on at Faenza, the name majolica was dropped, and 'Faience' substituted. The term majolica is now used to designate vessels made of coloured clay, and coated with a white opaque varnish, so as to resemble 'faience;' it is of much less value, and is very common in Italy.

MAJOR, a term in Music, applicable to those intervals which are susceptible of being lowered a semitone without becoming false. See **INTERVAL**. Major is chiefly used as applied to the mode, key, or scale, which is said to be in the major when the third above the key-note is a major third—that is, when it is distant from the key-note four semitones;

thus, C C♯ D D♯ E
 1 2 3 4

MAJOR, in the Army, is the second field-officer in a battalion of infantry or regiment of cavalry. He ranks next to the lieutenant-colonel, is mounted, and is responsible, with the adjutant, that the men are properly drilled and equipped. He commands in the absence of the lieutenant-colonel. In action, or on the march, he usually has charge of one wing. The pay of a major ranges from £1, 4s. 5d. a day in the household cavalry, to 16s. a day in the infantry of the line; and the regulation price of his commission in the cavalry and infantry of the line is £3200. There are no majors in the Royal

Artillery, Royal Engineers, or Royal Marines. Used adjectively, the word *major*, in the army, signifies a superior class in a certain rank, as sergeants-major, who are superior sergeants; except in the case of general officers, in which its signification is arbitrarily limited to major-general, the third of the four classes of generals.

MAJORCA (Spanish, *Mallorca*), the largest of the Balearic Isles (q. v.), lies 107 miles south-east of the mouth of the Ebro, the nearest point of the Spanish coast, and 171 miles north of Algiers. Its greatest length (from east to west) is 64 miles, and its breadth (from north to south) 48 miles, with an area of about 1386 English square miles. The north-east half of the island is mountainous; the other parts are finely diversified with hills, valleys, and plains. The climate is healthful, the sea-breeze preserving a nearly equable temperature over the whole island. The inhabitants, who much resemble the Catalans in their appearance and manners, number (1857) about 200,000, are hospitable and industrious, and mostly employ themselves in agriculture. The chief products of the island are marble, slate, plaster, the common cereals and legumes, oranges, silk, lemons, oil, wine of excellent quality, olives, and aromatic herbs. The chief town is Palma (q. v.), the capital. The Spanish government makes use of M. as a place of banishment for political offenders.

MAJORITY is the age at which a person in this country acquires the status of a person *aut juris*—i. e., is able to manage his or her own affairs. This age, in the United Kingdom, is 21. Under that age, persons in England and Ireland are called infants, and are more or less subject to guardians, who manage for them their property. In Scotland, young persons are called minors between 12 (if females) or 14 (if males) and 21. It is chiefly with respect to the management of property that the distinction of majority is fixed upon, as it is assumed that persons under that age have not discretion and firmness to enter single-handed into contracts. It is also a common period fixed upon in wills at which to make provisions payable. As far as liability for crime is concerned, majority makes no difference, for all persons are capable of crime, when they have discretion enough to know that particular acts are criminal. A minor can, in Scotland, make a will of movable estate, but cannot do so in England.

MAKALLAH, a seaport on the south coast of Arabia, 300 miles east-north-east of the port of Aden. It has a well-protected harbour, and is much frequented by vessels for the purpose of laying in stores. It exports gum, hides, and senna, and is an extensive slave-market. Pop. about 4500.

MAKIA'N, one of the Moluccas (q. v.).

MAKO', a market-town of Hungary, on the right bank of the Maros, 16 miles east-south-east of Szegedin. Pop. 25,595, many of whom are Jews. The town contains numerous mills, and is famous for its breed of oxen, which are of unusually large size.

MAKRIZI, **TAKI ADDIN ABU AHMAD MOHAMMAD**, an eminent Arabic historian and geographer, was born in 1360 A. D., in Makris, near Bealbec. He early devoted himself to the study of history, jurisprudence, tradition, astrology, &c., at Cairo, where also he afterwards held the offices of mohtasib, or inspector of weights and measures, and of khatib and imam at different mosques. The most important of his numerous works are a *Topographical History of Egypt*, a *History of the Mamluk Sultans*, and two treatises on Moslem (Kufic) coins,

weights, and measures, which have been edited and translated by Tycheus (into Latin), and by Silvestre de Sacy (into French). M. also commenced a work *On the Important Personages who had visited Egypt*, intended to fill 80 vols.; but only a small portion of these (one autograph volume is in the Imperial Library at Paris) was really accomplished. He died, at the age of 82 years, in 1442 A. D.

MALABAR, a maritime district of British India, in the presidency of Madras, is bounded on the E. by the district of Coimbatore, while on the W. its shores are washed by the Arabian Sea; and it extends in lat. from 10° 15' to 12° 18' N. N. Area, 6050 square miles; pop. 1,514,909; net revenue, £260,478. The surface is occupied in the east by the Neilgherries, and the Western Ghats cover a great portion of the district. The name of this district is applied to the whole south-western coast of Southern India.

MALABATHRUM, a name given by the ancient Greeks and Romans to aromatic leaves, which were in high repute among them, both as a medicine and a perfume, and with which they sometimes flavoured wine. These leaves were brought from India, whence they were often called *Indicæ Leaves*; and from the value in which they were held, sometimes simply *Leaves*, just as the term Bark is now used to designate the medicinal bark of the Cinchona. Many fabulous accounts were current of their origin. They are now pretty certainly known to be the same with the leaves sold in every Indian bazaar under the name of *Tigpat*, the produce of two nearly allied species of Cinnamon (*Cinnamomum Tamala* and *C. albigrosum*), growing in the dense forests of the Himalayan valleys; and the name M. is regarded as a corruption of *Tamala-patra*, Tamala leaf. They are aromatic, fragrant, and gently stimulant.

MALACCA, a British maritime settlement on the south-west coast of the Malay Peninsula, extends in lat. from 2° to 3° N., and long. from 102° to 103° E. It is 40 miles in length, and, including the district of Nanning, about 25 miles broad. Area, about 1000 square miles; pop. estimated at 60,000. Near the coast, which is washed by the Strait of Malacca, the surface is flat and swampy, producing rice. Inland, there are low hills, Mount Ophir rising to 3920 feet. Although little agriculture is carried on, and the greater portion of the country is still in the condition of jungle, the soil is fertile in rice, sago, pepper, fruits, vegetables, rattans, and timber. In the district of Nanning are tin-mines of some value. The climate is remarkably salubrious; the land and sea breezes are regular; and the thermometer ranges from 72° to 85°. The town and seaport of M., capital of the district of the same name, is situated in lat. 20° 11' N., long. 102° 16' E., at the mouth of a small river which flows into the Strait of Malacca. It is handsome and well built, and presents a fine appearance from the sea. Its most interesting building is the church of our Lady del Monte, the scene of the labours and supposed miracles of St Francis Xavier, the 'Apostle of the East.' Pop. variously estimated at from 5000 to 15,000.

M. was taken by the Portuguese under Albuquerque in 1509; became a Dutch possession in 1642; fell, in 1795, into the hands of the British, to whom it was finally ceded in 1824. Since September 1851, M., together with Singapore and the Prince of Wales Island, have formed a portion of the government of the presidency of Bengal.

MALACCA, STRAIT OF, separates the Malay Peninsula on the north-east from the island of Sumatra on the south-west. Length, 530 miles;

breadth varying from 25 miles at the south-east to 200 miles at the north-west extremity. In this strait are the British settlements of Singapore, Malacca, and Penang.

MALACHI (probably an abbreviated form of *Malachyah*, meaning 'messenger of Jehovah'; the Seventy and the Vulgate have *Malachias*), the name given to the last canonical book of the Old Testament. Regarding its author, nothing whatever is known. It has even been doubted whether M. is a proper name or only an appellative; the Seventy, the Chaldee, Jerome, and many modern scholars—Vitrings, Hengstenberg, Umbreit, &c.—favour the latter view. The period when the writer of M. composed his prophecies is conjectured to have been during the governorship of Nehemiah, or about 420 B.C. The book exhibits that strict regard for the proper observance of the ceremonial law, and that hatred of foreign marriages, &c., which marked the religious Jews after the return from exile, but has little of the old prophetic fire, freedom, and dramatic force.

MALACHITE, a mineral, essentially a carbonate of copper, of a green colour, often found as an incrustation or stalactitic along with other ores of copper; often in large masses, and often also crystallised in rather oblique four-sided prisms, bevelled on the extremities, or with the beveling planes truncated so as to form six-sided prisms. It is often of a fibrous structure. It is valuable as an ore of copper, although seldom smelted alone, not only because it is found along with other ores, but because the metal is apt to be carried off with the carbonic acid. It is

Crystal of Malachite.

sometimes passed off in jewellery as turquoise, although easily distinguished by its colour and much inferior hardness. It is used for many ornamental purposes; slabs of it—chiefly from the mines of Siberia—are made into tables, mantel-pieces, &c., of exquisite beauty. In 1835, a mass of solid M. was found in the Ural Mountains of more than seventeen feet in length, and weighing about 25 tons.

MALACHY, IMAR, Archbishop of Armagh, in Ireland, and a saint of the Roman Catholic Church, is remarkable not only for his connection with a very important period of Irish church history, but also from the circumstance of his biography having been written by his distinguished contemporary, St Bernard. M. was born, in the end of the 11th c., of a noble family, and having been educated by a hermit named Imar, received orders at an early age from the hands of Celsus, Archbishop of Armagh. His reputation for learning and sanctity was unexampled in that age, and Celsus had early designated M. as his successor in the see of Armagh; but M. protested against it, in consequence of an abuse similar to that of **LAY IMPEDEMENT** (q. v.), by which the temporalities of the see were held by laymen, called *Courts*. In the end, however, he was elected, with the full rights of his see, and soon afterwards, in his capacity of primate, took measures for the reform of the many abuses which prevailed in all the churches of Ireland. He went to Rome during the pontificate of Innocent II., and having in vain sought permission to resign his see, and retire to Clairvaux, returned to Ireland invested with extraordinary powers as legate of the pope. In this capacity, he made a visitation of Ireland, and many of the controversies as to the ancient religious usages of the Irish Church, which would be out of place in this publication, turn upon this period. M. again repaired to France

in 1147, in order to meet the pope, Eugene III., during his visit to that country; but before his arrival, the pope had returned to Rome, and M., during a visit to his friend, St Bernard, at Clairvaux, was seized with an illness which ended in his death in the year 1148. A curious 'Prophecy concerning the Future Roman Pontiff,' is extant under the name of Malachy. It designates, by a few brief phrases, the leading characteristics of each successive reign, and in some instances these descriptive characteristics have proved so curiously appropriate as to lead to some discussion. The characteristic of Pío Nono, *Oves de Cruce* (cross after cross), was the subject of much speculation. That the prophecy really dates from the time of M., no scholar now supposes; it was unknown not only to St Bernard, but to all others, until the 16th century. It is first noticed in the end of that century, but it may be a sufficient indication of its worth to state that neither Baronius nor any of his continuators deemed it deserving of attention.

MALACOLOGY (Gr. *malakos*, soft), a name now not unfrequently employed to designate that branch of natural history which has *molluscs* (called *malakia* by Aristotle) for its subject. Linnæus, and the naturalists who preceded him, devoted some attention to this study; but until the time of Cuvier, the shells of the shell-bearing molluscs received a disproportionate share of attention, and the animals themselves were little regarded. Conchology (q. v.) has now, however, sunk to a very subordinate place, as a mere part of malacology, and this branch of science has been prosecuted during the present century by many eminent naturalists with great zeal and success. The names of Oken, Savigny, De Blainville, Van Beneden, Milne-Edwards, and Owen, perhaps deserve to be particularly mentioned.

MALACOPTERYGII, MALACOPTERI (Gr. *malakos*, soft; and *pteryx*, a wing), or **MALACOPTEROUS FISHES**, one of the two primary divisions of *Osteous Fishes* in the system of Cuvier, distinguished by soft or spineless fins, the rays of which are jointed. Spiny rays are occasionally found in the first dorsal and the pectoral fins. Cuvier subdivided the M. into orders according to the position or absence of the ventral fins; *M. abdominales* having the ventral fins beneath the belly, as the salmon and herring; *M. sub-brachiales* having the ventral fins beneath the shoulder, as the cod and haddock; and *M. apodes* wanting ventral fins, as eels. Müller, however—followed in this by Owen and others—has separated from the M. an order of fishes to which he has given the name of **ANACANTHS** (*Anacanthini*; Gr. *spineless*), differing from acanthopterous fishes merely in the absence of spinous rays in the fins. Among the anacanthi are the important families *Gadidae* (Cod, &c.) and *Pleuronectidae* (Flat-fish).

MALAGA, a city and seaport of Spain, capital of the modern province of the same name, is situated on the shore of the Mediterranean, 70 miles north-east of Gibraltar. Sheltered on the north and east by mountains, and with a climate of which dryness and constant sunshine are the characteristics, this place is superior as a resort for invalids to any other either of France or Italy. Winter, in the English sense, is here almost unknown. M. is purely a place of commerce, and with the exception of some fine Moorish remains, it contains little that can be called artistic. The sea is here receding, and the Moorish dock-yard and quay are now in the town, while the beautiful *Alameda*, or public walk, was covered with water last century. M. is famous for its sweet Muscatel wines, grown on the heights in the vicinity, and the richest of

which are called *Las Lagrimas*. Of the dry wines made here, about 30,000 butts, each about £10 in value, are exported to England and America. In 1860, the exports, consisting chiefly of wines, oil, figs, almonds, grapes, and raisins, amounted to £805,408; and the imports for the same year, consisting of salt-fish, iron manufactures, and colonial produce, amounted to £1,256,249. Besides its legitimate trade and its manufactures of cloth, ropes, leather, soap, &c., M. carries on an extensive smuggling traffic with Gibraltar and Marseille. Pop. 113,050. M., known to the Romans as Malaca, is a very ancient place. It was founded by the Phœnicians, and has enjoyed a commercial existence and a measure of prosperity for 3000 years.

MALAGA, a modern maritime province of Spain, formed out of the ancient kingdom of Granada (q. v.), is bounded on the S. by the Mediterranean, on the E. by the province of Granada, and on the W. by that of Cadiz. Area, 2788 square miles; pop. 451,406.

MALAGUETTA PEPPER. See GRAINS OF PARADISE.

MALAPTERURUS (Gr. *malakos*, soft; *pteron*, a fin; and *oura*, the tail) is the name given to a genus of fishes of the family *Siluridae* (q. v.), in which in place of a true dorsal fin, there is a soft fatty fin near the tail, and to this peculiarity the name is due. Two species are known—viz., *M. electricus* and *M. Beninensis*. See ELECTRICITY, ANIMAL.

MALARIA. See MIASMA.

MALAY APPLE. See EUGENIA.

MALAY ARCHIPELAGO, also called the **INDIAN or EASTERN ARCHIPELAGO** and **MALAISSIA**, by far the largest, if not also the most important island group, or rather system of island groups in the world, stretches in long. from 95° to about 140° E., and in lat. from 19° N. to 11° S. It is bounded on the N. by the China Sea, on the E. by the Pacific, and on the S. and W. by Australia and the Indian Ocean. The principal groups in the Archipelago are the Sunda Islands, in the west, embracing Sumatra, Java, &c.; the Philippines, in the north; and the Moluccas, or Spice Islands, eastward from Celebes. The chief members of the system are Borneo, Sumatra, and Celebes; only the western division of Papua, or New Guinea, is reckoned as forming a portion of the Malay Archipelago. Of these islands, Spain holds the Philippines; Britain possesses the settlements of Penang, Singapore, Labuan, and Malacca; native potentates reign in several; but by far the greater portion of this extensive Archipelago belongs to the Netherlands, and is frequently named the Dutch East Indies. With the exception of the tropical coasts of Brazil, no region produces such a luxuriant magnificence of vegetation as the Malay Archipelago. The heat of the climate is pleasantly tempered by sea-breezes; forests of invaluable timber cover the mountain slopes, and water is abundant.

MALAYS (properly, **MALAYUS**, a Malay word, the derivation of which has not yet been satisfactorily ascertained) is the name given, in a restricted sense, to the inhabitants of the Malay Peninsula, but in its wider acceptation, to a great branch of the human family, dwelling not only in the peninsula mentioned, but in the islands, large and small, of the Indian Archipelago, in Madagascar, and in the numerous islands of the Pacific. In the fivefold division of mankind laid down by Blumenbach, the M. are treated of as a distinct race, while in the threefold division of Latham they are regarded as a branch of the Mongolids. Prichard has subdivided

the various representatives of the Malay family into three branches—viz. (1.) the Indo-Malayan, comprehending the M. proper of Malacca, and the inhabitants of Sumatra, Java, Celebes, the Moluccas, and the Philippines, with whom, perhaps, may be associated the natives of the Caroline Islands and the Ladrões; (2.) the Polynesian; and (3.) the Madagascan, or people of Madagascar. Accepting this subdivision, we shall, in the present article, confine ourselves to the M. proper—the natives of Madagascar having been already noticed under that heading; and reserving the Polynesians generally and the Maoris in particular for distinct articles.

In physical appearance, the M. are a brown-complexioned race, rather darker than the Chinese, but not so swarthy as the Hindus. They have long, black, shining, but coarse hair; little or no beard; a large mouth; eyes large and dark; nose generally short and flat; lips rather thicker than those of Europeans; and cheek-bones high. In stature, the Indo-Malays are for the most part below the middle height, while the Polynesians generally exceed it. The Indo-Malays have also slight, well-formed limbs, and are particularly small about the wrists and ankles. 'The profile,' according to Dr Pickering, 'is usually more vertical than in the white race, but this may be owing in part to the mode of carriage, for the skull does not shew a superior facial angle.' Such is the general appearance of the M. proper, or inhabitants of the peninsula and Indian Islands. But these also have their subdivisions. There are the civilised M., who have a written language, and have made some progress in the arts of life; then there are the sea-people, *orang-laut*, literally, 'men of the sea,' a kind of sea-gipsies or robbers; and there are the *orang banua*, or *orang utan*, 'wild men,' or 'savages,' dwelling in the woods or forests, and supposed to be the aborigines of the peninsula and islands. 'These three classes of Malays,' says Crawford, 'existed nearly three centuries and a half ago, when the Portuguese first arrived in the waters of the Archipelago, just as they do at the present day. That people describes them as having existed also for two centuries and a half before that event, as without doubt, they did in times far earlier.' Still, while so widely differing in habits, all these speak essentially the same language. The M. are essentially islanders, and have much of the daring and enterprise for which nations familiar with the sea are famous. Their original seat is by themselves stated to have been Menangkabo, in the island of Sumatra, rather than the peninsula itself. Even the M. of Borneo claim to have had a Menangkabo origin. Palembang, however, also in Sumatra, has been mentioned as the original seat of Malay civilisation; and others, again, point to Java as the source from which both Menangkabo and Palembang received their first settlers. 'The Javanese,' says Crawford, 'would seem to have been even the founders of Malacca. Monuments, which prove the presence of this people in the country of the Malays, have even been discovered. Thus, Sir Stamford Raffles, when he visited Menangkabo, found there inscriptions on stone in the ancient character of Java, such as are frequent in that island; and he was supported in his conclusion that they were so by the learned natives of Java who accompanied him in his journey.' The settlement of the Javanese in several parts of Sumatra is indeed sufficiently attested. In Palembang, they have been immemorially the ruling people; and although the Malay language be the popular one, the Javanese, in its peculiar written character, is still that of the court. The Malay language is simple and easy in its construction, harmonious in its pronunciation, and easily acquired

by Europeans. It is the *lingua franca* of the Eastern Archipelago. Of its numerous dialects, the Javanese is the most refined, a superiority which it owes to the influence upon it of Sanscrit literature. Many Arabic words have also been incorporated with it, by means of which the Javanese are able to supply the deficiency of scientific terms in their own tongue. In religion, the civilised M. are Mohammedans, having embraced that faith in the 13th or 14th century. The tribes in the interior and the 'men of the sea' have either no religion at all, or such as can be regarded only in the light of most debased superstition. The moral character of the Indo-Malays generally does not stand high: they are passionate, treacherous, and revengeful. Although good sailors, and able to amass wealth by legitimate commerce, they prefer piracy, and numerous have been the victims among European traders to Malay treachery and daring. Indeed, so little faith have Europeans in their professions or engagements, that they will never engage more than two or three of them in a ship's crew, for fear of unpleasant, if not disastrous consequences.

MALCOLM, the name of four kings of Scotland.—M. MacDonald succeeded to the throne on the abdication of Constantine MacAodh in 944 A.D. The most important event of his reign was the cession of Cumbria, in 946, by the English monarch Edmund I. M. was slain while engaged in quelling a revolt in the north of Scotland, in 953 A.D.

M. MacKenneth, grandson of the preceding, ascended the throne in 1003. His life was passed chiefly in repelling the incursions of the Danes. He died in 1033. A collection of laws, the *Leges Malcolmi MacKenneth*, has been attributed to him, but is obviously a work of a later age.

M. MacDuncan, surnamed CAN-MORE (Celtic, *Ocean-mare*, 'Great Head'), was born about the year 1024, and ascended the throne on the death of Macbeth MacFinlegh, in December 1056, or of Lulach MacGilcomgan in April 1057. For the first nine years of his reign, M. was at liberty to devote his energies to the consolidation of his kingdom, England being then ruled by the peaceful Edward the Confessor. After William of Normandy had settled himself on the English throne, many noble Saxons sought refuge at the Scottish court, and among them Edgar Atheling, nearest of kin to the Confessor, with his mother Agatha, and his sisters Margaret and Christina. Margaret, who was young, beautiful, and pious, captivated the heart of the Scottish king, and a marriage quickly followed. Her biographer, Turgot (also her chaplain and confessor), tells us how earnestly and affectionately she laboured to civilise the people and to 'enlighten' her husband. M., although a man of vigorous intellect, could not read her missals and books of devotion, but he used to kiss them in token of reverence, and he caused them to be richly bound, and ornamented with gold and jewels. The retinue of the king began to shew something of a royal magnificence, and his plate was, according to Turgot, 'at least gilt or silvered over.' But M.'s new relations, unfortunately, embroiled him with the Normans. In 1070, he crossed the border, harried Northumberland and Yorkshire, but was soon obliged to retreat. William the Conqueror retaliated in 1072, and wasted Scotland as far as the Tay. At Abernethy, M. was compelled to acknowledge him as his liege lord but (as the Scottish historians hold) only for such parts of his dominions as had belonged to England—viz., Cumbria and the Lothians. War broke out again between England and Scotland on the accession of William Rufus, probably at the instigation of

the fugitive Anglo-Saxons and the discontented Normans, who had been pouring into the country during the iron reign of William, and had obtained large grants of land from the Scottish monarch. Nothing of note, however happened, and peace was again concluded; but the seizure of Carlisle by the English king not long after provoked a fresh rupture, and, in 1093, M. again crossed the border, and laid siege to Alnwick; but while so engaged, he was suddenly attacked, defeated, and slain, November 13, 1093. His wife died immediately on hearing the fatal news.

M., surnamed 'The Maiden,' grandson of David I., succeeded that monarch, 24th May 1153, when only in his 12th year. He had no sooner mounted the throne than a Celtic insurrection, headed by Somerled, Lord of the Isles, broke out. Some years after, another insurrection broke out among 'the wild Scots of Galloway,' under their chief Fergus, to crush which M. had to employ a large force. In 1161, he had to chastise a revolt of the men of Moray, and to put down a second rebellion of Somerled. He died at Jedburgh, of a lingering disease, 9th December 1165, at the early age of twenty-four.

MALCOLM, SIR JOHN, G.C.B., a British statesman and historian, was born at Burnfoot, parish of Westerkirk, Dumfriesshire, May 2, 1769, and at the age of 14 went to India as a cadet in the Madras army. About 1790, he commenced to devote his leisure hours to the study of the Oriental languages, especially Persian. He distinguished himself at the siege of Seringapatam in 1792, and was appointed to the staff as Persian interpreter. In 1800, he was sent as ambassador to Persia, to form an alliance with that country against Bonaparte, in which he succeeded. In 1802, 1807, and 1809, he was again sent as minister-plenipotentiary to the Persian court; and shortly before his final return, received from the Shah the order of the 'Sun and Lion,' and the titles of 'Khan' and 'Sepahdar of the Empire.' In 1803, he had been appointed president of Mysore; and during the two following years, his administrative talents had been of most important service to the government in reducing to order and tranquillity the newly conquered Mahratta states. In 1812, he returned to England, received the honour of knighthood, and, after a lapse of five years, returned to India as the governor-general's political agent in the Deccan, and with the rank of brigadier-general in the Indian army; in the latter capacity, he greatly distinguished himself in the wars against the Pindaris and Holkar. In 1827, he was appointed governor of Bombay, but finally left India in 1830. He died of paralysis at Windsor, May 1833. M.'s writings are highly esteemed as authorities; they are—*A History of Persia* (London, 1815, 2 vols. 4to; 2d ed. 1823); *Memoir of Central India* (2 vols. London, 1823); *Political History of India from 1784 to 1823* (2 vols. 8vo, 1826); and *Life of Lord Clive* (London, 1836), a posthumous work. The *Life and Correspondence* of M. were published by John W. Kaye, in 2 vols. 8vo (London, 1856).

MALDEGEM, a small manufacturing town of Belgium, Great Flanders, 17 miles north-west of Ghent. Population upwards of 6000, who are employed in the manufacture of tobacco, and in brewing and cotton-printing.

MALDIVÉ ISLANDS, a chain of low coral islands, in the Indian Ocean, about 400 miles west-south-west of Ceylon. They extend 500 miles in length by 45 miles in average breadth, and consist of 17 groups or atolls, each atoll surrounded by a coral reef. The entire number, including the islets,

is estimated at about 50,000. Mali, the largest of the chain, and the residence of the native prince, who is called 'The Sultan of the Twelve Thousand Isles,' is seven miles in circumference, and contains a population of 2000. The population of the whole chain is estimated at 200,000. Each island is circular in form, with a lagoon in its centre, and has an elevation above the sea in no case of more than 20 feet at high-water mark. The larger and inhabited islands are clad with palm, fig, citron, and bread-fruit trees. Grain is also abundantly produced. Wild-fowl breed in prodigious numbers; fish, rice (imported from Hindustan), and coconuts, constitute the food of the inhabitants, who are strict Mohammedans. The 'sultan' sends an annual tribute to the governor of Ceylon.

MALDON, a market-town, river-port, and municipal and parliamentary borough of England in the county of Essex, a mile below the confluence of the Chelmer and the Blackwater, and nine miles east of Chelmsford. Besides the manufacture of crystallised salt and silk fabrics, brewing and iron-founding, the usual branches of industry connected with a port, are carried on. In 1862, 1992 (sailing) vessels of 111,098 tons entered and cleared the port. M. returns two members to the House of Commons. Pop. (1861) of municipal borough, 4785.

MALE FERN. See **FERN, MALE**.

MALEBRANCHE, NICOLAS, a French philosopher, born August 6, 1698, at Paris, where his father was President of the Chamber of Accounts. He was deformed and sickly, and from his childhood fond of solitude. At the age of 22, he entered into the congregation of the Oratory, and devoted himself to the study of Bible history and of the Fathers of the church, till Descartes's treatise, *De Homine*, falling into his hands, attracted him to philosophy. His famous work, *De la Recherche de la Vérité* (3 vols. Paris, 1674, and other editions), displaying great depth and originality of thought, combined with perspicuity and elegance, had for its object the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God (his famous *Vision en Dieu*); that all beings and thoughts exist in God (*Dieu est le lieu des esprits, comme l'espace est le lieu des corps*); and that God is the first cause of all changes which take place in bodies and souls, which are therefore merely passive therein. His system is a kind of mystic idealism. It was immediately opposed by Ant. Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Leibnitz. Besides the work above mentioned, M. wrote a *Traité de Morale*, a *Traité de la Communication de Mouvement*, and *Conversations Métaphysiques Chrétiennes*, in the last of which he endeavoured to exhibit the harmony of his philosophic views with Christianity. He died at Paris (as English critics are fond of saying) of a dispute with the subtle Berkeley, October 13, 1715.

MALESHERBES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, a distinguished French statesman, was born at Paris, December 6, 1721, and educated at the Jesuits' College; he became counsellor to the parliament of Paris in 1744, and succeeded his father as President of the Court of Aids in 1750, where his clear judgment, strict integrity, and humane disposition, enabled him to be of great service to his country. A quiet but determined opponent of government rapacity and tyranny, he watched the ministry with a jealous eye, and was indefatigable in his efforts to prevent the people from being plundered. About the same time (1750),

he was appointed censor of the press. This was a most unsuitable office for him, but he appears to have accepted it lest it should fall into the hands of some mere bigot or court-hirer; and so tolerant was he, that French authors pronounce the period of his censorship 'the golden age of letters.' To M. we owe, among other things, the publication of the famous *Encyclopédie*. In 1771, his bold remonstrances against the abuses of law which Louis XV. was perpetrating, led to his banishment to one of his estates. At the accession of Louis XVI. (1774), who esteemed M., he was recalled, and entered Paris in triumph. In 1776, he resigned, on the dismissal of Turgot, all official employment; and from this period on to the Revolution, spent his time in travel, or in the improvement of his estate. The first storms of that wild period passed by and left him unscathed; but when he heard that the unfortunate king, who had always neglected to profit by his advice, was about to be tried by the Convention, he magnanimously left his retreat, and offered to defend his old master. The Convention granted permission, but from that day M. was himself a doomed man. He was arrested in the beginning of December 1793, and guillotined, April 22, 1794, along with his daughter and her husband, M. de Chateaubriand, brother of the famous author of that name. M. was a member of the French Academy, an able writer on political, legal, and financial questions, and one of the most virtuous and high-minded statesmen of the 18th century.

MALIBRAN, MARIA FELICITA, one of the most celebrated mezzo-soprano singers of recent times, born at Paris, March 24, 1808, was the daughter of Manuel Garcia, a Spanish singer and teacher of singing. When she was still very young, her reputation extended over Europe. Her father attempted to establish the Italian opera in New York, but without success; and, on account of his circumstances, she married M. Malibran, a Frenchman, who was supposed to be one of the richest merchants of that city, but who soon became bankrupt, on which she went again upon the stage, and was received with great enthusiasm in France, England, Germany, and Italy. She expended, with remarkable benevolence, the great sums which she won. Her first marriage having been dissolved, she married M. Beriot, a famous violinist, in 1836; but, in September of that year, she died at Manchester, whither she had gone to take part in a musical festival. M. was a woman of noble heart and high intellect, and her conversation possessed an exquisite fascination. She has left a number of musical compositions, some of which are deservedly popular. A memoir of her was published in England shortly after her death, by the Countess of Merlin.

MALIC ACID ($C_4H_4O_5 \cdot 2HO$), so called from *malum*, the Latin word for an apple, occurs abundantly in most acidulous fruits, particularly in various apples, gooseberries, and currants, in which it is found as an acid or super-salt of potash or lime, which gradually changes into a neutral salt as the fruit ripens. It crystallises in groups of radiating acicular prisms, but as the crystals are very deliquescent, it is usually obtained as a syrupy, semi-transparent mass, with a very sour smell, and readily soluble in water and alcohol.

The chemical changes which this acid undergoes under the influence of various reagents are very singular, and serve to illustrate many points in vegetable physiology in reference to the maturation of fruits, &c. Thus, nitric acid converts it into oxalic acid; hydrated potash, into oxalic and acetic acids; ferments, into succinic, butyric, acetic, and

MALIGNANT PUSTULE—MALLOW.

carbonic acids and water. When heated to about 350°, it loses the elements of water, and becomes converted into the two isomeric acids, malonic acid and fumaric acid (q. v.).

Malic acid forms two series of salts with bases, namely, neutral and acid salts. The most characteristic of these salts are the neutral malates of lead and of lime.

MALIGNANT PUSTULE is a contagious and very fatal disease, common in France, where it bears the name of *Charbon*, but of comparatively rare occurrence in England. It begins as a small dark-red, painful spot, on which there soon appears a pustule or vesicle, seated on a hard inflamed base. When this is opened, a black slough becomes apparent. This sloughing spreads rapidly, involving the cellular tissue, and sometimes even the adjacent nucleus.

The disease appears to be caused by infection from horned cattle, which are sometimes affected by a similar disease, but it also arises by inoculation of diseased fluids. It is believed that flies which have alighted on the ulcers of diseased animals may occasionally convey the infection. The constitutional symptoms are much the same as those of putrid typhus fever; while the treatment consists in destroying the diseased surface by powerful caustics, in keeping up the strength by wine, brandy, beef-tea, bark with nitric acid, &c.; and in giving opiates in sufficient doses to relieve the pain during the day and to procure sleep at night.

MALIGNANT TUMOURS. See CANCER and TUMOUR.

MALINES, or **MECHLIN**, one of the chief cities of the Belgian province of Antwerp, 15 miles south-south-east of the city of that name, on the navigable river Dyle. The pop. was, in 1880, 31,271. It has fine squares, noble buildings, and wide regular streets, but is devoid of all signs of life and industry, having lost its former greatness, and fallen far behind all other Belgian cities in commercial enterprise and industrial activity. As the see of the cardinal-primate of Belgium, it still retains a certain degree of ecclesiastical importance, and possesses numerous churches, the most noteworthy of which is the cathedral of St. Romuald, a vast building, covering nearly two acres of ground, and adorned in the interior with many fine pictures and choice carvings. It was built between the 12th and 15th c., but one tower, 345 feet in height, remains unfinished. The other objects most worthy of notice are the churches of St. John and of Our Lady, which contain works by Rubens; the town-hall, dating from the 15th c., and known as the *Beyard*; the Market Hall, an ancient building, with towers, erected in 1340, and now used as a guard-house; the splendid modern archiepiscopal palace; and the monument to Margaret of Austria, erected in 1849. M. has two clerical seminaries, an academy of painting, a gymnasium, and a botanical garden. It still retains some of the important lace manufactories, for which it has been long noted, and manufactures caps and woollen goods, besides having considerable breweries. M. constitutes an important central point of junction for the entire Belgian system of railways.

MALINGERING, a term derived from a similar French word, signifies the feigning of disease, in order to avoid duty. This offence is punished very severely (usually by flogging) in the British army. For further particulars, see FIGNING OF DISEASE.

MALL, or **PALL-MALL** (pr. Pall-Mall), a name given to places in London and other English towns where there were once alleys for playing tennis. See BALL.

MALLEABILITY is the property which certain metals possess of being reducible to thin leaves, either by hammering (hence the corresponding German word, *Hämmerbarkeit*) or by lamination between rollers. The order in which the malleable metals exhibit this property is as follows—Gold, Silver, Copper, Platinum, Palladium, Iron, Aluminium, Tin, Zinc, Lead, Cadmium, Nickel, Cobalt. Gold far surpasses all the other metals in malleability, being capable of reduction into films not exceeding the 200,000th of an inch in thickness; and silver and copper may be reduced to leaves of great tenuity. Although gold and silver also present the property of *Ductility* (q. v.) in the highest degree, there is no constant relation between the two properties; for example, iron, although it may be reduced to extremely thin wire, is not nearly so malleable as gold, silver, or copper.

MALLER'OREE, a family of lamellibranchiate mollusca, regarded by many as a sub-family of *Aviculida* (see PEARL OYSTERS), and of which the typical genus, *Mallor*, is remarkable—in an adult state—for the elongation of the ears of the shell, the other part of which at the same time assumes a curiously elongated, wavy, or crumpled form. The shell thus acquires the name of **HAMMER SHELL**. The species are natives of the East and West Indies and of the South Seas.

MALLOW (*Malva*), a genus of plants of the natural order *Malvaceae*, having a 5-lobed calyx, with an outer calyx of three leaves; stamens cohering in a tube; numerous styles cohering at the base; and numerous one-seeded carpels fixed in a whorl around an axis, and forming a separable orbicular fruit. The species are herbaceous plants, or more rarely shrubs.—The Common M. (*M. sylvestris*) is plentiful over most of Europe, and in Britain on waysides and heaps of rubbish. It is a perennial,

Common Mallow (*Malva sylvestris*).

with rather large bluish-red flowers on erect stalks. The DWARF M. (*M. rotundifolia*), also a common native of Britain, has smaller whitish or reddish-white flowers. These two plants have a mucilaginous and somewhat bitter taste, and the leaves are used as an emollient and demulcent medicine; a decoction of them being employed in cases of irritation of the pulmonary and of the urinary organs; and poultices made of them are very frequently employed to allay external inflammation. Other species have similar properties.—The Musk M. (*M. moschata*), not unfrequent in England, but rare in Scotland, has a faint musk-like smell.—The fibre of *M. crispa* is used in Syria for textile purposes, and the fibres of many species are probably

fit for similar use, and for the manufacture of paper. The young leaves of some are occasionally used as boiled vegetables.—*M. tricuspidata* is used in the West Indies as a substitute for soap; and several species yield dyes.

MALLOW, a market-town and parliamentary borough of Ireland, in the county of Cork, is beautifully situated on the left bank of the Blackwater, 19 miles north-north-west of the county town. On the opposite side of the river, which is here crossed by a bridge of fifteen arches, is the suburb of Ballydahan. The town is resorted to in summer on account of its mineral waters, and contains a neat spa-house. Tanning, brewing, and the manufacture of salt are carried on, together with a good local trade. Pop. (1861) 3612. M. returns one member to the House of Commons.

MALMAG. See **TARSIS**.

MALMESBURY, a market-town and parliamentary borough of England, in the county of Wilts, 20 miles north-north-west of Devizes, and 96 miles west of London. Pop. (1861) of parliamentary borough, 6881. It returns one member to the House of Commons.

M. is a very ancient and interesting town. Here, according to William of Malmesbury, a monastery was founded before the year 670. The abbey afterwards became a cloth-factory. The remains of the abbey-church, partly early Norman, and partly decorated English, may still be seen. There are several other relics of antiquity in the place.

MALMESBURY, WILLIAM OF, an early English historian, was born near the close of the 11th c., probably in Somersetshire, educated in the monastery whence he derived his name, and of which he became librarian. He died some time after 1142, but the exact date is not known. M.'s principal works, which are written in Latin, are *De Gestis Regum*, a history of the kings of England from the Saxon invasion to the 26th year of Henry I.; *Historia Novella*, extending from the 26th year of Henry I. to the escape of the Empress Maud from Oxford; and *De Gestis Pontificum*, containing an account of the bishops and principal monasteries of England from the conversion of Ethelbert of Kent by St Augustine to 1123. The first of these was translated into English by the Rev. John Sharpe (Lond. 1815), and has been reprinted in Bohn's Antiquarian Library, under the editorship of Dr Giles (1847). Of his other works, Gale has printed his *Antiquities of Glastonbury*, and Wharton his *Life of St Wulfstan*, in his *Anglia Sacra*. M. gives proof in his writings of great diligence, good sense, modesty, and a genuine love of truth. His style is much above that of his contemporaries.

MALMÖE, the principal town of the 'län,' or district, of Malmöhus, in Sweden, is situated on the Sound, nearly opposite Copenhagen, and had, in 1860, a population of 18,919. M. is a busy seaport, maintaining an active steam and sailing communication with Copenhagen and all the great Baltic and German Ocean ports, and has manufactures of stockings, tobacco, soap, sugar, woollen goods, &c. It is the seat of a governmental department, and is a lively, pleasantly situated town. The ancient fortifications, most of which are now converted into public walks, date from the time of Eric of Pomerania, who, in 1434, erected strong lines of defence on the sea-side of the town, and built the castle, which still remains. M. was an important place of landing and embarkation as early as 1259, and through the middle ages it was extensively visited by German and other traders. In 1523, it was the scene of the signing of a treaty of peace between the Danes and Gustavus Vasa.

MALMSEY (Malvasian Wine; Fr. *vin de Malvoisie*), a name originally bestowed on the red and white wines of Napoli di Malvasia, in the Morea, and afterwards on similar wines produced in Cyprus, Candia, and other islands of the Archipelago. Malmsey wines are of a luscious sweetness, and have a most peculiar bouquet. The Malmsey wines of commerce are mostly the produce of Teneriffe, the Madeiras, the Azores, the Lipari Isles, Sardinia, Sicily, and Provence. Malmsey is made from grapes grown on rocky ground, fully exposed to the sun, and left to hang on the vines for a month longer than those used to make dry wines, by which time they are partially withered.

MALONE, EDMOND, one of the most respectable editors of Shakespeare, was born in Dublin, 4th October 1741, and educated at the university of that city, where he won a high reputation as a scholar, and took the degree of B.A. In 1757, he was called to the Irish bar; but soon after becoming possessed of a considerable fortune, he went to London, and devoted himself to literary pursuits. His first appearance as an author was in 1780, when he published 2 vols. supplementary to Steevens's edition of Shakespeare (1778). His next achievement—though in this he was only one of several—was exposing the splendid forgeries of Chatterton. He also contributed some notes to Steevens's third edition of Shakespeare, published in 1785, in which he occasionally controverted the opinions of the editor. This led to a serious quarrel between the two, in which Steevens was wholly to blame. M.'s own edition of the great dramatist (1790) was warmly received. The essays on the *History of the Stage*, and on the *Genuineness of the Three Plays of Henry VI.*, have been praised in an especial manner. In this work, M. displays extreme good sense, much acuteness, extensive research, and a becoming respect for the text of the earlier editions. In 1796, he again signalled himself as a literary detective by exposing the Shakspearian forgeries of the Irelanders. In 1797, he published a posthumous edition of the works of his friend Sir Joshua Reynolds. His death took place 25th May 1812. He left behind him a large quantity of materials for another edition of Shakespeare, which appeared in 1821, in 21 vols., under the editorship of Mr James Boswell. See *Life of Edmund Malone, with Selections from his Manuscript Anecdotes*, by Sir James Prior (Lond. 1860).

MALPIGHI, MARCELLO, an eminent Italian anatomist, was born near Bologna in 1628, and died at Rome in 1694. He held, at different periods of his life, the professorship of medicine in Bologna, Pisa, and Messina. In 1691, he was summoned to Rome, and appointed chief physician and chamberlain to Pope Innocent XII.

He is now chiefly known for his discoveries in the anatomy of the skin, of the kidney, and of the spleen; and although the so-called *rete Malpighii* of the skin is no longer regarded as a special structure, the *Malpighian bodies* or *corpuscles* of the kidney and the spleen still retain the name of their discoverer. He is also remarkable as being the first who examined the circulation with the microscope, and thus discovered the blood corpuscles. Amongst his most important works may be mentioned *De Formatione Pulli in Ovo*; *De Cerebro*; *De Lingua*; *De Extrinsecis Tactibus Organo*; *De Structura Viscerum*; *De Pilonibus*; and *De Structura Glandularum Cerebrorum*. His *Opera Posthuma* were edited by Petrus Regis of Montpellier; they contain a history of his discoveries and controversies, together with numerous autobiographical details.

MALPIGHIAEÆ, a natural order of exogenous plants; trees, or shrubs, many of them climbing shrubs or lianas. They often exhibit an anomalous formation of the stem, great part of the woody matter being deposited in lobed zoneless ribs. The leaves are simple, generally with glands on the stalks or under-side. The calyx is 5-partite, generally with very large glands; the corolla of five petals convolute in bud; the stamens generally ten, often monadelphous, a fleshy connective projecting beyond the anthers. There are about 600 known species, natives of tropical countries, and chiefly of South America, many of them having gaudy flowers. A few produce timber of a bright yellow colour. The bark of some species of the genus *Byrsonima* is astringent and medicinal, and at one time attracted considerable attention as a remedy for pulmonary consumption. It is known as *Akorogue Bark*. The fruit of some, as the *BARBADOS CHERRY* (q. v.), is pleasant.

MALPLAQUET, a village (pop. 400) in the department of Nord, France, 20 miles east of Valenciennes, and close to the Belgian frontier, is celebrated for the bloody defeat of the French, under Marshal Villars, by the British and Dutch, commanded by the Duke of Marlborough and Prince Eugene, 11th September 1709. The forces engaged consisted of more than 200,000 men, the allies having a slight superiority in numbers; and the loss on each side amounted to about 20,000 men, the French losing also many standards and cannon. Marshal Villars was severely wounded early in the engagement, and the command devolved upon the old Marshal de Bouffiers, in whose hands the battle degenerated into a mere butchery. The immediate result of the conflict was the capture of Mons.

MALSTRÖM, or **MOSKÖESTROM** ('whirling stream'), the most famous whirlpool in the world, is situated on the Norwegian coast, between Moskøe and Moskenk, two of the Loffoden (q. v.) Isles. The tremendous current that rushes between the Great West Fjord and the outer ocean through the channels between the Loffoden Isles, creates many other dangerous currents, such as the Galström, Napetröm, &c.; but these are not to be compared with the famous Malström. The current runs for six hours from north to south, and then six hours from south to north, producing immense whirls. The depth of the water has been ascertained to be about 20 fathoms, while immediately to the west of the straits the soundings are from 100 to 200 fathoms. The whirlpool is greatest at high or low water; and when the wind blows directly against the current, it becomes extremely dangerous, the whole sea for several miles around being so violently agitated that no boat can live in it for a moment. In ordinary circumstances, it may be traversed even across the centre without apprehension. The stories of ships, whales, &c., being swallowed up in the vortex, are simply fables; at the same time, there can be no doubt that a ship, once fairly under the influence of the current, would certainly either founder or be dashed upon the rocks, and whales have often been found stranded on the Flagstad coast from the same cause.

MALT AND MALTING. See **BEER**.

MALT REFUSE, or **MALT WASTE**, is of two kinds; (1.) the *cornings* or small shoots and radicles of the germinated grain, which are separated before the malt is used by the brewer, often called *Malt Dust* and *Kün Dust*; and (2.) the exhausted malt, after it has been used by the brewer, called *Draff*. Both are of use for the feeding of cattle, but the first kind is the most nutritious, being rich in nitrogenous substances which the brewer extracts

from the malt used by him; draff, however, is advantageously employed, along with turnips, for the feeding of dairy cattle. Malt Dust is also used as a manure, chiefly as a top dressing, and is very fertilising and rapid in its effect.

MALTA, an island and British possession in the Mediterranean, 17 miles long by about 9 broad, with an area of about 95 square miles: it is of carbonaceous limestone, of the tertiary aqueous formation, and occupies a very central position in the Mediterranean Sea, being distant some 54 miles from the Sicilian coast, and about 200 from Cape Bon on the African coast. From its position, and also from the enormous strength of the fortifications, M. is a possession of immense value to any commercial nation which possesses a navy strong enough to prevent it being blockaded. It happens, consequently, that M. is one of the most important, after India, of the British dependencies, for it is not in any sense a colony. Possessing one of the most splendid harbours in the world, with such an even depth that the largest vessels may anchor alongside the very shore, the island forms at once an admirable station for a fleet to command the Mediterranean—a military focus, where a force protecting the route to Egypt and India can be concentrated—and a useful entrepôt for receiving the manufactures of Britain, which the small craft of the Mediterranean carry to every point on the shore of that inland sea and its tributaries. By whomsoever possessed, M. has always been held in high estimation. Between it and Gozzo, or Gozo (q. v.), lies the small island of Comino; and off this last, the still smaller islet, Cominotto, rears its rocky crest, while elsewhere round the shores of M. and Gozo, a few rocks stud the sea, sustaining each a few fishermen, and affording herbage for goats on their moss-grown summits; among these are Filifa, with a venerable church; Pietro Nero, or Black Rock; Scoglio Marfo, Salmonetta, and the *Hagira tal general*, or Fungus Rock, where grows the famed *Fungus medienis* (see **CYNOMORIUM**). M. and Gozo, with their adjacent islets, form together a compact little realm, celebrated in history, possessing a magnificent capital in Valetta, and, from the fact that, owing to peculiar circumstances, vast contributions came to M. from all Catholic Europe, adorned with public buildings, institutions, and works out of all proportion to its actual intrinsic importance.

In physical conformation, M. is comparatively low, its highest point not exceeding 590 feet above the sea-level. The surface is diversified by a succession of hill and dale, the land being intersected by parallel valleys, running from south-west to north-east, the most considerable of which is the vale called Melleha. Across the island stretch the Ben-jemma hills or crags, and many spurs branch from them, which give a picturesqueness to the scenery. From the spongy nature of the limestone of which the island is composed, much of the rain falling in the wet season soaks in, and being evaporated through the thin alluvial covering by the heats of summer, keeps the ground moist, and gives it a fertility which could not otherwise be expected from so scanty and comparatively poor a soil, although its productiveness must also be attributed to the quantity of carbonate of lime held in a minutely divided state above the entire face of the rock.

M. shows no signs of volcanic formation; but the action of the sea among its cliffs has hollowed out grottoes and caverns in almost every direction, and some of considerable extent. The inhabitants are industrious, and good agriculturists, and, by the returns for 1860, had 35,007 acres in M., 9562 in Gozo, and 66 in Comino, under crops, comprising wheat, barley, beans, cotton,

sesamum, cumin, and grass; while the three islands together maintained 22,392 head of live-stock, of which 5756 were horned cattle. On the whole, about the quantity of superior kinds of grain consumed is raised on the islands, and of inferior sorts a considerable amount is exported. Mules and asses are remarkable in M. for their strength and beauty, but horned cattle are small. Maltese goats are fine animals. The birds, which either make the island their permanent home, or migrate thither at special seasons, are renowned for their splendid plumage; and, lastly, the bees produce an aromatic honey, excelled in no other locality. The vegetable products comprise all that flourish in Italy, as aloe, oranges, and olives, with many plants of a more tropical growth.

Medina, the former capital of the island, now known as Citta Vecchia, or Notabile, is a handsome old town, lying inland; it contains the ancient palace of the Grand Masters of the order of St John, the cathedral, a college, and is still the seat of the bishopric. Pop. 7000. Its rival and successor is Valetta (q. v.). The numerous *casals* or villages scattered throughout M. and Gozo are neatly built, and generally present an aspect of industry and frugal happiness.

It is thought by some that M. was the *Hyperion* or *Ogygia* of Homer, but there is little doubt that the Phœnicians colonised the island at a very early date, probably in the 16th c. b.c. Before they were dispossessed by the Greeks in 736 a.c., they had developed considerable commerce. The Greeks called the island *Melita*, and were driven out by the Carthaginians about 500 a.c. As early as the first Punic war, it was plundered by the Romans, but did not come finally into their possession until 242 b.c. They valued it highly, on account of its use as a commercial entrepôt; and also for its cotton and linen cloths, fabrics then, as now, manufactured of wonderful fineness by the Maltese. The island remained under its old laws, governed by a prætor, subject to the prætor of Sicily. On the north coast is the Port of St Paul, and here tradition fixes the wreck of the ship carrying that apostle to Rome. On the division of the Empire, M. followed the fortunes of the eastern division. During the 5th c., it fell successively under the Vandals and Goths, whose barbarism nearly annihilated its commerce.

In 533, Belisarius recovered M. to the Byzantine empire, in nominal union with which it remained for more than three centuries; but its prosperity had departed, and its civilisation almost vanished amid constant local feuds. In 870, the Arabs destroyed the Greek power in M., and fortified the harbour as a station for their corsairs. Count Roger, of Sicily, drove out the Arabs in 1090, and established a popular council for the government of the island, composed of nobles, clergy, and elected representatives of the people. This council, in a more or less modified form, subsisted for 700 years. Under a marriage-contract, M. passed to the German emperor, who constituted it a marquise, but it had ceased to be a place of trade, and was merely a garrison of more expense than value. Charles of Anjou, after overrunning Sicily, made himself master of M., which clung to the French even after they had been expelled from Sicily; but after a time the Houses of Aragon and Castile successively held the island. Subsequently, the Emperor Charles V. took possession of M., and, in 1530, granted it, with Gozo and Tripoli, in perpetual sovereignty to the Knights of the order of St John of Jerusalem, from whom the Turks had recently captured their great stronghold at Rhodes. The Knights raised by degrees the stupendous fortifications which render M. so powerful, and, moreover,

spent their large income in beautifying the island in every way. Meanwhile, they rendered incessant services to Christendom in the chastisement of the ferocious Barbary pirates. To revenge these acts, the Turks brought immense forces against M. in 1557, and again in 1565. The latter siege was carried on by the Sultan Solymán himself, with the flower of the Ottoman army; but the Grand Master La Valette opposed a heroic resistance, and he was forced to re-embark with the loss of more than 25,000 of his best troops. The defenders lost 280 knights and 7000 Maltese soldiers; and their gallantry was the theme of admiration throughout the world. After this siege the Knights built Valetta. In 1571, they, with the Maltese, behaved most courageously at the battle of Lepanto, where the Turks lost 30,000 men. Though waging perpetual war with the Moslem, the knights continued in possession of M. until 1798, when overcome by Bonaparte's treachery, and disorganised by internal quarrels, the order surrendered their noble fortresses to the French. After pillage and infamous treatment by the republican forces, the Maltese rose in a few months against their oppressors, and after a siege of two years, British auxiliaries arriving, the French garrison of Valetta capitulated to the English general Pigot. The treaty of Amiens stipulated that M. should be restored to the Knights of St John; but the Maltese loudly protested against such an arrangement, and preferred the peaceful government of Great Britain. The British government consequently refused to make the transfer, appreciating also, doubtless, the vast value of their new possession, and Napoleon made the refusal one of his grounds for the resumption of hostilities. The Congress of Vienna recognised M. as a British dependency, the condition in which it has since remained.

In 1860, M. and Gozo, with the adjacent islands, together contained 139,842 inhabitants (including 1118 British residents, and 1064 foreigners, but excluding the military, who numbered 7841). The population was increasing rapidly, but the annual rate of increase had declined from 1858. The upper classes speak Italian, but the real language of the people is a patois compounded from many sources, as must be expected from so chequered a history. Arabic, however, so far predominates that the Maltese find little difficulty in communicating with the Barbary peasants. It is alleged by some that the Maltese language—if its Italian and German elements were eliminated—would remain almost pure Punic, and would accurately represent the speech of Carthage at the time of its destruction. The religion of the people is strictly Roman Catholic, and, considering that the British flag waves over the island, but a scanty toleration is granted to other forms of faith. There are good provisions for education; a college at Valetta, where degrees are conferred in divinity, law, and physic; 54 public schools, with 6497 pupils, besides 114 private places for education. There is also an excellent public library, free to all.

The commandant of the garrison is governor, and is aided in the civil government by a council of 16 members, of whom 8 are officials, and 8 are freely elected. The revenue amounted, in 1860, to £145,944; but was exceeded by the expenditure, £148,303. Customs and excise, with a few assessed taxes, provide the former; the latter is absorbed in the charges of the civil government, and in a contribution of £6200 towards the military expenditure. On the other hand, Great Britain maintains a considerable force in the islands, mainly for imperial purposes, at a cost of £331,000 a year. Besides a large body of British artillery,

the garrison includes the Royal Malta Fencible Artillery, a fine native regiment of 630 officers and men. There is an extensive arsenal, and a very important dock-yard, M. being the head-quarters of the British fleet in the Mediterranean. Taken altogether, M. is a possession the British highly value; it is nearly, if not quite, as strong as Gibraltar, and far more useful.

The public debt amounted, in 1880, to £146,422, at a very low rate of interest. In the same year, the shipping belonging to the islands numbered 105 boats, of 22,825 tons; 3187 vessels, of 410,919 tons entered, and 2226 vessels, of 416,477 tons, cleared; of which about one-third were British bottoms; and of the foreign tonnage, about two-fifths belonged to the kingdom of Italy. The imports were valued at £2,881,547, and the exports at £2,300,021, corn on duty from Russia for the United Kingdom figuring very largely in the transactions.

MALTA, KNIGHTS OF. See JOHN, St. OF JERUSALEM, KNIGHTS OF.

MALTEBRUN, KONRAD (properly, **MALTEBRUN, KONRAD**), an eminent geographer, born 12th August 1778, at Thisted, in Jutland, studied in Copenhagen, and at the outbreak of the French Revolution, embraced with great ardour the liberal cause, so that long persecuted upon account of political publications, he was twice obliged to flee from Denmark, and finally, in 1800, was condemned to perpetual banishment from his native country. He sought refuge in Paris, where he maintained himself by teaching and literary labours. In 1806, he began the *Annales des Voyages, de la Géographie et de l'Histoire* (24 vols.), which he concluded in 1814. In 1818, he began, along with Cyrinus, the *Nouvelles Annales*, &c. He devoted his pen to the support of Napoleon during his reign, and in 1815 became connected with an ultra-royalist journal, and a defender of the theory of legitimacy adopted by the Congress of Vienna. His principal work is his *Précis de la Géographie* (18 vols. Par. 1824—1828, with an atlas). He took part also in the *Dictionnaire Géographique* (8 vols. Par. 1821), and was Secretary to the Geographical Society of Paris. He died 14th December 1835.—His son, **VICTOR ADOLPHE M.** (born 1816) is one of the most eminent living geographers of France, and has succeeded his father as Secretary of the Geographical Society of Paris.

MALTESE CROSS, a cross of eight points, of the form worn as a decoration by the Hospitallers (q. v.) and other orders of knighthood.

MALTESE DOG, a small kind of spaniel, with

lapdog; but is a very ancient breed, being figured on Roman monuments, and noticed by Strabo.

MALTHUS, THOMAS ROBERT, the founder of those opinions concerning the relation of population to the means of subsistence which have been named after him 'Malthusian,' was born in the county of Surrey, in the year 1768. He was well connected, and graduated with honours in 1788, at Jesus College, Cambridge, of which he became a Fellow. He became soon after clergyman of a small parish in his native county, and divided his time between his cure and the university libraries. In 1790, he left Britain to see foreign countries, along with the eminent traveller, Daniel Clarke. The great European war was then raging, and the most interesting portions of the continent of Europe were closed to our countrymen. M., however, with an evidently keen anxiety to observe mankind under a variety of conditions, wandered through Sweden, Norway, Finland, and part of Russia, making notes of what he observed. Next year, he took advantage of the short Peace of Amiens to visit France and other portions of Central Europe. These efforts to become acquainted with mankind are significant ones. Although M. has the reputation of being a bold theorist, the charm of his writings consists in his practical knowledge of how men have existed and acted in various parts of the world and under diverse conditions, and his knowledge of actual human nature—his sagacity and accuracy, in short, in the details which he brought to bear on his great theory—were in a considerable measure the source of the great influence exercised by him over public opinion, and had the secondary effect of making his books readable even to those who made war on his conclusions. It was in 1798 that he first published his *Essay on the Principles of Population as it affects the Future Improvement of Society*; but in subsequent editions he so greatly enlarged and enriched the work, that it could hardly be identified with the first impression. The predominant idea of the book was evidently suggested by Hume's essay on the populoseness of ancient nations, in which vague statements as to vast multitudes of human beings subsisting in any place, or wandering from place to place, are brought to the test of the means of subsistence at their disposal. Where there is an accurate census, the number of people living on the portion of the globe covered by it, is, of course, known to within a trifle of the truth. Such arrangements for accuracy have, however, been extremely rare in the history of the world. Where they are absent, egregious exaggerations have been made in estimates of the numbers of mankind; and in the absence of absolute facts, the best means of reducing these wild estimates to something reasonable was the sceptical philosopher's plan of comparing the estimate of the numbers with the probable amount of food at their disposal. The application of this check by M. was something like the application of chemistry to organic matter. He set himself to finding out how the relation of population to the means of subsistence could affect the future of the world. The result was appalling. The human race was found to increase at something like geometrical progression; while the fertility of land, by bringing in waste, and improving the methods of agriculture, only increased in something like an arithmetical proportion. Hence, if population were permitted to increase at its natural rate, it would soon overtake the means of subsistence. The theory had only one defect as applicable to the present condition of the world, that it overlooked the element of free trade. It involved a general pauperism to Britain if her people had no resources but the produce of her soil, but it made no allowance for the

Maltese Dog (Cane familiaris).

remains mounds, and long, silky, generally white hair. It is altogether useless, and fit only for a

capacity of Britain to draw upon the fertility of the world at large. M. wrote other books, which got little notice in their day, and have been forgotten. He was appointed Professor of Political Economy at the college of Haileybury in 1805. He filled his chair with great repute until his death, on the 29th of December 1836.

MALTON, a parliamentary borough and market-town in the North Riding of Yorkshire, on an elevation on the right bank of the Derwent, 18 miles north-east of York. The parliamentary borough includes the parishes of Old Malton and Norton, to the former of which a grammar-school, founded in 1547, and having an annual endowment of £100 a year, is attached. There are also the remains of a priory, founded in 1150. Considerable trade is carried on. Pop. (1861) of parliamentary borough, which returns two members to parliament, 8072.

M., called by the Romans *Camulodunum*, abbreviated by the Saxons into *Meldun*, was an important Roman military station, to which six ancient roads lead. After having been burned down, the town was rebuilt in the reign of Stephen, since which time it has been generally called New Malton.

MALURUS, a genus of Australian birds, giving its name to a large subdivision of the family *Sylviidae*, in which are contained many Asiatic and African species, and some that are natives of the south of Europe. They have generally a long tail; in some, very long, as in the EMEU WREN of Australia, in which it is more than twice the length of the body, the shafts of its feathers loosely fringed on each side. The Emeu Wren (*Stipiturus malachurus*) is a very pretty little bird, living chiefly among long grass. One of the most noted *Maluri* is *M. cyaneus*, the BLUE WREN or SUPERB WARBLER of Australia, which is gorgeously attired in black, blue, white, and brown. It haunts scrubby brushwood.

MALVA'CEÆ, a natural order of exogenous plants, of which about 1000 species are known, chiefly tropical, and most abundant in America, although the most important species belong to the Old World. They are herbaceous plants, shrubs, and occasionally in tropical countries trees; with alternate entire or lobed leaves; the pubescence, if any, starry; the flowers showy, generally on axillary stalks; the calyx generally of five sepals or five segments, often with an epicalyx; the petals generally five, hypogynous, twisted in bud; the stamens numerous, united by their filaments; the ovary consisting of a number of carpels around a common axis, the styles generally five, the ovules few or many; the fruit dry or fleshy. The plants of this order have a great general similarity both in their appearance and in their properties and products. All of them contain a mucilaginous substance in great quantity, which is particularly abundant in the roots of the perennial herbaceous species. This mucilaginous quality makes some very useful as emollients and demulcents in medicine. The young foliage of some is used as a boiled vegetable. The seeds of all contain a considerable quantity of bland fixed oil. The inner bark of the stem often yields a useful fibre, for which species of *Hibiscus* and *Sida* are particularly valued; and to this order belong the Cotton plants, so valuable for the fibre which envelops their seeds. Many of them are frequent ornaments of flower-gardens.—See COTTON, HIBISCUS, HOLLYHOCK, MALLOW, MARSH-MALLOW, SIDA, and URENA.

MALVERN, GREAT, a town and watering-place in Worcestershire, England, picturesquely situated on the eastern side of the Malvern Hills, 8 miles south-west of Worcester. The purity and abundance of the spring-water, and the facilities for healthful

exercise afforded by the hills, have rendered Malvern a great resort for invalids following the hydropathic treatment, for which there are several large establishments. Pop. (1861) 4484.

MA'LWA, a former kingdom of India, lying in the most part north of the Nerbudda, and south-west of the valley of the Ganges, is an uneven plateau varying from 1500 to 2500 feet above sea-level. It is now divided into a number of protected states.

MA'MELUKES, MAMLOUKS, or MEN-LOOKS, an Arabic word signifying *slaves*, the name given in Egypt to the slaves of the bey, brought from the Caucasus, and who formed their armed force. When Genghis Khan desolated great part of Asia in the 13th c., and carried away a multitude of the inhabitants for slaves, the Sultans of Egypt bought 12,000 of them, partly Mingielias and Tcherkessies, but mostly Turks, and formed them into a body of troops. But they soon found their own power so great that, in 1254, they made use of their own number Sultan of Egypt, founding the dynasty of the Baharites, which gave place to another Mameluke dynasty, that of the Borjites, in 1382. The Caucasian element predominated in the first dynasty, the Tartar element in the second. In general, they formed able and energetic rulers, and Egypt under their sway arrived at a degree of prosperity and power to which she had been a stranger from the days of Sesostris. Selim I. overthrew the Mameluke kingdom in 1517, was compelled to permit the continuance of the twenty-four Mameluke beys as governors of the provinces. This arrangement subsisted till the middle of the 18th c., when the number and wealth of the M. gave them such a preponderance of power in Egypt that the pasha named by the Porte was reduced to a merely nominal ruler. The number of them scattered throughout all Egypt was between 10,000 and 12,000 men. Their number was kept up chiefly by slaves brought from the Caucasus, from among whom the beys and other officers of state were exclusively chosen. Their last brilliant achievements were on the occasion of the French invasion of Egypt, and during the time immediately following the retirement of the French. At this time, Murad Bey stood at their head. But in 1811 they were foully massacred by Mohammed Ali (q. v.), afterwards Viceroy of Egypt.

MAMERS, a small town of France, in the department of Sarthe, 25 miles north-north-east of Le Mans. Coarse linens, calico, beer, and leather are manufactured. Pop. about 5800.

MAMIANI, COUNT TRENZIO, an Italian philosopher, statesman, and writer, born in 1801, at Pesaro. Having taken a prominent part in the futile revolutionary outbreak which accompanied the accession of Gregory XVI., M. was compelled to seek safety in flight, and repaired to Paris, from whence he promoted with energy the revolutionary tendencies of his country. In 1846, on the accession of Pius IX. he declined the proffered papal amnesty, as long as its acceptance involved a disavowal of his former political principles; but on its being unconditionally granted, he availed himself of it, and even formed part of the papal ministry on the promulgation of the constitution. The inconsistent policy of the pope having compelled him to resign his post, he withdrew to Turin, where he founded, with Gioberti, a society for promoting the union of Italians. On the flight of Pius IX. from Rome to Gaeta, he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Galetti. On the fall of Rome, he retired to Genoa; in 1856, he was returned member of the Sardinian parliament, and in 1860 entered Cavour's ministry as Minister

of instruction. He has gained distinction in philology, poetry, oratory, and jurisprudence. His chief works are: *Del Rinascimento della Filosofia antica Italiana* (1836); *Poeti dell' età Media* (1842); *Dell' ontologia e del Metodo*; *Principi della Filosofia del Diritto*, and a number of treatises on various subjects. A complete edition of his poetical works has been published by Le Monnier (Florence, 1857).

MAMMALIA (Lat. *mamma*, the breast), the highest class of the animal sub-kingdom *Vertebrata* (q. v.). This class includes Man and all the animals which resemble him in the most important points of their organisation; and it is naturally placed at the head of the animal kingdom, because (independently of Man being a member of it) it contains the animals which manifest the highest degree of intelligence, and which possess the most complex organisation.

The most distinctive character of the mammalia is their mode of development and of nourishment during the earliest period of life. They are all brought into the world alive (viviparous), not merely, as in certain (ovo-viviparous) reptiles and fishes, by the retention and hatching of the egg within the ovoduct, but by the formation of a new connection between the embryo and its mother, while the former lies within the maternal cavities, so that provision is made for its development before birth, not, as in birds, &c., by the large yolk (see DEVELOPMENT OF THE EMBRYO), but by a constant supply of nutriment direct from the maternal blood. In mammals, the ovum, on quitting the ovary, is of extremely minute size, and the materials of the yolk only serve to support the embryo during its very earliest period. After undergoing certain changes in the passage through the Fallopian tube or oviduct, which it is unnecessary here to notice, the ovum reaches the uterus or womb, and connects itself by a set of root-like tufts of vessels with the maternal vessels. These

tufts absorb from the mother's blood the ingredients necessary for the support of the embryo, while they convey back to it the effete particles of the embryonic tissues. Through this organ, which simultaneously increases in size with the embryo, and is named the placenta, the young animal, except in the lowest orders of the class—viz., the Marsupialia (q. v.) and the Monotremata (q. v.)—derives its nutriment during the whole period of Gestation (q. v.); while in the two orders just named, no vascular connection of the ovum with the uterus of the mother is formed, the ovum being simply retained for a time within the uterus, and the requisite nourishment for the development of the young animal being obtained by absorption through the membranes of the ovum. This remarkable difference in the development of the

mammalian embryo has given rise to a division of this class into two great sections or sub-classes—the *Placental* and the *Implacental* (or *Aplacental*) mammals. In both sub-classes, we find the same provision for nourishing the animal during the

period immediately succeeding its birth—viz., the Milk (q. v.), a fluid secreted by peculiar glands, called the *mammary glands*, which become greatly developed in the female during the periods of gestation and lactation; and as this is found in no other class, it is the character by which the entire group is most positively defined, and from which it derives its name.

The mammary glands exist in both sexes, but except in very rare cases, it is only in the female that they secrete milk. Their number is never less than two, and when more, is generally nearly proportional to that of the young produced at each birth. In the monkeys, the elephant, the goat, the mare, &c., there are two; in the cow, stag, and lion, four; in the cat, eight; in the rabbit, ten; in the pig, generally twelve; and in the rat, ten or twelve. These glands are often blended together, as in the cow; and their number is then indicated externally by that of the nipples or teats. Their position also varies: in the monkeys and bats, and in the herbivorous Cetacea, they are situated on the thorax, as in man; in most of the carnivorous animals, they are situated on the abdomen as well as on the thorax; while in the mare, cow, sheep, &c., they are placed still further back, near the hip-joint.

The skin in the greater number of mammalia is covered with hair, a form of tegumentary appendage peculiarly characteristic of this class. In the Cetacea, however, we have an almost entire absence of hair; one of its uses—that of keeping the heat within the body—being here provided for by the thickening of the skin and the deposition of the blubber beneath it. In the Edentata, the hairy covering is almost entirely replaced by horny scales, as in the scaly ant-eater, or by bony plates, as in the armadillo. In the quills of the porcupine and the spiny bristles of the hedgehog, we have other modifications of hair which depart less

Fig. 1.—Skeleton of the Camel:

cc, cervical vertebrae; cd, dorsal vertebrae; sl, lumbar vertebrae; sa, sacral vertebrae; ca, caudal vertebrae; r, ribs; sc, scapula; A, humerus; ca, bone of forearm (radius and ulna fused together); cw, carpus, or wrist-bones; me, metacarpus; ph, phalanges; fe, femur; ro, patella; ti, tibia; ta, tarsus; mt, metatarsus.

from its ordinary character than those just mentioned. Moreover, the claws, nails, and hoofs of all mammals, the horn or horns on the nose of the rhinoceros, and the horns of the hollow-horned ruminants (such as the ox, sheep, &c.), are all

composed of a substance which is only a modification of hair.

The *skeleton*, as a general rule, governs the general form of the body. In its general conformation, it shows a close analogy with that of man, which is described in the article *SKELETON*; the differences which are remarked amongst the various animals of this class mainly depending (1) upon the absence of posterior limbs in the marine mammals, such as the dugong, the porpoise, and the whale; (2) upon the diminished number of digits (see *HAND* and *FOOT*), and upon the absence of the clavicle in the greater number of those species whose anterior limbs serve only for motion; (3) upon variations in the number of vertebrae; and (4) upon the inequalities in the relative sizes of the same bones (Milne-Edwards).

Although the same bones enter into the formation of every mammalian skull, great differences present themselves in different skulls, according as the face is more or less prolonged, or, on the other hand, the brain-case or cranium is more or less developed. In proportion as a mammal is removed in classification from man, we find that the cranium is diminished; that the face is prolonged by extension of the jaws and nasal cavities; that the orbits are directed outwards, and are less distinct from the temporal fossae; and that the occipital foramen (through which the spinal cord passes) and the condyles (by which the head articulates with the first vertebra of the spinal column) are placed towards the posterior part of the skull, instead of occupying the middle of its inferior surface, as in man. Amongst the most characteristic points in the mammalian skull generally, may be mentioned (1), that the lower jaw articulates directly with the skull, there being no intervening tympanic bone, such as occurs in the other vertebrates; and (2) that the occipital bone of the skull articulates with the first vertebra by two condyles, one on either side of the occipital foramen, instead of by a single condyle, as in the other vertebrates.

The *vertebral column*, except in relation to its length, closely resembles that in man, where there are 7 cervical, 12 dorsal, 5 lumbar, 5 sacral, and 5 caudal vertebrae. The *cervical vertebrae* are almost universally 7 in number, however long or short the neck may be, the only known exceptions being two cetaceans (*Manetus* and *Rytina*), which have 6, and the three-toed sloth, which has 9. The number of *dorsal vertebrae* ranges from 11 to 23, which latter number occurs in the two-toed sloth. The *lumbar vertebrae* range from 2 to 9, the most common number being 5. The *sacral vertebrae*, which coalesce to form the sacrum and to support the pelvic arch, vary from 2 (in the Monotremata and Marsupialia) to 6 (in the mole), the most common number being 4. In the Cetacea, the rudimentary pelvis is loosely connected with a single vertebra, and there cannot be said to be a sacrum. The *caudal vertebrae*, which in man and the higher apes coalesce to form the *coccyx*, are usually very numerous, 20 or 30 being a common number, and 40 occurring in the long-tailed ant-eater. The form and number of *caudal vertebrae* vary in accordance with the purposes to which the tail is applied; and the special uses of this organ are numerous. For example, in the kangaroo it serves as a third leg when the animal stands erect;

in the American monkeys, and in some of the opossums, it is a prehensile organ; and in the Cetacea and in the beaver it is a powerful instrument of propulsion in water. The *ribs* correspond in number to the dorsal vertebrae, and, as a general rule (excepting in the Monotremata), they are connected superiorly not only with the bodies of two vertebrae, but with the transverse process of one of them, and hence present corresponding articular surfaces. The *sternum* is generally divided into three portions; the middle one, in place of being represented by a single piece, as in man, usually consisting of as many pieces as there are true ribs. It is very short in the Cetacea, and is very long in the Carnivora and Edentata, extending in some cases nearly to the pelvis. In certain cases, in which it is necessary that the anterior members should be endowed with unusual strength, as in the bat, moles, and armadillos, there is a projecting keel upon this bone (as in birds) for the attachment of powerful pectoral muscles.

The cavity of the *thorax*, which is bounded superiorly by the dorsal vertebrae, laterally by the ribs, and inferiorly by the sternum, is completely separated from the abdominal cavity in mammals (but in no other vertebrates) by the muscular septum known as the *diaphragm*, or midriff.

The *scapular arch* in mammals is comparatively imperfect, its coracoid element (see *CORACOID BONES*) not being sufficiently developed, except in the Monotremata, to reach the sternum, or to meet its fellow in the mesial line. Where the scapula has

Fig. 2.—Pelvis of the Echidna: *il*, ilium; *is*, ischium; *p*, pubis; *m*, marsupial bone.

any bony connection with the sternum, it is through the clavicle or collar-bone, which is frequently absent. The *pelvic arch* is always composed of the ilium, ischium, and pubis on either side, and these bones generally coalesce together, as in man, at an early period of life; but in the Monotremata they remain separate. In the implantental mammals (the Monotremata and Marsupialia), the pelvis presents this striking peculiarity, viz. that from the symphysis (or mesial line of union) two additional bones, termed the *marsupial bones*, project forwards and outwards, one of whose functions is to support the *marsupium*, or pouch, which is characteristic of the female marsupials. In the bat, the pelvis is greatly elongated, and the bones do not unite in the mesial line to form

Fig. 3.—Skeleton of Dugong:

In which the pelvis is a mere bony ring.

a symphysis, so that the lower part remains open, as in birds; while in the Cetacea, which have a

posterior limbs to be supported by the pelvis, that organ is extremely rudimentary (see fig. 3), or even entirely absent. As a general rule, the pelvis of mammals is never so broad as in the human subject, and its lateral walls are always relatively smaller, flatter, and longer.

The *anterior extremities* are always present, although their modes of conformation are very varied, according to the purposes for which they are designed; and the *posterior extremities*, which are also always present, except in the Cetacea, closely resemble the anterior; the difference being greater in man than in any other case, in consequence of the special adaptation of the pelvic extremities for the support of his body in an erect position. The ordinary modifications of these organs are described in the articles *HAND* and *FOOT*.—See *Owen On the Nature of Limbs*.

The *teeth* of mammals constitute so characteristic a feature in their organization, and are of so much service in their classification, as to require a special notice. The only animals of this class in which teeth are altogether absent are the true ant-eaters and the *Monotremata*. The number of teeth is

and, in general, teeth are situated in all these bones. In all existing mammals, except man, there is a vacant space between the incisor and canine teeth. No mammal has more than two sets of teeth; most, however, have two; the first, which are called temporary, deciduous, or milk teeth, being displaced, and succeeded by the permanent teeth, as shown in fig. 4. For a description of the structure and principal forms of these organs, we must refer to the article *TEETH*, and to Professor Owen's magnificent *Odontology*.

The *digestive apparatus* (of which the teeth may be considered a portion) acquires its greatest completeness and elaboration in this group. The leading differences which it presents, and which depend mainly on the nature of the food, have been already noticed in the article *DIGESTION*.

The *organs of circulation and respiration* require no special remark, as, in all essential points, they closely resemble the corresponding organs in man. See *CIRCULATION* and *RESPIRATION*.

The *kidneys* of mammals generally agree with those of man in their internal structure. See *KIDNEYS*. In some animals (especially those that live in water), they are much lobulated. In the ox, there are 20 free rounded lobules; in the bear, 40 or 50; in the seal, 70 or 100; while in the true Cetacea, the separate lobules are so numerous as to give a racemiform appearance to the kidney. All mammals are provided with a urinary bladder, in which the excretion may accumulate so as only to require being discharged at intervals. This organ is largest in the Herbivora, and very small in the Cetacea.

The *nervous system* is remarkable for the large size of the brain, and especially of its hemispheres, in comparison with the rest of the nervous system. The surface of the cerebral hemispheres exhibits a more or less convoluted appearance, the number of the convolutions being to a great degree in correspondence with the amount of intelligence of the animal. The hemispheres are united at their lower parts (except in the uniplacental mammals) by a fibrous band or commissure, termed the *corpus callosum*, which does not occur in the other vertebrates. In the lowest mammals, the cerebellum is situated quite behind the hemispheres, so as to be visible from above; as we get higher in the scale, it is more or less covered, in consequence of the prolongation of the hemispheres backwards; until in the highest apes and in man it is almost completely concealed.

The *organs of the senses* are constructed on precisely the same plan as in man. The most important variations are noticed in the articles *EYE*, *EAR*, *NOSE*, &c.

The *muscular system* generally accords with that of man, but presents many remarkable deviations, according to the form of the skeleton, the use of the several organs in the act of locomotion, the natural posture of the animal, &c.

From the structural characteristics and peculiarities of mammals, we turn to that class of animals in their relations to man.

The uses to which mammals are subservient are almost innumerable, and will readily suggest themselves.

The number of species of existing mammals is estimated by Leach at 2067, of which about 160 are found in Europe (about 60 being peculiar to that continent), 240 in Africa, 250 in Asia, 400 in America, and from 60 to 70 in Australia. Arranging them in orders, there are 65 species of Cetacea, 177 of Ruminantia, 35 of Pachydermata, 6 of Solidungulae,

Fig. 4.—Lower Jaw of a young Pig (from Owen's *Mammalia*):
a, indicates the incisor; c, a canine; p, a premolar; and m, a molar tooth.
When the letter d is prefixed, the tooth is a deciduous or milk tooth.

generally much more restricted than in reptiles or fishes. In most mammals it is the same as in man—viz., 32; but the typical number, according to Owen, is 44. The largest number of teeth occurs in the armadillos (in one species of which are 96 simple molars), and in the dolphins, which have from 100 to 190 teeth. When the teeth are in these excessive numbers, they are small, nearly equal, and usually of a simple conical form, but excepting in these cases, most mammals have particular teeth for special purposes; thus, the front teeth (fig. 4, a), from being commonly adapted to effect the first coarse division of the food, are called cutters, or *incisors*, and the back teeth (m), which complete its comminution, grinders, or *molars*; while the large conical pointed teeth (of which there is never more than one in each half jaw), which are specially adapted for holding the food while the animal tears it asunder, are called holders, *laninaries*, or more commonly *canines* (c), from being well developed in the dog. The incisors and canines may be absent, but except in the cases previously mentioned, the molars are always present. The mode in which the teeth are implanted in the jaw is characteristic of the class. Excepting in those teeth which grow from persistent pulps (as the front teeth of the Rodents, for example), the dental cavity is closed in at its extremity, and the tooth is prolonged into a fang, which is implanted in a socket lined by periosteum, to which the exterior of the fang is firmly adherent; there being never a continuous ossification or anchylosis of the tooth to the jaw. Again, the fang of the molars is usually divided into two, three, or even four divergent processes, and there is no known fish or reptile in which even a bifid fang occurs. Teeth are confined in this class to the maxillary, pre-maxillary, and lower maxillary bones, and form only a single row in each;

MAMMALIA—MAMMARY GLAND.

35 of Edentata, 617 of Rodentia, 33 of Pinnipedia, 413 of Carnivora (including Insectivora), 328 of Cheiroptera, and 221 of Quadrumana; while the order Bimana contains the single species Man.

The subdivision of the mammals into these orders closely approximates to that of Cuvier, as may be seen by a reference to the following table of its sub-classes and orders of the mammalia:

	Order.	Family or Genus.	Example.	
UNGUICULATA	BIMANA,	<i>Homo</i> ,	Man.	
		QUADRUMANA	<i>Catarrhina</i> ,	Ape.
			<i>Platyrrhina</i> ,	Marmoset.
			<i>Strepsirrhina</i> ,	Lemur.
	CARNARIA (the CARNASSIERS of Cuvier)	<i>Cheiroptera</i> ,	Bat.	
		Insectivora	Hedgehog.	
			Shrew.	
			Carnivora	Mole.
	Bear.			
	Dog.			
	Seal.			
	MAMMIFALIA	<i>Didephys</i> ,	Opossum.	
		<i>Phalangista</i> ,	Phalanger.	
		<i>Macropus</i> ,	Kangaroo.	
		<i>Phascogale</i> ,	Wombat.	
Without canines, RODENTIA	<i>Claviculata</i> ,	Rat.		
	<i>Non-claviculata</i> ,	Hare.		
	<i>Bradyptus</i> ,	Sloth.		
	<i>Dasyptus</i> ,	Armadillo.		
Without incisors, EDENTATA	<i>Myrmecophaga</i> ,	Ant-eater.		
	<i>Monotremata</i>	Echidna.		
	<i>Ornithorhynchus</i> .	Elephant.		
	<i>Proboscidea</i> ,	Hog.		
PACHYDERMATA	<i>Ordinaria</i>	Tapir.		
	<i>Solidungula</i> ,	Horse.		
RUMINANTIA,	<i>Herbivora</i> ,	Sheep.		
	<i>Ordinaria</i> ,	Dugong.		
CETACEA		Whale.		
UNGULATA,				
MUTILATA,				

This classification is given in the present article because, although imperfect in many respects (for example, in placing the sloth above the horse, the bat above the dog, and the hedgehog above the elephant), it has been retained in a large number of popular works. In consequence of these obvious imperfections, subsequent attempts at new classifications have been made by several of the most eminent zoologists, some of whom, as Waterhouse and Owen, have taken the brain, and others, as Milne-Edwards, Gervais, and Vogt, the placenta, as the basis of classification. Our limited space forbids us from discussing the merits of these systems. The grounds on which Professor Owen bases his cerebral classification may be found in his essay *On the Classification and Geographical Distribution of the Mammalia*, 1859; while the arguments in favour of the placental classification may be found in Professor Huxley's *Lectures on Classification*, published in the *Medical Times* for the year 1863.

Fossil Mammalia.—The remains of mammalia are generally found in a fragmentary condition; but there is a valuable compensation to the student of these higher organisms, for in them the parts are so differentiated that the smallest fragment—a tooth or a bone—often tells more to the comparative anatomist than the complete skeleton of some of the lower classes.

No relics of mammalia have been detected in the Palæozoic rocks, the earliest we are acquainted with belong to Secondary strata. These are the remains of *Microlestes* from the Keuper, unless the jaws of the *Dramatherium* from an American coal-bed, which is probably of Triassic age, be older. The *Microlestes*, of which the teeth only have been found in Germany and in Somerset, is considered by Owen to have been allied to the small marsupial and insectivorous *Myrmecobius* of Australia. The next remains of this class have been found in the Stonesfield slate, a member of the Oolite. They consist of teeth and lower jaws, which have been referred to four genera, three of which are thought to have been marsupial Insectivora, while the other (*Stereognathus*) was a placental mammal, probably a hoofed, and consequently a herbivorous animal, allied to the Eocene *Hyrcotherium*. Mr Beckles has recently

found the remains of twelve or thirteen species belonging to eight or nine genera of mammalia—placental and marsupial—in the Purbeck beds, the newest of the Oolites. The great series of the Chalk formations has hitherto yielded no mammalian fossils. We are certainly acquainted with only a small fraction of the mammals of the Secondary measures. When more continued and careful research is made, greater results must follow. Mr Beckles recently uncovered 22 yards square of the very thin dirt-bed of the Purbeck, from which previously the remains of only a single species had been obtained, and this very limited space yielded up to him the remains of no less than twelve or thirteen new species.

As we rise through the Tertiary deposits, the number of mammalia greatly increase. Nearly fifty species were described by Cuvier from the Eocene strata of the Paris basin; and since his time, numerous additions have been made by Owen and others. They are chiefly pachyderms, belonging to the genera *Palæotherium*, *Anoplotherium*, *Hyrcotherium*, &c.; but with them are associated the remains of an opossum and of several carnivorous animals. Not only do the number of species increase in the Miocene beds, but they represent a larger number of Orders. There have been discovered two monkeys, numerous proboscidean pachyderms, as the *Dinotherium*, *Mastodon*, and *Elephant*, two or three cetaceans, an enormous ant-eater, and several carnivora. The fossils of the Pleistocene and Pleistocene beds are still more numerous, and represent a race of animals not unlike the living fauna, but generally of a gigantic size. The elephants, elk and bears of Europe were the contemporaries of immense sloths and armadillos in South America, and of huge kangaroos and birds in Australia. Associated with the bones of some of these extinct species have been found flint implements, and even the bones of man, but under circumstances that have caused great difference of opinion amongst observers as to their true age. See MAN.

MAMMARY GLAND, ANATOMY OF. See BREAST.

MAMMARY GLAND, DISEASES OF. The

following are some of the most important of these affections.

Acute inflammation of the breast, which is characterised by great swelling, tenderness, pain, and fever. There is a knotty feeling in the inflamed part, and matter soon forms; but the abscess is often slow in pointing. The affection may occur at any period of lactation, and sometimes arises from very trifling causes—as a loaded state of the bowels, too stimulating a diet, &c. The bowels should at once be cleared out by sharp purgatives; leeches and fomentations should be applied; the arm on the affected side should rest in a sling; and an opening should be made where matter can be felt. The milk should also be regularly drawn off, if it can be done without extreme pain.

Sore nipples are a frequent cause of the preceding disease. Amongst the remedies for excoriations, cracks, fissures, and ulcerations of the nipple which cause great pain in suckling, are the application of strong astringent lotions (tannin lotion, for example), touching the sore point with solid nitrate of silver (lunar caustic), and especially the application of collodion. In bad cases, a metallic shield must be placed on the nipple, to protect it from the clothes and from the child's mouth. The regular application of a liniment of rectified spirits and olive oil in equal parts will sometimes prevent this affection.

The mammary gland is also liable to hydatid disease (see HYDATIDS), to the morbid growth known as chronic tumour, serocystic disease, or glandular tumour, &c., and to Cancer (q. v.).

MAMMEE APPLE (*Mammea Americana*), a highly esteemed fruit of the West Indies (where it is sometimes called the *Wild Apricot*) and tropical America. It is produced by a beautiful tree of the natural order *Guttifera*, 60–70 feet high. The fruit is roundish, from the size of a hen's egg to that of a small melon, with a thick leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its bitter taste. The pulp is firm and bright yellow, with peculiar sweet and very agreeable taste, and a pleasant aromatic odour.—A similar fruit is produced by *Mammea Africana*, an African species.

MAMMOLA, a town of South Naples, in the province Calabria Ultra, seven and a half miles from Gerace. It stands in a beautiful and fertile district on the Locarno. Pop. (1859) 8108.

MAMMOTH, the Russian name for the fossil elephant, whose remains are so common in the recent deposits of Northern Europe. For a description of it, see the article FOSSIL ELEPHANT. The name is sometimes erroneously given to the mastodon.

MAMMOTH CAVE, the largest known cavern in the world, is in Edmonson County, Kentucky, United States of America, near Green River, 130 miles south-south-west of Lexington, on the road to Nashville. It consists of a series of caverns, with communicating passages, and has been explored to a distance of ten miles. In the cavern, is a river crossed by a boat; two kinds of fishes have been caught in its waters: one without eyes, the other with eyes, but blind. Stalactites hang from the limestone rocks, and the earth is rich in nitre. The equable temperature and nitrous atmosphere of the cavern having been recommended as a remedy for diseases of the lungs, a hotel was built in one of the larger chambers of the cave, for the accommodation of consumptive and asthmatic patients; but the use of it has been long discontinued. There are many circumstances to prove that the Mammoth

Cave is part of the course of a subterranean river which existed in a former condition of the surface.

MAMUN, ABU'L ABBAS ABDALLA AL, Calif of Bagdad, of the Abbaside dynasty, and son of HARUN AL-Raschid, was born in Bagdad, 786, and brought up along with his brothers under the care of the most illustrious men of the time. In 800 A. D. he was invested with the government of Khorassan; and after dispossessing his elder brother, Al-Amin, who had ascended the throne on the death of their father, became calif, 4th October 813. His reign was disturbed by internal dissensions, and rebellions of the outlying provinces. Africa and Yemen declared themselves independent, the subjection of Egypt, Syria, and Mesopotamia was merely nominal, but the rest was well and beneficently governed. Civilisation advanced with rapid strides; ruined towns and devastated tracts were restored; and distributions from the royal treasury made to those who had suffered from earthquakes, drought, or any other unavoidable cause. In 827, M. abjured the orthodox religion, and joined the heterodox sect called Motasalis, compelling a number of his subjects to follow his example. Towards the close of his reign, a war broke out with the Greek emperor Theophilus, and soon afterwards M. died, 9th August 834. M. was the most learned and liberal of the Abbaside califs, and is said to have expended 300,000 dinars (£137,500) on the translation of the works of the ancient Greek philosophers into Arabic, these works having been presented to him by the Byzantine emperor. He highly encouraged mathematics and astronomy, founded observatories at Bagdad and Kasinn (near Damascus), caused a degree of latitude to be measured, and the obliquity of the ecliptic to be estimated. His new city of Bagdad became the abode of men of science and letters, who flocked to it from all quarters; and M. himself personally superintended their labours. M. has left three works, two of which are on religious subjects.

MAN. Under this heading, it is proposed to consider various topics relating to the physiology and natural history of man, which have not been treated of in independent articles, such as the development of the physical qualities of man, the distinctive characteristics of man, and the antiquity of the human race. The question of the races or varieties of man has been already discussed in the article ETHNOLOGY; and for information regarding the mental and social nature of man, the reader is referred to the articles ETHICS, INSTINCT, INTELLECT, MIND, &c.

In tracing the development of the physical qualities, we shall follow the arrangement pursued by Quetelet in his celebrated treatise *Sur l'Homme*.

It is a very remarkable fact, the true causes of which we do not know, that more boys are born annually than girls. Taking his data from the principal European states, M. Bikes (quoted by Quetelet), who has collected more than seventy million of observations, finds that in Europe generally 106 males are born to 100 females. In Great Britain, the ratio is not quite so high, being 104.75 to 100. To some extent, the age of the parents influences the sex of the children, and Mr Sadler was led to the conclusion, that 'the ratio in which the sexes are born is regulated by the difference of age of the parents, in such a manner that the sex of the father or the mother will preponderate beyond the average of the total number of births, according to the party which has the excess of age.'

The probable value or duration of life immediately after birth is, in general, about 25 years in Belgium (Quetelet), 32.2 in France, 33 years in England

(Rickman), and 47·2 in Geneva (Lombard). Towards the age of five years, the chances of prolonged life for both sexes is greatest, ranging from 48 to 50 years. It is impossible to state with scientific precision what is the natural length of man's life, when all abnormal disturbing causes are removed; but so few persons exceed the age of 100 years, that a century may be taken as the limit of man's existence.

The development of the height, weight, and strength, at different ages, has been studied by Quetelet, J. D. Forbes, Danson, and others. From a large number of observations made by Quetelet in Belgium, he deduces the following conclusions:

1. From birth there is an inequality both in weight and height between children of the two sexes: the average weight of a boy at birth being 3·20, and that of a girl 2·91 kilogrammes (1 kilogramme = 2·2 lbs.); the height of a boy being 49·6, and that of a girl 48·3 mètres (1 mètre = 3·28 feet). 2. The weight of a child diminishes slightly towards the third day after birth, and does not begin to increase sensibly until after the first week. 3. At equal ages, the boy is generally heavier than the girl. It is only at about the age of 12 that the individuals of both sexes are of the same weight. Between 1 and 11 years, the difference in weight ranges from a kilogramme to a kilogramme and a half; between 16 and 20, it is nearly 6 kilogrammes; and after this period, 8 to 9 kilogrammes. 4. When man and woman have attained their full development, they weigh almost 20 times as much as at birth; while their height is about $3\frac{1}{4}$ times greater than it was at that period. 5. In old age, man and woman lose about 6 or 7 kilogrammes in weight, and 7 centimètres in height. 6. Man does not acquire his complete growth till after he has completed his 25th year; he attains his maximum weight at 40, and begins to waste sensibly after his 60th year. 7. Woman attains her maximum weight at the age of 50. During her reproductive period, the increase of her weight is very slight. 8. The weight of individuals who have been measured, and who were fully developed and well formed, varies within extremes which are nearly as 1 to 2; while the height varies within limits which at most are as 1 to $1\frac{1}{4}$, as may be seen from the following observed values:

	Maximum.	Minimum.	Average.
Weight of man, . . .	99·8 kilog.	49·1 kilog.	63·7 kilog.
" woman, . . .	53·8 "	39·8 "	55·2 "
Height of man, . . .	1·890 mètres,	1·476 mètres,	1·684 mèt.
" woman, . . .	1·740 "	1·408 "	1·579 "

Quetelet has instituted a series of experiments on the strength of persons of both sexes at various ages. He determined both the lumbar power (the weight that could be carried on the back) and the power of the hands by means of Regnier's dynamometer.

From his tabulated results, it appears that the lumbar power of females differs less from that of males during childhood than subsequently. During childhood, the lumbar power of boys is about one-third more than that of girls; towards the age of puberty, one-half; while in adult life it is more than twice as great. The average strength of a well-developed man is 89 kilogrammes, or nearly 19 kilogrammes more than his weight in his dress, so that such a man might hold on for a short time by a rope with a weight of 19 kilogrammes attached to his body. From experiments on the power of the hands, it appears that the manual power of the male sex is greater than that of the female at all ages. Before puberty, the ratio is 3 to 2, and it afterwards becomes 9 to 5. It also appears that the hands acting together produce a greater effect than the sum of the effects they produce when

acting singly; and that the right hand is about six-sixth stronger than the left.

Principal Forbes has made a series of experiments on English, Scotch, and Irish students, which, in most respects, are strongly confirmatory of Quetelet's results, but which evince the superior development of the natives of this country, especially in strength. The following numbers are selected from Forbes' tables:

WEIGHT IN POUNDS, INCLUDING CLOTHES.

Age.	English.	Scotch.	Irish.	Belgian. (Quetelet).
16	127	128·5	139	117·3
20	144	146·5	148	143·9
24	150	152·5	155	149·5

HEIGHT IN INCHES, INCLUDING SHOES.

Age.	English.	Scotch.	Irish.	Belgian. (Quetelet).
16	65·5	65·8	67·2	64·1
20	68·7	69·1	69·8	67·9
24	68·9	69·3	70·2	68·2

STRENGTH IN POUNDS.

Age.	English.	Scotch.	Irish.	Belgian. (Quetelet).
16	336	314	336	286
20	385	398	418	330
24	402	421	431	357

If we proceed to compare the human figure with that of the animals which in their form approximate most closely to man (viz., the anthropoid apes), the chief point that strikes us is the great relative size of the human brain-case and brain, and the comparatively small size and vertical direction of the face; the great length and muscularity of the lower extremities, and their adaptation to the erect position; the adaptation of the hand to the great variety of actions of which it is capable, due mainly to the fact, that the thumb can be opposed to the extremities of all the fingers, whether singly or in combination; the greater breadth of the pelvis, &c.

Those, however, who are inclined to support Mr Darwin's hypothesis, maintain, that whatever system of organs be studied, the comparison of their modifications in the ape series leads to one and the same result—that the structural differences which separate man from the gorilla and the chimpanzee are not so great as those which separate the gorilla from the lower apes. This by no means implies that the structural differences between man and the highest apes are small and insignificant; it is admitted, on the contrary, 'that they are great and significant; that every bone of a gorilla bears marks by which it might be distinguished from the corresponding bone of a man; and that, in the present creation, at any rate, no intermediate link bridges over the gap between *Homo* and *Tropidopithecus*.'—Huxley.

The last point we shall notice is: When did Man first appear upon the surface of the globe? All that can be definitely stated upon this subject is, that the geological researches of Boucher de Perthes, Falconer, Prestwich, Sir Charles Lyell, and many others, shew that while it is impossible to fix the date of Man's appearance, or even to approximate to it, there is apparent evidence of his existence far beyond that which is assigned by our popular chronology. The flint implements which have been discovered in the lower gravels of Abbeville and elsewhere, have been already noticed in a special article, and their occurrence in association with the fossil bones of extinct mammals, and the other evidence of their antiquity deduced from their geological position, have been there described.

The Brixham caverns afford similar and corroborative evidence of the antiquity of man. They were discovered accidentally in 1856 by the roof of one of them falling in. Below a thick stalagmite crust, which formed their floor, and which contained some of the bones of the cave-bear, was a mass of leam of an ochreous red colour, in some parts 15 feet in

thickness, in which were found remains of the mammoth, an extinct rhinoceros, the cave-bear, &c., and from various parts of these deposits flint-knives were obtained. Under the bone-deposit was a bed of gravel, which in some parts was more than 20 feet thick. It contained no fossils, but even in its lowest parts were found specimens of flint-knives. The fabricators of these knives must have lived long antecedently to the time when the work of their hands was covered with stalagmite; and contemporaneous with the stalagmite must have been the cave-bear, whose bones were imbedded in it. The numerous caves of South Wales (Gower), Somersetshire, Sicily, &c., yield results of a similar nature.

There is reason to believe that in the island of Sardinia the land has risen 300 feet since man inhabited its shores, possessing at that time the art of fishing by nets and of making a coarse pottery. The western extremity of the island of Crete has been raised about 25 feet since the construction of its ancient ports, which are now high and dry above the sea. Supposing the movement to have been uniform and equal in the two islands, the mussel-beds of Cagliari (in Sardinia) must have emerged from the sea more than 20,000 years ago; but before that time, man fished the waters over them; if Count De la Marmora is right in conjecturing that a flat ball of baked earthen-ware, with a hole through its axis (which was found imbedded among them), was used for weighting a fishing-net.

Our last illustration shall be taken from the New World. Agassiz estimates that the southern half of the peninsula of Florida, which is built up of coral reefs, took 135,000 years to form; and hence he would estimate the age of the human jaws and teeth, and bones of the feet found in one of the coral banks, to be 10,000 years old.

For further information on this interesting and difficult subject, we must refer the reader to Sir Charles Lyell's work *On the Antiquity of Man*. It is right to add, that many still dispute the conclusions drawn from these facts, see *Transactions of the British Association* for 1863.

MAN, ISLE OF, is situated in the Irish Sea, in N. lat. 54° 3'—54° 28', and W. long. 4° 18'—4° 47'; the shortest distance between the island and the adjacent countries being from Point of Ayre to Burrow Head in Scotland, 18 miles. The length of the island is 33½ miles, breadth 12½ miles, and area about 180,000 acres, of which more than 90,000 are cultivated. At the south-western extremity is an inlet called the Calf of Man, containing 800 acres, a large portion of which is under cultivation. A chain of mountains extends from north-east to south-west, the highest of which is Snæfæll, 2024 feet above the mean sea-level: from its summit, the view is very imposing; the picturesque glens and undulating country in the foreground; the rich plains of the north and south of the island in mid-distance; and beyond, the Irish Sea, bounded by the high lands of the surrounding countries, on which even the corn-fields may be descried. Several streams take their rise in these mountains, in some of which trout abound, though in many the fish have been destroyed by the washings from the lead mines. The coast-scenery from Maughold Head on the east, passing south to Peel on the west, is bold and picturesque, especially in the neighbourhood of the Calf, where Spanish Head, the southern extremity of the island, presents a sea-front of extreme grandeur.

The greater part of the island consists of clay-slate under various modifications. Through the clay-schist, granite has burst in two localities, in the vicinity of which mineral veins have been discovered, and are extensively worked. Nearly 3000 tons of lead are extracted annually, as well as considerable

quantities of copper, zinc, and iron; the lead ore is very rich in quality, as much as 108 oz. of silver having been occasionally extracted from the ton. Old red sandstone and conglomerate are found in the neighbourhood of Castletown and Peel. The carboniferous rocks exist only in the south, extending from Port St Mary to Derby Haven: these consist of three classes, viz., the lower carboniferous limestone; the upper carboniferous, consisting of a mass of fossils; and what has been termed Posidonia Schist, or Poolvash black marble, which is extensively used for mantel-pieces, &c. Trap-dykes intersect the whole of the southern district, especially on the south-west side of Castletown Bay, where the Stack of Scarlett forms a conspicuous mass of basaltic rock. Greenstone is found in many parts of the mountain-chain. There is no trace of coal. Terraces of drift-gravel at various elevations evidence frequent changes of sea-level.

The island is divided into six *sheerings*; these into parishes, of which there are seventeen; these, again, into *treas*; and, lastly, into *quarterlands*.

The towns are Castletown (q. v.), the capital and the seat of government, Douglas (q. v.), Peel (q. v.), and Ramsey (q. v.).

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLETOWN), probably the most perfect building of its date extant, was founded by Guthred, son of King Orry, in 947. The ruins of Rushen Abbey, dated from 1154, are picturesquely situated at Ballasalla. There are numerous so-called Druidical remains and Runic monuments throughout the island.

The population of the island was, in 1861, 52,469; in 1851, 52,387; the small rate of increase being attributable to emigration. The language spoken by the natives is a dialect of the Celtic, and is closely allied to the Gaelic and the Erse or Irish. As a spoken language, it is likely to become almost entirely disused in the course of another generation.

The climate is remarkable for the limited range of temperature, both annual and diurnal; westerly and south-westerly winds greatly predominate; easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles, fuchsias, and other tender exotics flourish throughout the year. The following data are the result of observations as published in the Registrar-general's Reports, taking an average of seven years, ending September 1860: Summer (June, July, and August), mean temperature, 56°-17; Autumn (September, October, November), mean temperature, 49°-97; Winter (December, January, February), mean temperature, 40°-90; Spring (March, April, May), mean temperature, 44°-70; mean annual rain-fall, 30.2 inches.

The fisheries afford employment to nearly 4000 men and boys. More than 600 boats of various tonnage are employed in the herring and cod fisheries, the average annual produce being above £60,000. In addition to these, about 500 English and Irish boats arrive at the island during the fishing season. Besides the herrings consumed fresh, there are about 40,000 barrels cured, each barrel containing 800 herrings. In 1862, 2439 vessels of 178,681 tons entered and cleared from the Isle of Man.

Agriculture has of late years made considerable progress. Tracts of the finest wheat-land are in the vicinity of Castletown, and in the north of the island. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are inconsiderable.

The revenue derived from the island by the British government amounts to about £35,000 per annum; of which more than £29,000 is received from customs' duties, the remainder being the land

revenues of the crown, such as mine royalties, lords' rents, &c.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fine fleet of swift steamers. There is a submarine telegraphic cable between Maughold Head and St Bees Head, near Whitehaven.

Previous to the 6th c., the history of the Isle of Man is involved in obscurity; from that period, it was ruled by a line of Welsh kings, until near the end of the 9th c., when the Norwegian, Harald Haarfager, invaded and took possession of the island. According to tradition, in the beginning of the 10th c., Orry, a Dane, effected a landing, and was favourably received by the inhabitants, who adopted him as their king: he is said to have been the founder of the present Manx constitution. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III. of Scotland, 1266 A.D.; this transference of claim being the direct result of the disastrous failure of the expedition of Hacon of Norway against the Scots in 1263. On the death of Alexander, the Manx placed themselves under the protection of Edward I. of England by a formal instrument dated 1290 A.D.; on the strength of this document, the kings of England granted the island to various royal favourites from time to time until the year 1406, when it was granted to Sir John Stanley in perpetuity, to be held of the crown of England, by rendering to the king, his heirs, and successors, a cast of falcons at their coronation. The Stanley family continued to rule the island under the title of Kings of Man, until James, the 7th Earl of Derby, adopted the humbler title of Lord, on his accession to the government. In 1651, the island was surrendered to a parliamentary force by Receiver-general Christian, who had raised an armed body against the government, which was then in the hands of the Countess of Derby: the parliament having thus obtained possession of the island, granted it to Thomas Lord Fairfax. On the Restoration, the Derby family were again put in possession. On the death of James, 10th Earl of Derby, without issue in 1735, James, 2d Duke of Athol, descended from Amelia Sophia, youngest daughter of James, the 7th Earl of Derby, became Lord of Man. The Isle of Man having been for a long period the seat of an extensive smuggling-trade, to the detriment of the imperial revenue, the sovereignty of it was purchased by the British government, in 1765, for £70,000, the duke still retaining certain manorial rights, church patronage, &c. After negotiation and sales from time to time, the last remaining interest of the Athol family in the island was transferred to the British crown by John, the 4th duke, in January 1829; the amount paid for the island having amounted in the aggregate to £487,144.

The Isle of Man forms a separate bishopric under the title of Sodor and Man. The bishopric of the Sudoreys, or Southern Isles, was for a time annexed to Man, hence the title of Sodor, which is still retained, the name having been applied to the islet of Holm Peel, on which the cathedral church of the diocese stands. This bishopric is said to have been founded by St Patrick in 447. The Manx Church has its own canons, and an independent convocation. The see is, for certain purposes, attached to the province of York. There are in the island about 40 places of worship in connection with the Established Church of Man. The livings are, with few exceptions, in the gift of the crown. The principal denominations of dissenters are represented in the island.

The Isle of Man has a constitution and govern-

ment of its own, independent of the imperial parliament. It has its own laws, law-officers, and courts of law. The legislative body is styled the Court of Tyrdwald, consisting of the Lieutenant-governor and Council—the latter being composed of the Bishop, Attorney-general, two Deemsters (or Judges), Clerk of the Rolls, Water Bailiff, Archdeacon, and Vicar-general—and the House of 24 Keys, who are the legal representatives of the people. On a bill being introduced, it is separately considered by both branches, and on being passed by them, is transmitted to her Majesty for the royal assent; it does not, however, become law until it is promulgated in the English and Manx languages on the Tyrdwald Hill, an artificial mound near the centre of the island, which has been used for the purpose from time immemorial.

The ancient arms of the Isle of Man were a ship with her sails furled; these were continued until 1270, when the present arms were substituted, viz. *gules*, three legs of man in armour, conjoined at the fesse at the upper part of the thighs, flected in triangle, garnished and spurred, *or*, with the motto on garter surrounding, *Quocunque jeceris stabit*.

Works of reference: *The Isle of Man, its History*, &c., by the Rev. J. G. Cumming, M.A., F.G.S.; *History of the Isle of Man*, by Joseph Train, F.S.A. Scot. For climate as adapted for invalids, see *Consumption in its Early and Remediable Stages*, by Dr E. Smith, LL.B., F.R.S.

MANAAR, GULF OF, lies between the west side of the island of Ceylon and Hindustan, and is divided from Palk's Passage on the north by the islands of Ramisseram and Manaar, and by a low reef called Adam's Bridge. At its north-east extremity, it is 80 miles in width; while at its south-western limit it reaches a width of nearly 200 miles.

MANACA (*Franciscea uniflora*, or *Hopeana*), a plant of the natural order *Scrophulariaceae*, a native of Brazil. The whole plant, and especially the root, is found to be of great value in exciting the lymphatic system. It is nauseously bitter, purgative, emetic, emmenagogue, and alexipharmic; in overdoses, an acrid poison. It is much used in Brazil as a remedy for syphilis.

MANACOR, a town in the island of Majorca (q. v.), in a fertile plain, 30 miles east of Palma. It manufactures brandy, wine, oil, and verdigris, and has a population of 10,500.

MANASSEH (from Heb. *Nascha*, to forget, signifies 'one who causes to forget'), the name of the eldest son of Joseph.—At the Exodus, the tribe of Manasseh is said to have counted 32,200 warriors, and on entering Canaan, 52,700. It received land on both sides of the Jordan. The eastern half embraced the rich pasture-lands of Argob and Bashan, as far as the slopes of Hermon; the western extended from the Jordan to the Mediterranean, and lay between Ephraim and Issachar.—MANASSEH was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 699 B.C., at the age of 12, and reigned, according to the narrative, for 55 years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. The sacred writers cannot otherwise express their sense of the enormity of his guilt, than by saying that the very heathen never went so far in their practice of abominations as Judah did in those days. His subsequent history is differently related in *Chronicles* and in the *Book of Kings*.—The apocryphal composition called the *Prayer of Manasse* is received as canonical by the Greek Church.

MANATEE, or **LAMANTIN** (*Manatus*), a genus of herbivorous Cetacea or *Manatida* (q. v.), readily distinguished by the rounded tail-fin, and further characterised by the presence of small flat nails at the edge of the swimming paws, and by the structure of the grinders, which have square crowns with two transverse ridges. The species, which are all inhabitants of tropical coasts, feed not only on algae, but on the plants which grow along the shore, and are rendered accessible to them by the tide, which, after it has retired, often exhibit plain proofs of their browsing. They live chiefly in shallow bays and creeks, and in the estuaries of rivers, and often ascend rivers to a great distance from the sea. The best known species (*M. Americanus*) is found in the West Indies and on the western coasts of tropical America. It sometimes attains a length of 20 feet, and a weight of three or four tons. The skin is very thick and strong, and is almost destitute of hair. The fingers can be readily felt in the swimming paws, and, connected together as they are, possess considerable power of motion, whence the name *M.* (from Lat. *manus*, a hand). The *M.* is usually found in herds, which combine for mutual protection when attacked, placing the young in the centre. When one is struck with a harpoon, the others try to tear out the weapon. The females shew great affection for their young. No animal is more gentle and inoffensive than the manatee. It has been tamed and rendered familiar enough to come for food when called. Vast numbers were formerly found in places where it is now comparatively rare, as its capture is easy, and its flesh—which has been variously likened to beef and pork—is held in considerable esteem. A common name for the *M.* is Sea-cow.—Another species is found on the coast of Florida, and a third on the west coast of Africa.

MANATIDÆ, a family of *Cetacea*, including all the herbivorous section of the order. Besides the distinguishing characteristics mentioned in the article *CETACEA*, they differ from the ordinary *Cetacea* in having swimming paws rather than pectoral fins. It has been supposed that some of the stories of mermaids may have originated in the females of some of the *M.* being seen with the head and breasts raised out of the water. There are three genera of *M.*, described in the articles *DUGONG*, *MANATEE*, and *STELLERINE*.

Manch.

MANCH, or **MAUNCH** (Fr. *manche*), a frequent charge in English heraldry, meant to represent a sleeve with long pendent ends, of the form worn by ladies in the reign of Henry I. Or, a manch gules, has

been for a long time the arms of the Hastings family, one of whom was steward of the household to Henry I.

MA'NCHA, or **LA MANCHA**, a district of Spain, in the province of Ciudad Real, and the southernmost part of the kingdom of New Castile. See *CASTILE*.

MANCHE, a maritime department in the north-west of France, formed from the most western district of the old province of Normandy, derives its name from *La Manche* (the English Channel), which washes its coasts. Greatest length, 98 miles; average breadth, 27 miles; area, 1,426,289 acres. Pop. (1862) 591,421. Of the entire area, 940,047 acres are cultivated, and about 235,000 acres are in meadow. The surface of the department is irregular; hills of no great elevation traverse it from north to south. The Vire, the Douve, and the Selune are the chief rivers. The

climate is mild and temperate, but somewhat humid. Flax, hemp, and fruit are extensively cultivated. Immense quantities of apples are grown, from which 44,000,000 gallons of cider are made annually. Horses of the true Norman breed are reared in the pastures, and excellent cattle of large size are bred in the valleys. The department is divided into the six *arrondissements* of St Lô, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St Lô.

MA'NCHETER (Sax. *Mancestre*), a city, municipal and parliamentary borough of Lancashire, and the great centre of the cotton manufacture of the north-west of England, stands on the Irwell, 32 miles east-north-east of Liverpool, and 188 miles north-north-west of London by railway. On the west side of the Irwell is the borough of Salford, communicating with that of *M.* by means of a number of bridges, and considered as virtually a portion of the city.

By the census of 1861, the inhabitants of the parliamentary borough of *M.* were 357,604, and the increase from 1851 was 41,391. In the adjoining borough of Salford, the population, in 1861, was 102,414, the increase from 1851 having been 17,306. The area of the borough of *M.* is 9.9 square miles; of Salford, 7.9 square miles. Both boroughs were enfranchised by the Reform Bill, *M.* returning two members, and Salford one member to parliament. *M.* was incorporated in 1833, and Salford in 1844. *M.* was made a bishopric in 1847, and received the title of city in 1853. Water for the supply of *M.* is collected on the Lancashire side of Blackstone Edge, at Woodhead, and conducted from a series of reservoirs through iron-pipes, nearly 20 miles, to the borough. The water-works, in which are invested about £1,430,000, and the gas-works, involving about £450,000, belong to the corporation. The manorial and market rights were also acquired by the corporation in 1845 for the sum of £200,000. There are four public markets in *M.*, and two in Salford, besides the cattle-market. Smithfield Market in *M.* is more than four acres in extent, and is entirely covered in. The market-tolls of *M.* alone amount to £16,000 per annum. The sale of gas makes a profit of some £40,000 per annum, which is devoted to improvements in the borough. In 1845—1846, a public subscription founded three public parks of about thirty acres each; and *M.* was the first borough to take advantage of the Free Libraries' Act, which allows an appropriation of a penny in the pound on the local assessment for parks, libraries, and museums; and here was established the first free lending library in England. Three branch lending libraries and a museum have since been established in *M.*, and one reference library and an excellent museum in Salford; so that, including the old college library founded by Sir Humphrey Cheetham, 1662, the people have the free use of upwards of 100,000 volumes of ancient and modern literature.

The two boroughs have 68 churches belonging to the establishment. The cathedral, formerly the *Old Church*, built 1422, is a very fine Gothic structure, and has latterly undergone a very extensive process of restoration in its original style. There are 10 Roman Catholic and 101 dissenting chapels, some of which, especially the Catholic Cathedral and Cavendish Independent Chapel, are very beautiful specimens of modern Gothic architecture. There are 2 Jewish synagogues, 2 German churches, and 1 Greek church. The principal public buildings for secular purposes are the Town Hall, the Royal Infirmary, the Royal Exchange, the Royal Institution, all in the Grecian style; the Free Trade Hall, in Composite; and the new

Assize Courts, in decorated Gothic. The assize courts cost about £100,000. Many of the warehouses of the merchants are palatial in appearance, and the business transacted is quite in accordance with the magnitude of the buildings. The floor of the Royal Exchange contains about 1800 square yards, and is yet too small for the numbers who throng it on market-days. M. has four private and five joint-stock banks, besides branches of the Bank of England, and the National Provincial Bank. The assessment of municipal M., in 1862, was £1,514,721, and of Salford, £360,000. The celebrated Bridgewater Canal connects M. with Liverpool, and access is also obtained for heavy barges by the Irwell and Mersey, and by railway (the first great work of the elder Stephenson). See CHAT MOSS. The London and North-western; the Lancashire and Yorkshire; the Manchester, Sheffield, and Lincolnshire; and the Manchester, Altrincham, and South Junction Railway Companies have access to M. by their own lines; whilst the Great Western, the Great Northern, the Midland, and the North Staffordshire have running powers over the other lines.

The chief trade is spinning and manufacturing cotton, but there are also considerable manufactures of silk and mixed goods, of small-wares, of machinery and tools; and M. is also a dépôt for all kinds of textile fabrics, and does a very large export trade. In 1860, M. had 95 cotton mills, 13 silk mills, 16 small-ware mills, 37 dye-works, 48 iron foundries, and 63 machinists' workshops. There are ordinarily employed in the cotton mills about 60,000 persons, who earn about £30,000 per week in wages. There are at least 7000 skilled mechanics constantly engaged in the production of steam-engines, spinning-mules, looms, and other machinery, chiefly for the production of the various textile fabrics, whose wages average about 28s. each per week, and who need some 1500 labourers to assist them.

The educational endowments of M. are small compared with its great population. There is a hospital school for 100 boys, founded by Sir Humphrey Cheetham, and incorporated by Charles II.; there is also a free grammar-school, with about 300 pupils, founded 1519, by Hugh Oldham, D.D., Bishop of Chester. There is a school, called the Jubilee School, for orphan girls; and there are also schools for the deaf and dumb, and for the blind, which are all supported by voluntary subscription. In 1864, a secular school for 350 boys was established, in order to prove that children of all the various sects could be advantageously taught together, and it has since been kept up by voluntary subscription for the education of children whose parents are wholly unable to pay. In a parliamentary inquiry in 1853, the number of day-scholars in M. was shewn to be 27,000, and the Sunday-scholars 52,000, and in evening schools and literary institutions from 4000 to 5000 pupils. In 1846 John Owens, a Manchester merchant, left £100,000 in the hands of trustees to found a college for secular instruction; and in connection with that institution, there are now 92 day and 287 evening students, of whom 17 matriculated in the examination of the University of London in 1863. The college is well conducted, and is steadily rising in popularity. A mechanics' institution was commenced in 1824, and is still carried on successfully. It has day and evening classes, a good library, and reading-room, and all the necessary appliances for secondary education. Similar institutions on a smaller scale exist in Salford, and in the out-townships of Longsight, Rusholme, Harpenhey, Cheetham Hill, and Fendleton. In M. originated the agitation for free-trade (see ANTI-

CORN-LAW LEAGUE). M. was also the first place to secure the privilege of inland bonding for articles chargeable with customs-duties, and now produces a large revenue from that source.

Camden, who died in 1622, says: 'Where the Irk runs into the Irwell, on the left-hand bank, and scarce three miles from the Mersey, stands that ancient town called in *Antoninus* (according to different copies), *Mancunium* and *Mannutium*. Perhaps, as an inland town, it has the best trade of any in these northern parts. The fustian manufacture, called *Manchester cottons*, still continues there; this with a great variety of other manufactures, called *Manchester wares*, renders not only the town itself, but the parish about it rich, populous, and industrious.' The parish of M. covers a large area, reaching to Stockport, Oldham, and Ashton-under-Lyne, and in the early part of the 18th c. was reckoned to have 20,000 communicants.

MANCHESTER, a city of New Hampshire, United States of America, on the east bank of the Merrimac River, at the falls of Amoskeag, 18 miles south of Concord, 59 miles north-west of Boston. The town is laid out in broad streets, shaded with elms, with five public squares. The falls of 54 feet in a mile afford water-power to ten manufacturing companies, with factories of cotton, paper, locomotives, hardware, &c. There are also extensive print-works and starch-mills. There are fourteen churches, forty public schools, seven banks, two daily and five weekly newspapers. Pop. in 1838, 50; in 1860, 20,107.

MANOHINKEL (*Hippomane Mancinella*), a tropical American tree of the natural order *Euphorbiaceæ*, celebrated for the poisonous properties of the acrid milky juice with which every part of it abounds. A drop of this juice, which is of a pure white colour, burns like fire if it falls upon the skin, and the sore which it produces is very difficult to heal. The Indians of tropical America use it for poisoning their arrows. The fruit is in form, colour, and scent not unlike a small apple—the name is from the Spanish *mancinella*, a small apple—and contains a nut about the size of a chestnut. The fluid which the fruit contains is milder than that of other parts of the tree, but its acridity is so great as immediately to repel any who, tempted by its appearance and citreous fragrance, may ignorantly attempt to eat it. The leaves are alternate, ovate, serrate, and shining. It is said that, owing to the volatile nature of the poisonous juice, persons have even died from sleeping under the shade of the M. tree. Much seems to depend on the state of the atmosphere, and there is good evidence that rain or dew falling from the branches of the M. does produce injurious effects. The fruit of M., dried and pulverised, is diuretic; the seeds are excessively so. The wood is of fine quality, and well suited for cabinet-making. Whole forests of M. at one time existed in Martinique, which have been burned down. It grows chiefly in the vicinity of the sea. *Cameraria latifolia*, another West Indian tree, of the natural order *Apocynaceæ*, is called BASTARD M., from its resemblance to M. in its poisonous properties.

MAND. See EXECUTION.

MANDAMUS is a prerogative writ which issues from the Court of Queen's Bench, and in some cases a similar writ issues also from the other superior courts of law, whereby the court commands some public body, or inferior court, or justices of the peace, to do something which it is their legal duty to do, and the neglect of which there is no other way of redressing.

MANDARIN, a general term applied to Chinese officers of every grade by foreigners. It is derived from the Portuguese *mandar*, to command; the Chinese equivalent is *tsuen*. There are nine ranks, each distinguished by a different-coloured ball or button placed on the apex of the cap, by a peculiar emblazony on the breast, and a different clasp of the girdle. The balls are ruby, coral, sapphire, a blue opaque stone, crystal, opaque white shell, worked gold, plain gold, and silver. Theoretically, these grades are indicative of relative merit, but as office and titles are sold to a great extent, the competitive examinations, which are the only legitimate road to distinction, have lost much of their value. A mandarin is not allowed to hold office in his native province, the intention being to prevent intrigue, and to draw to Peking the ambition and talent of the country, where temporary employment is given in subordinate offices, prior to appointments to the provinces. He is not allowed to marry in the jurisdiction under his control, nor own land in it, nor have a near relative holding office under him; and he is seldom continued in office in the station or province for more than three years—a system of espionage which serves further to strengthen the imperial government. It is incumbent on every provincial officer to report on the character and qualifications of all under him, which he periodically transmits to the Board of Civil Office; the points of character are arranged under six different heads, viz., those who are not diligent, the inefficient, the superficial, the untalented, superannuated, and diseased. According to the opinions given in this report, officers are elevated or degraded so many steps in the scale of merit, like boys in a class. They are required also to accuse themselves when remiss or guilty of crime, and to request punishment.

MANDATE is a contract by which one employs another to manage something gratuitously for him. The one is called a mandant, and the other a mandatory; the term being derived from the Roman law of *mandatum*. In England, in consequence of the doctrine, that a simple contract cannot be enforced unless there is some consideration for it, or a *quid pro quo*, it is held that if the mandatory undertakes to do the work, but omits to do so, no action will lie against him, though it is otherwise if he once enter upon the work, in which case he is bound for the consequences of anything injurious or negligent. If the duty or work is undertaken, the mandatory is bound to use reasonable skill and diligence. In Scotland, where a consideration is not necessary to make a valid contract by word of mouth or writing, the mandatory is liable to an action if he has contracted or agreed to act. In Scotland, the word mandatory is used to denote a person who, in a litigation by a foreigner or person residing out of Scotland, undertakes to give security for costs, in the event of the mandant losing the suit, otherwise the suit is not allowed to go on in Scotland.

MANDAVI, the chief seaport of the principality of Cutch, Hindustan, on the north shore of the Gulf of Cutch, in lat. 22° 51' N., long. 69° 26' E. Though there is no regular landing-place, boats of any size can land at the sandy beach, and large vessels find secure anchorage in the offing at a distance of about three miles from shore. Its wells are numerous, and full of water. Pop. variously estimated at from 50,000 to 90,000.

MANDEVILLE, SIR JOHN, an old English traveller, born at St Albans about the year 1300. Prompted by curiosity or love of adventure, he left his native country about 1327, visited the Holy
